VOL. XI.

MAGNETISM—MOTRIL.

593
Entered, according to Act of Congress, in the year 1861, by D. APPLETON AND COMPANY, in the Clerk's Office of the District Court of the United States for the Southern District of New York.

Among the Contributors to the Eleventh Volume of the Revised Edition are the following:

Prof. CLEVELAND ABBE, Washington, D. C. 
METEOROLOGY.

Mass. 

HENRY CAREY BAIRD, Philadelphia. 
Mint. 

Prof. C. W. BENNETT, D. D., Syracuse University. 
Methodism. 

JULIUS BING. 

MARIE ANTONETTE, MAXIMILIAN, Emperor of Mexico, 
MOLTKE, HELMUTH KARL BERNHARD VON, Count, 
and other articles in biography, geography, and history. 

FRANCIS O. BOWMAN. 
MARENZIO, LUCA, 
MARSCHNER, ADOLPH VON, 
and other articles in biography, geography, and history. 

EDWARD L. BURLINGAME, Ph. D. 
MONKS, GEORGE, Duke of Albermarle, 
and other articles in biography and history. 

Rev. CHARLES P. BUSH, D. D. 
MISSIONS, FOREIGN (Protestant). 

ROBERT CARTER. 

MAMMOUTH, 
MAMMOTH, 
MAMMALIA, 
MAMMALS, 
and other articles in biology and history. 

JOHN D. CHAMPLIN, Jr. 
MANUSCRIPT, 
MINERALS, 
MOROCCO, 
MOSCOW, 
and other articles in bibliography and geography. 

Prof. JOHN A. CHURCH. 
MINERALOGY. 

Prof. E. H. CLARKE, M. D., Harvard University. 

MERCURY (in Medicine), 
and other articles in materia medica.

Mississippi River.
Magnetism, the name given to the phenomena displayed by magnets. If a bar of slightly tempered steel be held vertically and struck several blows with a wooden mallet, it will acquire the property of attracting iron filings at its two extremities. The same property may be communicated from one bar of steel to any number of similar bars, by rubbing one half of the length of each of the latter with the end of the former which was toward the earth in the experiment above mentioned, and the remaining half with the other end of the same bar. In this process a remarkable fact becomes evident, namely, that the bar which is employed to impart the magnetic property loses none of its own power; on the contrary, if the process is properly performed, it will become stronger; and hence we deduce the conclusion, that in magnetization there is no transfer of any substance from one body to another, but the development of a latent principle. If a magnetized bar be suspended by a fibre of untwisted silk, in such a manner as to have perfect freedom of motion, it will assume a N. and S. direction; that is, it will exhibit the phenomena called polarity. If to either end of a magnetized bar thus suspended a piece of soft iron be approached, attraction will be exhibited between them; when a similar bar is rolled in iron filings, the latter will be found to adhere in thick clusters at the two ends or poles, while none will attach themselves to the middle of the bar. If, instead of presenting to the suspended magnet pieces of soft iron, we bring near to its two ends in succession the two poles of another magnetized bar, repulsion as well as attraction will be exhibited; and by an attentive study of the phenomena we shall find that similarly magnetized ends repel, and dissimilarly magnetized ends attract each other. These forces act at great distances, through all interposed bodies, and like gravitation diminish in intensity with the square of the distance from each pole. If a number of bars of soft iron be placed near each other in the same straight line, and the N. end, for example, of a strongly magnetized steel bar be brought near one end of the series, each piece of iron will become magnetic and exhibit polarity. The near end of the first magnet will be a S. pole, the far end a N. pole, and so on throughout the series, as follows:

\[ N \ S \ N \ S \ N \ S \ N \ S \ N \]

When the magnet is removed, the polarity of the iron bars ceases; and when the pole of the developing magnet is reversed, the polarity of the whole series is also reversed. The development of magnetism in this way is called induction, and by it we are enabled to explain many facts which would be otherwise perplexing. In accordance with this principle, we can assert that a magnet does not attract soft iron in its natural state, but that it first renders the metal magnetic, and then the attraction takes place between the dissimilar poles of two magnets. Again, when we sprinkle iron filings on a paper placed over a magnetic bar, they arrange themselves in beautiful curves radiating from each pole and joining near the equator of the bar. These lines result from the fact that each particle of iron becomes by induction a separate magnet, and attracts the adjacent filings, their arrangement in this case being the same as that of a series of small needles when under the influence of the two poles of a magnetic bar. The induction takes place readily in soft iron, and disappears as soon as the inducing magnet is removed, but not so with hardened steel; though the effect is less powerful in this, the polarity is permanent.—The method of making steel magnets of great power, which we have found from long experience the sim-
Magnetism

plest and most efficient, is as follows: Procure say ten flat bars of good steel bent into the usual form of a horse shoe; let these be well hardenend and fitted with their flat sides togethe so as to form a compound magnet. Each of the members of this bundle may be magnetized separately to a small degree by supporting one of the legs on the lower end of a long rod of iron held nearly perpendicular in this latitude, and the other leg on the upper end of the same rod; or by rubbing one leg with the N. pole of a magnetized bar and the other with the S. pole. The several shoes, or bars, being in this way feebly magnetized, eight of them are joined together with their similar poles in contact, forming a compound magnet with which the remaining two bars are to be magnetized to a higher degree. For this purpose the latter are placed on a table on their flat sides, the N. pole of the one in contact with the S. pole of the other, so as to form a closed circuit; on any part of this circuit the compound horse shoe is placed perpendicular to the plane of the table, with its N. pole in the direction of the S. pole of the bar or shoe on which it rests, and then caused to slide in either direction entirely around the circuit, care being taken to retain its perpendicularity. After having gone over the surface of the two shoes in this way several times, they are turned over without separating their ends, and the process is repeated on the side which was previously under. By this method the two bars will receive a magnetic power nearly equal to the sum of the powers of the eight magnets in the bundle. Next these two bars are placed in the bundle, and two others are taken out and subjected to the same process. These in turn are put into the bundle, and two others are taken out and rubbed in the same way, until each pair of bars has been gone over two or three times in succession. By this method, with the most feeble beginning, the magnetism of the several shoes may be developed to their full capacity, and a magnetic battery produced of great power. A compound horse shoe of this kind is the most convenient instrument for magnetizing straight bars of hardened steel for practical uses. Suppose, for example, we wish to magnetize four bars, each 16 inches long, an inch wide, and an eighth of an inch thick; these are placed on their flat sides in the form of a rectangular parallelogram with their ends in contact; the compound horse shoe is then placed perpendicularly on the middle of one of the bars, and slid entirely around the parallelogram, several times in succession; each bar is then turned over in its place so as to bring its lower side upward, and the process repeated, care being taken to keep the horse shoe perpendicular to the plane of the parallelogram, and its poles in the same relative positions to those of the bars. By this method, if the compound horse shoe is sufficiently powerful, the four bars can be magnetized to saturation in the course of a few minutes. If there are but two bars to be magnetized, the parallelogram is completed by joining the ends of these with two similar bars of soft iron, and the same process of rubbing performed as before.—We have seen, in the article Electro-Magnetism, that the most powerful magnetic induction is produced in soft iron by transmitting around a bar of this metal a current of galvanism, and that temporary magnets of great power can be produced in this way. The same method affords the readiest means of strongly magnetizing steel bars. Whatever may be the nature of the change which takes place in iron at the moment of magnetization, we are certain that it pertains to the atoms or molecules of the body, and not to the assemblage of these as a whole. To be convinced of this, it is only necessary to magnetize a steel rod, for example a thick knitting needle, the polarity of which will be exhibited near its two ends, while no attraction will be manifested near the middle. If however we break this into two pieces, we shall find each half is a perfect magnet; the separated ends which were previously joined together in the middle of the whole length will now exhibit polarity. If each of these pieces be again broken in two, we shall have four perfect magnets; and however frequent the division or small the parts into which the needle is divided, each part will still exhibit a N. and S. pole. We may continue, at least in thought, this division, and we have no reason to doubt that however far it might be carried, the same result would be produced. We infer from this experiment that the reason why the middle of a bar exhibits no magnetism is not that none really exists there, but that it is neutralized by opposite polarities. We are also certain that magnetization is attended with at least a momentary motion of the atoms of the iron. This is proved by the fact that during the sudden magnetization of a bar of iron, by means of a current of electricity transmitted through a spiral conductor enclosing the bar, a sound is emitted; and if the bar be rapidly magnetized and demagnetized by an interruption of the current, a musical sound will be produced. This fact was first noted by Dr. Page of the United States, and subsequently experimented upon by De la Rive, Beequerel, and others in Europe. The fact that a change takes place in the molecules is also rendered evident by an experiment of Mr. Joule of Manchester, England, in which he found that, although the whole capacity of the iron bar did not change on being magnetized, yet its dimensions varied, its length being increased, and its width correspondingly diminished. That the magnetic force resides on or very near the surface of a magnet has been shown by Jamin, who finds that for every magnet there is a certain relation between the quantity of magnetism and the solid and superficial contents, such as to establish a limit beyond which a given bar cannot exert magnetic
power. (See Comptes rendus, Paris, June, 1874.) Again, in the magnetization of iron, it is found that time is required to produce a full effect, as if it were necessary that inertia should be overcome; and Mr. Grove has shown that, in rapidly changing the polarity of a bar by means of an alternating current of electricity, the iron increases in temperature. The fact that a magnet heated to a white heat permanently loses its magnetism is well known; and in general the magnetism is diminished by any elevation of temperature. Dr. Magge of Verona asserts that a circular plate of homogeneous iron, when magnetized, conducts heat better in a direction perpendicular to the line joining the poles than in the direction of this line itself. It is also stated that iron strongly magnetized resists the action of the file in a greater degree than in its ordinary state.—It was formerly supposed that magnetism could be developed only in iron, nickel, and cobalt; but we now know from the researches of Faraday, that all bodies exhibit signs of an inductive influence, provided the magnetic power applied be sufficiently great. From the results of his experiments, Faraday was led to divide all bodies into two great classes: those like iron, nickel, and cobalt, which, on being suspended between the poles of an electro-magnet, assume an axial direction, were denominated magnetic bodies, or paramagnetic; while those which arrange themselves at right angles to the magnetic meridian were denominated diamagnetic. (See Diamagnetism.) The following series exhibits some of the last results obtained by Faraday on the magnetic and diamagnetic powers of bodies, in which the angle of torsion necessary to balance the force of a magnet expresses the power of the various substances, volume for volume, + representing the paramagnetic bodies, and — the diamagnetic: proto-ammoniate of copper, +134°23'; oxygen, +17°5'; air, +3°45'; nitrogen, +0°3°; carboxic acid gas, +0°6°; hydrogen, —0°1°; glass, —15°2°; pure zinc, —74°6°; alcohol, —78°7°; wax, —80°73°; nitric acid, —87°96°; water, —96°6°; sulphuric acid, —104°47°; sulphur, —118°; bismuth, —196°76°. Faraday discovered another remarkable evidence of the action of magnetism on liquids and solids, as manifest in the effect produced on a polarized beam of light. Let a piece of glass pipe 18 inches long be closed at each end with a plate of tourmaline and filled with water. Let the axes of the tourmaelines be placed transversely, so that the polarized beam of light which passes through the first may not be transmitted through the second. If while the apparatus is in this condition the iron be magnetized by a current of electricity passing through a long wire helix surrounding the tube, the beam of light will be partially transmitted by the second tourmaline. It is evident from this result that the magnetization of the iron has produced an effect on the particles of the liquid, which has enabled them to react on the polarized beam of light and to produce as it were a twist in its plane of polarization. A similar result will be produced if the liquid be contained in a tube of glass or any other substance, and placed between the poles of a powerful magnet. To observe the effect however in this case, the poles of the magnet should be perforated for the transmission of the light. A similar effect is produced upon solid transparent bodies, and particularly upon heavy glass of the silicio-borate of lead. The phenomena of magnetism admit of being investigated quantitatively and mathematically without adopting any particular ideas as to the fundamental nature of this force; the most complete investigations of this kind have been those of J. Clerk Maxwell ("Treatise on Electricity and Magnetism," Oxford, 1873), who has been able thus to show the profound significance of Faraday's lines of force, and to make some progress in the reduction of this study to a dynamical science. Quite recently Bichat has published a very extended experimental investigation of this subject, and among other things has established the fact that the power of this magnetic influence diminishes as the temperature rises. Faraday also discovered the fact that crystallization exerts a considerable influence upon the direction of crystallized bodies placed between the poles of a powerful electro-magnet; Plucker found that the axis of crystallization tended to assume the axial or equatorial direction; and Tyndall and Knoblauch established the fact that if the molecules of any body are more condensed in one direction than in any other, the magnetism will act along this direction with greatest intensity. If the substance is paramagnetic, the line of greatest condensation will assume an axial position; if diamagnetic, the same line will come into a state of rest in the equator. This is shown by mixing carbonate of iron with gum into a stiff paste, a disk of which being compressed between the fingers, so as to give a greater density in one direction, and afterward suspended between the poles of a powerful electro-magnet, will settle with its line of greatest condensation in the axial direction. If a similar experiment be made with a compound of powdered bismuth and gum, the line of greatest condensation of this factitious substance will assume an equatorial position.—Various attempts have been made to show a direct magnetizing influence in the solar beam to develop magnetism in soft iron needles, and it has even been asserted that the direct radiation from the moon has a powerful disturbing effect upon the needle of the mariner's compass; but the most delicate experiments made by these been qualified for such investigations have failed to exhibit any result of this kind.

MAGNETISM, Animal. See Animal Magnetism.

MAGNETISM, Terrestrial. Gilbert in 1600 was the first to announce the bold hypothesis that
the earth is a great magnet, and that the needle assumes a N. and S. direction because it is attracted by the dissimilar and repelled by the similar poles of the terrestrial sphere. He illustrated this hypothesis by magnetizing small globes of steel; but this illustration, though it served in a general way to represent the phenomena, is not strictly correct. In the first place, the magnetism of the earth is not symmetrical like that of a steel magnet, but is to a considerable degree irregular; and secondly, it is not permanent, but subject within certain limits to almost continual changes both in direction and intensity. Indeed, the magnetic needle is scarcely ever absolutely stationary from one moment to another, but is constantly exhibiting minute variations. If the earth is a magnet, the free needle at any place should assume a definite direction; but it does not follow from the hypothesis that this direction must be the true north and south, since the magnetic poles of the earth do not necessarily coincide with its geographical poles. If the two poles be in the same meridian with a given place, the needle will at that place point to the true north; but if the magnetic pole lie either W. or E. of the meridian of a given place, the N. end of the needle will deviate either E. or W. of the true north, and the phenomenon of the declination or variation of the compass will be exhibited. That the needle does not point to the true north had long been known, and it was observed by Columbus in his first voyage of discovery that the direction of the needle is not the same for all portions of the earth. Thousands of observations have since been made to obtain the data for constructing charts to represent for the use of the mariner the declination in various parts of the earth. Again, if we assume that the earth is a great magnet, it will follow that in passing from the magnetic equator, the needle which is accurately balanced, so as to settle horizontally at the former place, will incline or dip as we advance to either pole. That this is really the fact was first discovered by Robert Norman in 1576. Furthermore, if the earth is a magnet, we should expect that the magnetic intensity or the strength of the action would not be the same at all points of its surface, and this inference has also been found to be true. By counting the vibrations of a delicate dipping needle, we find that the strength of the magnetism of the globe increases as we go from the equator toward the pole. The magnetic intensity, however, exhibited by observations of this kind, does not indicate as rapid an increase of force as we approach the magnetic pole as might be expected from such a distribution of magnetism as would result from a magnetized sphere of iron. In conformity with the three magnetic elements we have mentioned, namely, the variation, the dip, and the intensity, it is customary to represent the magnetic condition of the earth at a given time by three systems of lines supposed to be drawn on the surface of the globe. These are as follows: 1, the line drawn through all places where the needle points to the true north or south, to 5° W., to 5° E., 10° W., and 10° E., and so on, called the isogonic lines, or lines of equal variation or declination; 2, lines nearly at right angles to the former, drawn through all places exhibiting the same angle of dip of the needle, called isoclinal lines; and 3, a system of lines joining all places having the same magnetic intensity, and consequently known by the name of isodynamic lines. It is a problem of much practical importance in regard to the art of navigation, as well as to the study of the phenomena of terrestrial magnetism, that these three systems of lines should be accurately determined; and accordingly expeditions have been fitted out by different nations almost expressly for this purpose. All the observations, however, which have been made in regard to them, indicate the fact that they are not permanent, but are constantly undergoing a change, of which the law is exceedingly complex. Halley's chart of declination for 1700 is very different from that of Barlow for 1689; and Hansteen's dip chart for 1780 does not represent the isoclinal lines of the present day. The great practical object then of investigation in this branch of science is to discover the law of these changes, in order that, the position and form of these lines being determined for a given epoch, they may be calculated for any future time. The phenomena were first referred to a very small magnet at the centre of the earth, the direction of which is subject to irregular changes. Tobias Mayer, instead of supposing a magnet to be placed at the centre of the earth, conceived one to be situated at about the seventh part of the earth's radius from the centre, and from this hypothesis he was enabled to calculate the variation and dip in places not far distant from those in which these quantities had been determined by actual observation. Hansteen of Norway, who collected an immense number of observations, endeavored to represent the phenomena by the hypothesis of two small eccentric magnets of unequal strength placed at the centre of the earth, giving rise to four magnetic poles, two in each hemisphere. In order to represent the variations of the needle, the poles of each of these two magnets were supposed to perform a revolution around an intermediate line, with different velocities. Gauss of Gottingen, however, made the first rigid investigation of the problem in accordance with a definite plan. He founded his research on the assumption that the terrestrial magnetic force, or that which is exerted on a needle freely suspended by its centre of gravity, is the resultant action of all the magnetized particles of the earth's mass. According to this assumption, the governing power which affects the needle is due to the magnetism of the earth itself, while the different perturbations to which the needle is subjected are the results of extraneous forces.
To give clearness of perception, he represents magnetization as consisting in the separation of two magnetic fluids, giving magnetic polarities to each particle, or in other words in a repulsive and attractive force acting inversely as the square of the distance. No change would be produced in the result by adopting the hypothesis of Ampère, in which magnetism is held to consist of constant magnetic currents; nor would there be any difference if terrestrial magnetism were ascribed to a mixed origin, as consisting partly of actual electrical currents and partly of permanently magnetized masses. Starting from these assumptions, Gauss obtained a general mathematical expression for the action of the whole globe on a magnetic needle, however irregular might be the distribution of the magnetism of the former. In other words, he obtained an expression by which, if the distribution of the magnetism of the earth were known, and the intensity of its action ascertained with reference to a unit of distance and intensity, the position of the needle and the magnetic force by which it was acted upon at any point could be determined; and conversely, if the action of the earth on the needle were known for a large number of places on the surface of the earth, the distribution of the magnetism might be considered the unknown quantity, and might be approximately found from the data thus afforded by observation. In this way Gauss was enabled to give a method of constructing general charts to represent in every part of the earth the magnetic declination, inclination, and isodynamic lines, the intensity and direction of the magnetic force being known at a given number of places. The data necessary for improved charts of this kind have been furnished by the magnetic surveys made in various parts of the world in recent times, at the suggestion and principally under the direction of the British association. By repeating the construction of such charts for different epochs, the secular changes in different parts of the earth will become known; and it is hoped that, in due time, if the system of magnetic observations which has been established should be continued, the law of the changes will ultimately be fully ascertained. The investigations of Gauss have shown that the hypothesis of two movable magnets at the centre of the earth does not explain the phenomena of terrestrial magnetism. He defines a magnetic pole to be the place at which the needle points directly downward, or at which the dip is 90°. Indeed, he has pointed out the very obvious fact, that if there be two such points in the northern hemisphere, then there must be somewhere between the two a third point at which the needle would also assume the vertical position. Gauss, however, arrives at the remarkable conclusion that the place of greatest magnetic intensity does not coincide with that which is usually denominated the pole; and it would appear that there may be a diffused space in the northern hemisphere around which the isodynamic lines may be drawn, representing apparently at least two centres of greater magnetic attraction. These phenomena are best represented by the hypothesis of magnetism due to currents of electricity in the earth, but as yet no definite hypothesis has been advanced as to the nature of such currents. It is true, they have been referred to thermo-electricity; but how the varying heat of the sun or the high temperature of the interior can give rise to currents constantly circulating round the earth, of such intensity and such flexures as would account for the observed direction and intensity of terrestrial magnetism, has not yet even approximately been made out.—What we have said in regard to the magnetism of the earth principally relates to its state at a particular time. We shall now briefly give an account of the discoveries which have been made in regard to the changes to which terrestrial magnetism is subject; and for the data from which these have been deduced science is indebted to the several magnetic observatories established in different parts of the earth. These are furnished with improved instruments, which in their present perfect state constantly record, by means of photography, the minutest changes in intensity and direction of the magnetic force. The magnetic perturbations were at first supposed to consist of two classes, namely, periodical and fitful. Many perturbations, however, which had been regarded as fitful are now known to recur at regular periods, and are therefore not properly designated by this term. The changes of terrestrial magnetism are of three classes. The first consists in a movement of the magnetic poles, around the true poles of the earth, from E. to W. in both hemispheres. This motion is inferred from the secular changes which have been found to affect the position of the magnetic lines, as well as from the secular changes in the position of the magnetic needle at any given station. The magnetic lines at any given epoch present great irregularity of shape, because very slight differences of magnetic declination, due to local peculiarities, may largely affect the position of the magnetic lines. But when the changes of declination at any given station are considered, they are found to correspond, at least during the period within which systematic observations have been made, to an oscillation such as would result from the motion of the magnetic poles around the true poles of the earth in a period of between six and seven centuries. Thus in 1576 the declination needle in London pointed 11° 15' E.; in 1657 or thereabouts the needle pointed due N.; in 1760 it pointed W. by 19° 30'. The westerly declination attained its maximum in 1819, when it amounted to 24°. Since then the needle has been slowly travelling eastward, the present annual rate of decrease being more than 8'. The mean westerly declination for the year 1873 was 19° 80'. Again,
TERRESTRIAL MAGNETISM

in Paris, which lies 2° 20' E. of London, the needle pointed due N. in 1663. Its subsequent motions have closely resembled those of the London needle; but the Paris needle ceased to move westward as early as 1817, and attained a maximum declination of only 221°. Now if we combine these facts with the changes of the inclination, we see at once that they point to a movement of the northern magnetic pole from a position between London and the N. pole in the middle of the 17th century to its present position in the extreme north of the American continent (or rather in the archipelago which lies beyond those parts northward). For in the middle of the 17th century the needle pointed northward, while afterward it pointed westward. Then the magnetic pole lay at that time either directly beyond the N. pole of the earth, or somewhere on (or near) the arc joining London and the N. pole. But if the magnetic pole had lain beyond the true pole, the inclination would have been much less than that corresponding to a magnetic pole at the true pole of the earth, that is, less than 51°. Instead of this, however, the inclination was much greater. Moreover, the inclination, which would then have been at a minimum had the magnetic pole been beyond the true pole, appears to have then been at a maximum. For though exact observations of the inclination have not been made during so many years as observations of the declination, we find that in 1720 the inclination was 74° 42' in London; in 1800, 70° 35'; in 1863, 68° 9'; in 1870, 67° 55'; and in 1873, 67° 45'. The northern magnetic pole was therefore between London and the N. pole of the earth in the middle of the 17th century, and has since travelled westward, or in a direction from E. to W. around the true pole. If we assume the motion to be uniform (which is probably not the case), and that the needle at Greenwich responds uniformly to such motion (which is certainly not the case), we may calculate the period of polar revolution. Thus, taking the magnetic pole as due N. in 1657, and in 1833, according to Ross's observations, as 95° W. of Greenwich, we have for the period of revolution 808 (1833—1657) years = 667 years about.

Combining Ross's estimate with the Paris epoch, we get a period of 865 (1833—1663) years = 644 years about. We may take 650 years as a not improbable period of revolution. It may be added, as confirming the above, that in Russia the magnetic inclination has now reached a maximum, while in Peking it is increasing. The cause of this change is at present entirely unknown; it has analogy with any other class of physical phenomena with which we are acquainted. By a rough comparison of the isothermal lines and the lines of equal magnetic intensity, a general similarity has been observed, and hence the two have been considered as referable to the same cause; but it will be perceived that this analogy does not hold, since the magnetic lines are in constant motion, while the isothermal lines retain very nearly a fixed position, or at least change in comparison with the other lines with extreme slowness.—The second system of changes has evident relation to the annual position of the earth in its orbit round the sun, and its revolution on its axis. These were at first ascribed to the influence of the heat of the sun on different parts of the earth; but they have the remarkable characteristic of exhibiting notably the same amount in the southern hemisphere as in the northern, and in the tropics as in the temperate zones. The magnetic force is found to be greater in the months of December, January, and February, when the sun is nearest to the earth, than in those of May, June, and July, when it is most distant from it; whereas, were the effect due to temperature, the two hemispheres would be oppositely instead of similarly affected in each of these two periods. We must therefore ascribe the effect to the direct magnetism of the sun itself, and consider it established that this luminary like the earth possesses attracting and repelling poles, and that the effects on the needle result from the different positions of the earth in regard to these centres of action. The pole of the needle which is least distant from the sun makes a double diurnal movement in the following manner. It arrives at its greatest western excursion four or five hours before the sun passes the meridian of the place, as if it were repelled; it then turns eastward with increasing celerity, and reaches the limit of its eastern excursion one or two hours after that passage. As the sun passes the inferior meridian, there is repeated in the night the same action as that which took place in the day. To illustrate the action, let us suppose two globes, a larger and a smaller, placed upon the same plane, with their axes of revolution not precisely parallel to each other, as in the case of the earth and the sun; and let us further suppose that one globe is made to revolve round the other, the axis of the former being constantly parallel to itself. It is evident that in one half of the orbit of the moving globe the northern poles will be inclined toward each other, while in the other half of the orbit the southern poles will be similarly inclined; and if we further suppose that the magnetic axis of the sun, as in the case of the earth, does not differ very much from the axis of rotation, we shall have an explanation of the effects observed in the records of the diurnal motions of the needle. The N. end of the needle, which is attracted by the N. pole of the earth, will be repelled by the N. pole of the sun, provided it has dissipar magnetism to that of the earth, and consequently will decline from the sun; and as, on account of the revolution of the earth on its axis, this luminary appears on the E. of every place in the northern hemisphere in the morning and on
the W. side in the afternoon, corresponding variations in the needle will be exhibited. In the other half of the year, for a similar reason, the S. end of the needle will be affected in an analogous but opposite manner; the strength of the magnetism of the earth will be increased by the nearer approach of the sun, in the same way that two magnets having their dissimilar poles opposite each other are increased or diminished in magnetic power by a diminution or decrease of distance. We are indebted for the interesting discovery of the polar action of the sun to Gen. Sabine of England, who has had charge of the reduction of all the magnetic observations of the English colonial observatories; and to Dr. Kriel of Austria for another of the same character, which leads us to extend the principle of magnetism to the moon. It is found that there is a variation of each of the magnetic elements corresponding with the diurnal position of the moon in regard to the earth; but this resembles the tides in exhibiting two maxima and two minima in the course of 24 hours, regularly changing in time with the motion of the moon in her orbit around the earth. These phenomena indicate that the moon is not magnetic per se, that is, possessed of permanent magnetism, but its magnetic condition resembles that of soft iron developed by the compound, but varying inductively influence on account of change of distance of the earth and the sun. That these changes in the magnetic elements cannot be due to heat in this case, must be evident, since the temperature of the moon as a mass is but little greater than that of celestial space.—The third class of variations, which was formerly denominated fitful, is now known in a certain sense to be periodical. They were called by Humboldt magnetic storms, and were found by Arago to accompany the appearance of the aurora borealis. Although it is impossible to assert that magnetic disturbances, the recurrence of individual cases of these great perturbations in the intensity and direction of the magnetism of the earth, yet they are known to increase in number and magnitude of action within the period of a little more than five years, and gradually diminish through nearly an equal period, the whole cycle being completed in a little more than 11 years. The magnetic storms have been observed in the most distant parts of the earth, and no doubt can now exist as to their cosmical character. The lunar influence of which we have just spoken does not appear to participate in or be connected with this inequality. The periodicity of these apparently fitful variations of magnetism was first pointed out by Gen. Sabine, and has since been established by the investigations of Prof. Lloyd of Ireland, Dr. Lamon of Germany, and by those of Prof. Bache from the observations made under his direction at Girard college. But the most astonishing result in regard to this class of perturbations is that they coincide with the periodical recurrence of the maxima and minima of the spots on the sun. A German astronomer, Schwabe, has established, by nearly 30 years of unrelenting daily observation, the periodicity of this phenomenon. He finds that the solar spots increase in magnitude for about 14 years, and diminish through an equal period, the cycle, as in the case of magnetic storms, being completed in about 11 years. The discovery of a connection of this remarkable kind gives to magnetism a high position in the scale of distinct natural forces, and assigns to it equally with gravitation a truly cosmical character. It is not impossible that the spots on the sun may be connected with the falling into its gaseous envelope of meteorites, and this suggestion is favored by an observation of Mr. Carrington of England, in which a remarkable appearance was observed on the surface of the sun, analogous to that which would have been produced by an occurrence of the kind we have mentioned. Recently Prof. Loomis of Yale college has published his analysis of the observations of many past years, apparently placing beyond all question the existence of a connection between the phenomena of the sun's colored prominences and the magnetic activity of the earth. Observations by Prof. Young of Dartmouth college seem to show the extreme probability of such an association. Moreover, the observations which have been made on the prominences, by showing a connection between these objects and the solar spots, seem to force upon us the conclusion that some relation exists between the colored flames and the phenomena of terrestrial magnetism, since the partial dependence of these upon the sun's condition has been very nearly if not quite demonstrated.—It is not intended by what has been said to convey the idea that meteorological changes may not affect the position of the needle, and that even the magnetic condition of the atmosphere, according to the hypothesis of Faraday, may not produce appreciable results; but as yet the actions of these appear to neutralize each other, and to leave no definite record of their existence in the course of periods of considerable length. It is probable, however, that with the improved photometrical instruments and a more minute scrutiny of their records, the effects due to these causes will be shown. Since the agitation of the atoms of an iron bar is found to favor the development of magnetism by induction, it is not improbable that the magnetism of the earth may be disturbed during the continuance and shortly after the occurrence of an earthquake.

MAGNETO-ELECTRICITY. As shown in the article ELECTRO-MAGNETISM, great magnetic power is developed by passing a current of
galvanism around a bar of soft iron; and since in all cases a mechanical action is accompanied by an equal amount of reaction, it is reasonable to suppose that electricity ought to be evolved by magnetism. Various fruitless attempts were however made to obtain this result; the form in which the effect was to appear was unknown, and it was not till 1831 that Faraday succeeded in exhibiting currents of electricity in a wire by means of magnetic reaction. It has also been stated in the same article that, in accordance with the theory of Ampère, all the mechanical properties of an ordinary magnet may be exhibited by currents of electricity transmitted through spiral conductors; and hence, in order to present the phenomena of this class in the simplest form, we shall begin with stating the fundamental facts of what is called electro-dynamic induction, or electricity induced by a galvanic current. 1. Let a portion of a copper wire be extended in a straight line horizontally, and the two ends at a distance be connected with a galvanometer so as to form a closed circuit in which a current may be induced. Let also a portion of another wire, connected with a galvanic battery, be placed parallel to the first, and a current sent through it. If the wire transmitting the battery current be suddenly brought near the wire connected with the galvanometer, during the approach of the second wire toward the first a current of the natural electricity of the latter will pass through the galvanometer in a direction adverse to that of the inducing current. 2. The induced current continues only during the motion of the inducing conductor; when the motion of this is stopped, the induced current ceases, and while the current of the battery remains stationary and continues the same in quantity and intensity, no perceptible effect is exhibited in the adjoining wire. 3. When the inducing current is suddenly moved away from the first wire, a current is observed to pass through the galvanometer in the opposite direction to the former induced current, or in the same direction as the battery current. 4. Let the two wires be placed parallel and near to each other, while the circuit of the battery current is interrupted. If in this condition the current from the battery be suddenly established through the inducing conductor, an induced current of electricity will pass through the galvanometer in a direction adverse to that of the battery current; or in other words, the effect will be the same as that of the approach of the battery current to the inducing wire, as in case 1. 5. During the continuance of the battery current of unimpaired strength and intensity, no disturbance of the natural electricity of the adjoining wire is perceived; but at the moment the current of the battery is stopped by a rupture of the circuit, a current passes through the galvanometer in the same direction as that of the current of the battery. All these phenomena are in accordance with the hypothesis that during the transmission of a current of electricity through a wire, there is exerted in space on every side an inductive action diminishing with the distance which disturbs the natural electricity of any conducting matter which may be brought within its influence; that while the conductor remains at rest within this influence an abnormal equilibrium exists; and when the conductor is removed from this influence, or when the latter ceases, the usual equilibrium is established by a reverse motion. Since, according to the theory of Ampère, magnetism consists of currents of electricity revolving at right angles to the length of the magnetized bar, it follows that analogous results ought to be produced by magnetism; and for this purpose, instead of the battery current in the last series of experiments, let there be substituted a magnetized bar held at right angles to the wire connected with the galvanometer. 1. If this bar be suddenly brought down upon the wire perpendicular to its length, the galvanometer will indicate a current in an opposite direction to the hypothetical current in the lower side of the magnet. If the wire be E. and W. and the magnet be held across it with its N. pole toward the north, the current in the lower side of the magnet will be from the E. to the W., while the induced current will be in an opposite direction, i.e., from W. to E. 2. When the motion of the magnet toward the wire is stopped, the induced current ceases, and no sign of electricity is exhibited so long as the magnet remains at rest. 3. When the magnet is suddenly removed from its proximity to the wire, a current in the opposite direction to that of the first, that is, in the same direction as the current in the lower side of the magnet, is indicated by the galvanometer. 4. When a bar of soft iron is placed across the wire at right angles, and this is suddenly magnetized, either by a galvanic current or by touching its ends to the poles of a horseshoe magnet, a momentary current is produced in the wire in a direction opposite to that of the hypothetical currents of the near side of the magnet. 5. So long as the soft iron bar remains at rest and its magnetism suffers no change, no current is indicated by the galvanometer; but the moment the bar is unmagnetized, a reverse current takes place. The two series of results we have given above are precisely analogous; the latter being merely a case of the former, in which the hypothetical currents of the magnet are substituted for the real current of the battery. — All the effects that we have described are produced with much more intensity, when, instead of using extended wires parallel to each other, we employ wires in the form of spirals, either flat or cylindrical. For example, to obtain an induced current of considerable intensity by means of magnetism, we place on a rod of iron, say four inches long, a spool of long wire covered with silk, which may occupy two inches of the length of the middle of the iron. If the two ends of this rod projecting beyond the spool
be suddenly brought into contact with the two poles of a horse-shoe magnet, an induced current will be developed for a moment in the surrounding wire; and when the same rod is suddenly detached from the poles, a current in an opposite direction will take place; and in this way a continued series of alternate currents may be developed by alternately making and severing the contact of the poles of the magnet and the ends of the rod. A still greater effect may be produced by causing the rod to revolve on an axis at right angles to the middle of its length, before the poles of the magnet, so that each end in rapid succession may be brought in contact first with the N. and then with the S. pole, and so on. Shortly after the discovery by Faraday of the laws we have stated, Mr. Joseph Saxton of this country, then a temporary resident of London, afterword attached to the United States coast survey, invented (1832) the first machine for giving sparks and shocks in accordance with the arrangement we have just described. Instead of a single bobbin of wire on the middle of a straight bar, he employed two, one on each leg of a bar of soft iron bent into the form of a horse shoe, which were made rapidly to revolve by means of a multiplying wheel before the poles of a magnet. At each half revolution the magnetism of the soft iron was entirely reversed, and in this way a series of currents was induced, of sufficient intensity to decompose water, fire combustible bodies, and powerfully to affect the nervous system. An instrument maker in London, who was employed to construct these machines, made a slight change in the arrangement, which principally consisted in placing the inducing horse-shoe magnet in a vertical position, and in causing the spools of wire to revolve in a plane parallel to its flat side, instead of parallel to its poles. This change, instead of improving the instrument, produced an opposite effect, since the strength of the induction was much diminished. The author of it, however, succeeded by advertisements, and an actual exhibition of it in France, in attaching his name to the invention, to the exclusion of that of Saxton. It is, however, gratifying to see that in the German works on the subject, and also in the better class of English publications, justice is done to the original inventor. The next important series of investigations on this subject, after the original discovery of Faraday, was by Professor Henry of Princeton, now secretary of the Smithsonian institution at Washington. He found that at the beginning and ending of the galvanic current in a long wire, an induced current was produced by an action which has sometimes been called the induction of a current on itself. To illustrate this, let the circuit of a small battery of a single element be closed by a short wire of about a foot in length, dipping into a cup of mercury. When the circuit is broken, no spark, or but a very feeble one, will be observed; but if we now substitute for the short wire one of say 100 feet in length and of considerable thickness, a vivid spark will be exhibited when the circuit is interrupted. To obtain this result in the most striking manner, we should employ a copper ribbon at least an inch and a half wide and 100 ft. long, well covered with two thicknesses of silk, and rolled into the form of a flat spiral. At the rupture of a battery circuit of which this forms a part, a loud snap and deflagration of the metal will be produced, when with a short wire, the battery remaining the same, scarcely any but a very feeble spark would be observed. By this arrangement several spires of ribbon react on each other, and increase the effect. By coiling a bell wire covered with silk of 600 or 700 ft. in length into a spiral ring, the intensity will be so much increased that shocks may be obtained by means of a small galvanic battery of a single element. If the same wire be coiled into the form of an elongated spiral, and in the centre of this a rod of soft iron be placed, or what is better, a bundle of iron wire, the intensity is still more excited. In this case the magnetic reaction is combined with that of the current of galvanism, and the two actions being in the same direction conspire to increase the effect. To produce, however, the most powerful inductive apparatus, a bundle of varnished iron wires of about 15 in. in length, and together forming a diameter of about an inch, is surrounded with a coil of thick copper wire well covered with silk of 300 or 400 ft. in length. Around this, but separated from it by a cylinder of glass or pasteboard soaked in shell lac, is coiled a fine copper wire of 4 or 5 m. in length, care being taken that each splice be well insulated from every other. When a current of galvanism from a battery of even a single element is transmitted through the thick copper wire which surrounds the inner core or bundle of iron wire, the latter becomes magnetic; and at the instant the rupture is made in the battery current, a sudden cessation of the magnetism, as well as that of the current itself, induces a current of great intensity, though of small quantity, in the outer surrounding fine wire. Each splice of the long wire in this arrangement is subjected to the inductive influence; and the rapidity of motion of the electricity of the wire, were it not for the increased resistance, would be in proportion to the number of spires, or in other words to the length of the wire. This apparatus has received various ingenious improvements, the principle in all cases remaining the same. Dr. Page was the first to invent an apparatus on this plan by which the rupture of the battery current was rendered automatic; the magnetization of the iron core caused the attraction of a small magnet attached to one end of a lever which broke the circuit, and the consequent disappearance of the same magnetism allowed the end of the lever to fall into a cup of mercury and thus again complete the circuit. This instrument was much enlarged.
and improved by Rubmkorff of Paris, and was still further perfected by an ingenious Ameri-
can artisan, E. S. Ritchie of Boston. The essential desideratum in the construction of this instru-
ment is the perfect insulation of the several spires of wire, so that the intense electricity which is produced may not strike across from one spire to another; and Mr. Ritchie effected this by means of an ingenious process of winding, together with an improved insulation. An appreciable time is required to overcome the resistance of the wire and to give it a full charge of the current of electricity, and also to magnetize iron; hence in the instrument we have described, when a single battery is employed, the induced current, which gives the intense spark, is that which is produced at the rupture of the battery current. We can however increase the intensity at the beginning of the current, by employing a battery of a number of elements, which, producing electricity of greater intensity, more suddenly establishes the current in the wire, and more rapidly develops the magnetism of the iron. The improvements that have been made of late in the construction of magneto-electric or induction machines have been so striking as to warrant the hope that we shall eventually derive great advantages from the powerful electric currents that can thus be instantaneously generated, producing light, heat, or other effects in any locality whither the conducting wires are led. The accompanying figures illustrate the forms of the most notable machines that have been constructed. The first is the machine constructed by the compagnie d'alliance of Paris on the plans of Clarke and Nollet. In Clarke's machine, which is but a slight modification of Saxton's, two soft iron cores, connected by copper and iron bars, revolve rapidly in front of the poles of a powerful horse-shoe magnet. Around these cores is coiled an insulated copper wire, whose ends are so connected with a "commutator" that the alternating currents of electricity circulate always in the same direction through the external circuit. In the machines of the Alliance company the use of the commutator may be omitted if the currents are designed only for the production of light, since in this case the rapid reversals of the current are an advantage. In Siemens's machine, fig. 2, invented in 1854, a
peculiar core replaces the double iron armature of Saxton and Clarke; this is a long cylinder around which a wire is wound lengthwise. The cylinder is made to revolve rapidly between the opposite poles of a series of horse-shoe magnets; the perpetually reversing magnetism induced in the core by the magnets is carried in successive currents by the insulated wire coil to the commutator, and thence through the external circuit. In Wilde's machine, fig. 3, the external current from a small Siemens machine, M, is made to pass through a large coil, A B, enclosing a soft iron horse-shoe bar, which is thereby magnetized and acts as a permanent magnet on a second revolving core, F, larger than but similar to that of the smaller apparatus. The latter core collects a much more powerful current than that first produced, and this can be used to generate a third or higher order of current; but with each such increase of current we increase the power required to turn the cores; and though the heat and light are magnificent, yet in no case can we convert into electrical energy more than a certain per cent. of the mechanical energy consumed. In the machine devised by Ladd in 1867, as shown in fig. 4, a principle has been introduced suggested a short time previously by both Siemens and Wheatstone. Two plates of soft iron, B B', are so placed that if they possess the least initial magnetism, as is ordinarily the case, then the rotation of the Siemens armature, a', collects the currents, which are at once led into the coils about B and B', and thus elevate the original magnetism of the plates to a high degree of intensity. Between the opposite poles of the magnets rotates a second Siemens armature, a, which collects the current for the external circuit. Gramme's machine, invented in 1871, two views of which are given in figs. 5 and 6. it differs materially from its predecessors in that it offers a really continuous current instead of rapid alternations. This is effected by using a circular-ring of soft iron, A A, for the core in which the magnetism is to be induced. The coil of wire around the core offers a continuous metallic circuit, divided into numerous sections, the ends of the wires in each so connected with radial metallic arms, R R, that as the ring rotates the induced current flows continuously from these arms to certain fixed metallic pieces in frictional contact with them, and thence to the external circuit. By dividing the current, one half may be led back to the exciting magnets, S O N, and be used to increase the power of the machine. The effect produced by these machines increases proportionately to the velocity of rotation up to an unknown limit; it also increases with the number of coils encircling the ring core. The machines of the Alliance company have been employed for illuminating purposes at some French lighthouses, and those of Wilde have been similarly employed in Great Britain. The Gramme machine has been used for the illumination of the Victoria tower in London, and in the galvanoplasty works of M. Christofle in Paris.—Currents of Different Orders. An induced current, by its action on a third conductor, may produce another current, and this another, and so on. If we call the current of the battery a current of the first order, the first induced current is named that of the second order, and so on. The discovery and investigation of the principle and properties of currents of the different orders is mainly due to Prof. Henry. On reflecting a little, it will be evident that these currents cannot be produced immediately by placing several straight wires parallel to each other and passing a current of electricity through one of them; in this case the battery current would act on the surrounding wires, and simply produce in each of them an induced current of the second order. To obtain, therefore, currents of the different higher orders, we employ a number of flat spirals, through one of which placed horizontally on a table is transmitted the current from the battery. Immediately above this, and separated from it by a stratum of air or a plate of glass, is a second flat spiral, the ends of which are connected with a third
spiral placed at such a distance as to be entirely out of the influence of the battery current. Placing on the third a fourth (the two being separated as before by a plate of glass), and joining the ends of this with the ends of a fifth spiral, and so on, we shall have a series of successions. The current of the first order induced by the battery current induces a secondary current in the second spiral, which passes through the third spiral, and, thus free from the influence of the battery current, induces a current of the third order in the fourth spiral, which in turn, passing through the fifth spiral, induces a current of the fourth order in the sixth, and so on. Since each induced current must have a beginning and an ending, the current of the third order must in reality consist of two currents in immediate succession and in opposite directions, one produced at the beginning and the other at the ending; and for a similar reason a current of the fourth order must consist of four currents in immediate succession and opposite directions. On this account currents of the higher orders do not definitely deflect the needle of the galvanometer, but merely give it a slight tremor; the impulses in opposite directions follow each other so rapidly that the inertia of the needle is not overcome in the interval between the two. The existence of these currents of different higher orders could not be determined by the galvanometer; they however give intense shocks, and also permanently magnetize steel needles. This latter effect will be understood when it is recollected that, although the series of waves in different directions are the same in quantity, they differ very much in intensity; that at the beginning of the agitation they have much the greatest energy. Hence the currents of different orders exhibit dominant impulses in definite directions. If the direction of the battery current be represented by +, the current of the second order at the beginning of the battery current will be represented by −; the dominant current of the third order +, of the fourth −, and so on; while the series of dominant impulses at the ending of the battery current will be +, +, −, −, +, −, +. When a circular plate of copper or any other conducting substance is interposed between two spirals placed one above the other, and a current from the battery is transmitted through, for example, the lower one, the induced current at the ending of the current of the battery, in the upper spiral, will affect the galvanometer as if no plate were interposed, while the physiological effect, or the power of giving shocks, will be entirely neutralized. This remarkable effect is due to an induced current in the interposed conductor, which is rendered evident by cutting out a slip of the metal extending from the centre to the circumference of the plate; or in other words, by removing one of the radii of which the circular plate may be conceived to be made up, and thus interrupting the circuit, in which an induced current otherwise could be produced; the shocks with this plate thus cut will be nearly as intense as when the plate is entirely removed. The same effect takes place when instead of the plates a third flat spiral is introduced between the first and second spirals; so long as the ends of this spiral are separated, its presence produces apparently no effect; but if the ends be closed so as to form a perfect circuit which can be traversed by the induced current, the power of giving shocks is neutralized. But the question naturally arises as to how the current in the plate affects the current in the upper spiral so as to destroy its power of giving shocks. The explanation of this is to be found in the fact, that while the current in the battery tends to induce a current both in the plate and in the spiral above it, each of these currents tends to induce an opposite current in the conductor of the other; we may therefore consider the upper spiral as being under the influence of the current from the battery, and the influence of the current of the plate; but as the current in the plate produces an equal inductive action in opposite directions at its beginning and ending, the only effect of it will be to prolong the action of the induced current in the upper spiral, or in other words, to diminish the intensity and hence to neutralize its power to give shocks without perceptibly diminishing its effects on the galvanometer. These facts are of importance in the construction of the inductive apparatus previously described; for if two points of two adjacent spires of the long wire happen to be in metallic contact, so as to form a closed circuit, the effect is the same as that of the interposition of a plate or spiral between the battery current and the induced current; the intensity of the latter will be neutralized, and hence the necessity of the perfect insulation of the several spires of the long wire. For the same reason if the latter is enclosed in a hollow cylinder of copper or any other conducting metal so as to separate it from the outer coil of long wire, the great inductive power of the instrument will be neutralized; and it is also on this account that a bundle of varnished iron wires is employed for the core instead of a solid rod of iron. If however the copper cylinder we have just mentioned be interrupted by sawing out a thin slip parallel to its axis, and the solid iron core sawed down from its circumference to its centre, forming a saw-gash in the direction of the radius and in the plane of the axis, the interfering induced currents will be prevented. We have stated that an induced current of considerable intensity is generated in the conductor of the battery itself at the moment of the rupture of the circuit. This also produces, on the principle of the interposed plate, an adverse action which tends to diminish the energy of the induction apparatus; a defect in the instrument which M. Fesso has remedied by causing the rupture to take place in a cup of mercury the surface of which is covered with
oil; the current of the battery is interrupted by drawing the end of the conductor out of the mercury while it still remains in the oil, which being a bad conductor stops in part the induced current. A similar effect is produced by suffering the extra current to expand itself on a large sheet of metal called a condenser. The facts we have here stated have been confirmed and extended by Masson, Verdet, and Acre of France, Dove, Wartmann, Riess, and Lentz of Germany, Marianini of Italy, and Dela Rive de Geneva.—Induced Currents from Discharges of Ordinary Electricity. When a discharge from a Leyden jar is transmitted through two spiral conductors separated by a pane of glass or a stratum of air, induced currents analogous to those we have described are generated of great intensity, and under favorable circumstances the effect may be exhibited at a great distance. Prof. Henry succeeded in magnetizing needles with induced currents at the distance of several hundred yards, by stretching two long wires parallel to each other, and transmitting a discharge from a Leyden jar through one of them. He also obtained inductive effects of the same kind from the discharges of the thunder cloud at a distance of several miles. The direction of induced currents from discharges of the Leyden jar is apparently very capricious; they do not deflect the needle of the galvanometer, and the direction indicated by the magnetization of needles, enclosed in a small helix which forms a part of the circuit, is subject to very complex variations. For example, when the two conductors are near each other, the direction indicated by the magnetization of the needle is opposite to that of the current from the jar. If the two parallel wires or flat spirals be separated to a greater distance, the magnetization of the needle will indicate either a feeble current or one in an opposite direction; and if the distance be still further increased, the opposite polarity of a greater intensity will be exhibited. A change also in the direction of the magnetization of the needle will be produced by an interruption in the circuit of the induced current, or by the proximity of another closed circuit. These results have led European physicists to attempt to ascertain the direction of the current by chemical decomposition and other effects, but the results do not settle the question or throw much additional light on the character of the phenomena. Prof. Henry, however, after a very extended series of experiments, was enabled to refer them all to the peculiarity of the electrical discharge from the Leyden jar. This does not consist of a single discharge from the inside to the outside of the jar, as has been generally supposed, but in a series of discharges forward and backward alternately, until an equilibrium, as it were, is established by a series of oscillations, decreasing in intensity on account of the resistance of the wire, until the normal electrical equilibrium is attained.—Induction in Masses of Metal in motion. Arago in 1824 discovered that when a copper plate is made to revolve rapidly immediately under a magnetic bar freely suspended by an untwisted thread, the motion will be communicated to the latter even through a plate of glass; and also that when a magnetic needle is made to vibrate immediately over a plate of copper, it will come to rest much sooner than when the metal is removed. These facts remained entirely isolated until Faraday showed that they were the results of currents induced in the plate by the action of the magnet. We have seen that when a wire is made to approach at right angles to a magnetized bar, a current is produced in the former opposite to that of the hypothetical current in the near side of the magnet. A similar result must be produced when a plate of metal is moved in the vicinity of a magnetic pole. To illustrate this, let the N. pole of a strong magnetic bar be placed perpendicularly on the middle of an oblong plate of copper, extended in a N. and S. direction; while the bar retains this position, let the plate be drawn in the direction of its axis, say southward, under the magnetic pole. A magnetic bar thus placed with its N. pole downward has hypothetical currents revolving around it from W. to E. on the N. side, and from E. to W. on the S. side. If the plate therefore be moved southward, the N. part, which is approaching the pole, will have induced in it a current in an opposite direction to that of the current in the magnet, which will in this case be a current directed toward the west, while the S. part of the plate receding from the magnet will have currents produced in it in the same direction as those in the magnet; but the currents on the S. side of the magnet are moving toward the west, and hence we shall have on both sides of the magnetic pole of the bar currents directed toward the west during the time the plate is drawn from the north toward the south. If we reverse the motion of the plate, the direction of the system of currents will also be reversed. If the poles of a horse-shoe magnet be furnished with two pieces of iron so as to form acting poles at a small distance from each other, and nearly in the same line, and between these a circular disk of copper be made to revolve on an axis parallel to the line joining the poles, so that the latter shall be near the outer circumference, a system of currents from the centre to the circumference of the plate will be produced; the radii of the plate which are approaching and those which are receding from the line joining the magnetic poles will both conspire to produce this effect. If one end of a galvanometer be brought in contact with the axis of the circular plate, and the other made to touch the circumference while it is thus revolving, a constant current will be indicated by the instrument. If the direction of the revolution of the disk be changed, an opposite current will be produced; or if the velocity of the rotation be increased, a corresponding increase will be observed in the intensity of the current. If the magnet employed in this ex-
experiment be one of soft iron and suddenly excited by a galvanic current, the copper disk previously put in rapid motion will instantly be stopped. The current in the radii of the plate which are approaching the magnetic pole, being in an opposite direction to those in the magnet, will be repelled; while those in the radii on the other side of the pole, being in the same direction with the current in the magnet, will be attracted; and hence the resultant action of all the induced currents will be to stop the plate. A similar result is produced when a cube of copper of about an inch in diameter is suspended between the poles of a powerful electro-magnet, and caused rapidly to revolve, from the untwisting of a thread by which it is suspended; when the magnet is suddenly excited, the revolution of the cube is instantaneously arrested, and brought to rest without the least oscillation, as if the momentum and consequently the inertia of the mass were instantly annihilated. If, in the case of the arrangement of the revolving disk we have mentioned, a rapid motion be communicated to it by a train of wheels in opposition to the resistance between the induced currents and the magnet, a considerable exertion will be required to continue the motion; and since, according to the principle of the conservation of force, the muscular power expended must produce some effect, and no change is found in the condition of the metal after the experiment, the conclusion was drawn that the energy exerted was expended in generating heat, the truth of which was established by Foucault. The disk thus made to revolve in opposition to the force of the magnet increases in temperature, and soon becomes sufficiently hot to set fire to an ordinary match.—*The Magnetism induced from the Earth and the Sun.* The earth being a great magnet, currents of electricity must be induced in all conducting material in which motion takes place at its surface. These currents are, however, of feeble intensity, but their existence may be shown by connecting the ends of a copper wire several hundred yards in length, covered with silk and wound around a wooden cylinder of about 2 ft. in length, with a galvanometer, and by suddenly turning the axis of the former in a horizontal position into the direction of the slipping needle. During the downward motion of the N. end of the cylinder, the galvanometer will indicate an induced current in an opposite direction to that of the hypothetical current of the earth, and, when the motion is reversed, an induced current in the same direction as that of the current in the earth. From this result it must be inferred that electrical currents are constantly produced by the magnetism of the earth, since no change in the direction and position of a conducting body can take place without developing the inductive action. Moreover, since the sun has been proved to be a great magnet, exerting a powerful action on the earth, the daily rotation of the latter must subject it to an inductive action, similar to that we have described in the revolving plate of copper. There can be no doubt, in the present state of science, that such currents actually do take place, but their direction and intensity have not yet been ascertained. But from the association of the magnetic storms we have previously described with the occurrence of the aurora borealis, and also with that of the maximum number of spots on the sun, we are led to the conclusion that the three classes of phenomena are intimately connected, and that they furnish a subject of cosmical research of perhaps as great interest as any which have ever occupied the attention of the scientific world.

**Magnetizing Glass.** See Microscope.

**Magnin, Charles,** a French author, born in Paris, Nov. 4, 1793, died there, Oct. 7, 1862. He received a brilliant education, and became in 1813 assistant in the imperial library, and in 1832 one of the directors of that institution. His theatrical criticisms in the *Globe* (1826–30), his lectures at the Sorbonne (1834–5) on the origin of the modern stage, and his various writings won for him the praise of Sainte-Beuve, and a seat in the academy of belles-lettres. He also wrote poetry and plays. His principal works are: *Origines du théâtre moderne* (1838); *Causeries et méditations* (2 vols., 1843); *Théâtre de Héroïsmi* (1845, with text and translation); and *Histoire des marionettes* (1852).

**Magnolia,** a genus of trees and shrubs dedicated by Linnaeus to Pierre Magnol, professor of botany at Montpellier, France, at the close of the 17th century, and who was the first to apply the term "family" to designate groups of botanical genera. The genus is the type of the Magnoliaceae, a family as to the limits of which botanists are not agreed, as accepted by Bentham and Hooker (*Genera Plantarum*), it includes nine genera, four of which, *Magnolia, tilirodendron, ilicium,* and *schizandra,* are represented within the United States. In Magnolia there are fourteen species, six of which belong to Japan, China, and the Himalayas, and the remainder to North America, including Mexico. While a few are low shrubs, the majority are fine trees, some reaching the height of 50, 60, and even 100 ft.; there are both evergreen and deciduous species, and nearly all are ornamental by reason of their fine foliage and flowers. The leaves are alternate, sometimes so crowded upon the stem as to appear whorled, entire, furnished with stout petioles, which when they fall leave broad scars upon the stems; the leaves proceed from cylindrical, acute buds, the integuments or protecting bud scales of which consist of the large deciduous stipules, which are adherent to the base of the petioles; the stipule of each leaf envelops the succeeding leaf next above it, which is folded lengthwise and rests against the next stipular sheath, and so on; the stipules fall away as the leaves unfold. The flowers, usually large, are solitary and terminal, and are white, greenish yellow, or purple; they
MAGNOLIA

have three petal-like sepalis, which fall early, and six to twelve petals in two to four series; the numerous stamens are in many series upon the base of the receptacle, which is prolonged into the centre of the flower; the anthers are linear, longer than the filaments, and open inward; the pistils are numerous, consisting of a one-celled, two-ovuled ovary, pointed with a short style; they are densely crowded upon the upper part of the receptacle; in maturing, the ovaries become red, fleshy, and coalesce to form a compound cone-like fruit; when ripe each carpel (ovary) opens and liberates the two seeds, which have a fleshy bright red coat, and are for a while suspended by extensile cobwebby threads, which the microscope shows to be uncoiled spiral vessels. Bitter and somewhat aromatic properties pervade the genus, and the flowers of some species are highly fragrant.—Our most widely distributed species is the small or laurel magnolia, or sweet bay (M. glauca), growing in swamps from Cape Ann, Mass., to Florida, usually not far inland; in its northern localities it is only a shrub or low tree with numerous stems from the same root, and is deciduous; but in some of the southern states it grows 50 ft. or more high and becomes an evergreen. The bark of the young shoots is green, and the oblong leaves are dark green above and pale or glaucous beneath; the globular white flowers are about 2 in. across and delightfully fragrant. The fruit is 2 in. long. The bark of the root, the cones, and the seeds, made into a tincture with spirits, are popularly used in some parts of the country as a remedy in rheumatism, and have also been successful in diseases of a typhoid character in the hands of physicians. In the southern states, where the tree grows sufficiently large, the wood has been used for finishing the interiors of houses, for furniture, and similar work; it is of a mahogany color and takes a good polish. The terminal shoots, bearing a flower and a cluster of leaves, are sold in large numbers in the streets of New York and other cities. Like many other plants which grow naturally in swamps, the small magnolia flourishes when transferred to the drier soil of the garden, and may be trained to form a perfectly symmetrical little tree. It is surprising that a native plant of such great merit should be so seldom seen in cultivation; there is a popular impression that it is difficult to manage, which is no doubt due to the fact that large numbers of plants, pulled up rudely from the swamp, are each year sold in cities by itinerant vendors; such plants when set out are sure to die. All of the magnolias are difficult to transplant from their native localities, but trees raised from the seed in nurseries, and several times transplanted, are quite sure to succeed. The manner of propagating the species in general will be found below. This species blooms when only 4 or 5 ft. high; it has produced several garden forms, which differ from the original in the size and shape of their leaves; one of these, Thompson's magnolia (M. Thompsoniana), is said to be a hybrid between M. glauca and some other, but it is apparently only a large-leaved variety; it is valuable on account of its fine foliage and long continued bloom. The next northernmost species, known as the cucumber tree (M. acuminata), is found from western New York westward to Illinois and southward to Georgia, and with one exception is the largest of all our magnolias, reaching from 60 to 90 ft.; it grows rapidly, assumes a fine shape, and its abundant foliage renders it valuable as an ornamental or shade tree; the leaves are thin, 5 to 10 in. long, oblong, pointed, and slightly downy beneath. In this species the flowers add nothing to the beauty of the tree; they are bell-shaped, about 8 in. broad, and consist of twisted or straggling glaucous green petals which are tinged with yellow; the fruit, which is about 3 in. long, resembles when young a small cucumber; the wood is like that of the tulip tree, but is less valuable, and with builders ranks in usefulness with that of the linden; it is somewhat used for the inside work of houses; in the western states it is valued above all other woods for making pumps and for pipes for conveying water. The great-leaved magnolia (M. macrophylla) is a still more southern species, S. E. Kentucky being its northernmost locality, whence it extends to Georgia and Florida, but is rare everywhere; it grows to the height of 30 or 40 ft., its trunk and branches clothed with a white bark. This species is the most remarkable in the genus for the size of its leaves and flowers; the ovate-oblong leaves are narrow and heart-shaped at the base and from 2 to 3½ ft. long; the petals are 6 in. long, and the open, bell-shaped flower 8 or 10 in. across, pure white, with a purple spot at the base of each petal, and somewhat fragrant; fruit ovate. It is quite hardy in New York and in some parts of New England, and is worthy of being
planted wherever it will endure the climate. The umbrella tree (M. umbrella), also a large-leaved species, has York and Lancaster counties, Pa., for its northern limit, and is found in most of the southern states; it rarely exceeds 30 ft. in height; the leaves are pointed at both ends and from 1 to 3 ft. long; as they are crowded in a circle at the ends of the irregular branches, the tree presents the appearance expressed in its common as well as its specific name; the flowers are 6 to 8 in. broad, pure white, and have a sweet, heavy odor, which is disagreeable to most persons; its large, rose-colored cones are 4 to 5 in. long and showy. Being a rather straggling tree, it can hardly be considered as very ornamental, although it is an interesting species; it is hardly near Boston; it was formerly called M. tripetala. The ear-leaved umbrella tree (M. Fraseri, and formerly M. auriculata) occurs in Virginia, Kentucky, and southward along the mountains; it grows 40 to 50 ft. high, and though it has some resemblance to the preceding, it is handsomer in all respects; its oblong-obovate or spatulate leaves are auricled or have an ear-lobe-like appendage on each side at the base; they are seldom over a foot long, and are crowded at the ends of the branches in an umbrella-like cluster; the flower is about 6 in. across, white and pleasantly fragrant. The only other deciduous native species is the yellow cucumber tree (M. cordata), a native of North Carolina and Georgia; it grows 40 or 50 ft. high, and has oval or roundish leaves, sometimes slightly heart-shaped at base, about 6 in. long; the flowers are 4 to 5 in. wide and of a lemon-yellow color, which contrasts finely with the rich green of the foliage; though a peculiarly southern species, this has proved hardy in New England.—Our only perfectly evergreen species is the great-flowered magnolia (M. grandiflora), also called the great laurel magnolia, which grows from North Carolina to Florida and westward to Louisiana. Probably no other American tree has had so much written in its praise as this, and it is deserving of all the encomiums that have been bestowed upon it; for whether we regard it as a forest tree or as a garden ornament, it is unsurpassed for nobleness and beauty. It reaches its greatest perfection in light fertile soils, and those who have only seen the few poor stunted specimens that linger along on its northern limits can have no idea of the beauty of well developed specimens. It grows to the height of 60 to 100 ft., and when not crowded by other trees assumes a form as regularly pyramidal as if it had been shaped by art; its oblong or obovate leaves are very thick and leathery, of the darkest shining green above and rusty-colored beneath, from 6 to 12 in. long; the flowers, 6 to 9 in. across, are of the purest white and delicately fragrant; they are produced during April and May, and after they are gone the red cones show with fine effect against the dark-green foliage. The flowers turn brown in fading, and the slightest injury to the petals shows itself as a brown spot; if the petals of this or any others of the white-flowered magnolias be written upon with a sharp point, the

writing will soon become legible in distinct, dark-brown characters. In some situations in England this tree endures without protection, but generally it needs the shelter of a wood or buildings; in this country Philadelphia seems to be its northern limit, and there its flowering is of rare occurrence; in more northern localities it must be regarded as a greenhouse plant; in those states where it will not only live but thrive, it is deservedly popular, whether planted as single specimens or to line an avenue. A number of well marked varieties have been raised from seeds, differing from the type in form of the leaves, size of the flowers, and other particulars; one of these raised in Georgia is an almost continuous bloomer.—Several of the exotic species are common in cultivation, while others, at the north at least, are only greenhouse plants; some botanists have placed these in separate genera, but they are proper magnolias. The best known of these is the yulan (M. conspicua), a Chinese name signifying lily tree, which is often met with as a shrub flowering when only 3 or 4 ft. high, but which grows to a handsome tree of 30 to 50 ft.; the flowers, which appear in early
spring (April), before the leaves, are large, white, and fragrant; the leaves are ovate, pointed, and downy when young; the fruit, by the suppression of some of the carpels, is often contorted into most grotesque shapes. This tree is quite hardy in a much colder climate than that of New York, and for its large, early, fragrant flowers is a favorite with many, while others object to it on account of its naked appearance when in flower; there is a celebrated specimen near Newburgh, over 90 ft. high, symmetrical in form, and when in bloom its flowers are estimated by thousands. It is a great favorite with the Chinese, who dwarf it, as they do other trees, by cramping the roots in small pots. A row of seedlings of this magnolia presents a great variety in foliage, and some of these are retained in cultivation under distinct names. The purple magnolia (M. purpurea) is a native of Japan; in cultivation it seldom reaches above 10 ft.; it has the same habit of early flowering with the preceding species; the large flowers are pinkish purple outside and white within; the leaves are of a bright dark green; it is somewhat less hardy than the preceding, and in cold localities is treated as a greenhouse plant. Soulange’s magnolia (M. Soulangeana of the nurseries) is a hybrid between the two just noticed; the tree has the habit and hardness of M. conspicua, while the purple tinged in the petals shows its relationship to M. purpurea. Lenné’s magnolia, of comparatively recent introduction, is supposed to be a variety of M. purpurea, from which it differs in its finer foliage and larger and more deeply colored flowers. Several other species or varieties of this group are in cultivation, but their value remains to be ascertained. There are a few other exotic species, but they are rare in our gardens. Campbell’s magnolia (M. Campbelli), of the Sikkim Himalayas, is described as a large tree with fine foliage, and crimson and white flowers rivalling those of M. grandiflora in size and exceeding them in beauty. M. Kobus and M. obovata are Japanese species grown in greenhouses. M. fuscata is a small evergreen shrub with much the appearance of a camellia; its brown stems are hairy, and its flowers, which are brownish red or purple, are exceedingly fragrant; the French call it the black-wooded magnolia on account of the dark color of its wood. This species grows in the open air in Georgia and other southern states, where it is highly prized for its fragrance, and is generally known as the banana shrub; it there forms a dense bush 8 or 10 ft. high.—The magnolias are readily raised from seeds, which germinate better if sown as soon as ripe; if they are to be kept till spring, they must be preserved in slightly damp sand, for if allowed to become perfectly dry they will not germinate. The difficulty of removing wild trees has already been alluded to; they form but few fibrous roots, and hence are usually looked upon by nurserymen as plants very difficult to handle; but if nursery-grown plants are frequently transplanted during their growth, fibrous roots are formed, and they can be removed with safety; in some nurseries the trees are grown in pots, and these, though necessarily small, are quite safe for the planter to purchase, as they may be turned into the open ground without disturbing their roots. Magnolias are also multiplied by layers, but the tall-growing ones thus treated never produce handsome-shaped trees, and those from seed are preferable. The rarer kinds, especially the Chinese, are grafted upon some species which grows readily from seed, the cucumber tree (M. acuminata) being usually selected as the stock upon which to graft. Inarching is also sometimes resorted to to multiply these plants. (See Grafting.)

MAGNUS, Eduard, a German painter, born in Berlin, Jan. 7, 1799, died there, Aug. 9, 1872. He studied in Berlin and in Rome, and became known as a member and professor of the Berlin academy and as a portrait painter. He published "Über Einrichtung und Beleuchtung von Räumen zur Aufstellung von Gemälden und Skulpturen" (Berlin, 1864), and "Die Polychronie vom künstlerischen Standpunkte" (Bonn, 1872).

MAGNUS, Heinrich Gustav, a German chemist, born in Berlin, May 2, 1802, died there, April 4, 1870. He graduated at the university of Berlin in 1827, where he became in 1884 extraordinary, and in 1845 ordinary professor of physics and technology. In 1828 he discovered the compound formed of the elements of chloro-ride of platinum and of ammonia, the first of a series of combinations of the same substances, and known as the green salt of Magnus. He afterward published "Reiseforschungen in Capil- larity" and observations upon evaporation in capillary tubes. Almost simultaneously Mag- nus and Regnault made public the results of their experiments upon the coefficient of the dilatation of gases, the former in Nov. 25, 1841, and the latter on Dec. 18, 1841. In 1860–61 Magnus published his experiments on the transmission of heat through gases in the double aspect of conductibility and radiation, which led to a protracted controversy with Tyndall. His last publication was a memoir on the emission, absorption, and reflection of heat by bodies at low temperatures. His les- tures continued till near the close of his life, and for their illustration he formed the physical cabinet of the university.

MAGNUSSON, or Magnusen, Finn, an Icelandic scholar, born in Skalholt, Aug. 27, 1781, died in Copenhagen, Dec. 24, 1847. He studied at the university of Copenhagen, returned to Iceland in 1803, and practised as an advocate. In 1812 he went again to Copenhagen, where in 1815 he was appointed professor, and in 1819 began to lecture in the university and the academy of fine arts on the old Norse literature and mythology. In 1842 he was made keeper of the archives. He was the author of many ar- chaeological works, of which the most impor- tant are: "Bidrag til nordisk Arkeologie" (Co-
penhagen, 1829), in which he maintained the plastic symbolic ideality of the Norse myths, which makes them as appropriate as those of the Greeks for artistic representation; 

Price Peterum Borralium Mythologiae Lexicon et Gentile Calendarium (1824); a translation and explanation of the elder Edda, *Ældre Edda*, oeverst og forklaaret (4 vols., 1821-3); and 

Eddalœren og dens Oprimlelse (4 vols., 1824-

6), an exposition of the whole doctrine of the Edda from the standpoint of comparative mythology. In connection with Raff he pro-

duced *Grønlnds historiske Minnesmerker* (3 vols., 1838-42), and *Antiquités russes* (2 vols., 1850-52). He also wrote a work on runes, 

Rønna og Runerne (1841).

**MAGOFFIN**, an E. county of Kentucky, wa-
tered by Licking river; area, about 600 sq. 
m.; pop. in 1870, 4,654, of whom 179 were 
colored. The surface is hilly and the soil 
moderately fertile. The chief productions in 
1870 were 5,971 bushels of wheat, 174,591 of 
Indian corn, 17,488 of oats, 10,600 of pota-
toes, 13,774 lbs. of wool, and 43,537 of butter. 
There were 1,065 horses, 1,532 milk cows, 
2,908 other cattle, 6,130 sheep, and 5,945 
swine. Capital, Salyersville.

**MAGOON, Elissa L.**, an American clergyman, 
born at Lebanon, N. H., Oct. 20, 1818. He 
was the son of an architect who was impov-
erished by sickness, and obtained a good edu-
cation by his earnings as a bricklayer. He 
was ordained in 1840, and immediately settled 
at Richmond, Va., as pastor of the second 
Baptist church, where he remained six years, 
and then made the tour of Europe. On his 
return he became pastor of a church in Cin-
cinnati. Here he remained till 1849, when he 
became pastor of the Oliver street Baptist 
church, New York. In 1857 he was called to 
the pastorate in Albany, and about 1860 re-
moved to Philadelphia, where he now resides 
(1874). He formed a valuable collection of 
pictures, especially in water colors, which he 
sold to Vassar college, Poughkeepsie. In 1853 
Rochester university conferred upon him the 
degree of D. D. His published works are: 

"Orators of the American Revolution" (New 
York, 1848); 

"Living Orators in America" 
(New York, 1849); 

"Proverbs for the Peo-
ple" (Boston, 1848); 

"Republican Chris-
tianity" (Boston, 1849); and 

"Westward Eu-

tire" (New York, 1856).

**MAGOT.** See MACAQUE.

**MAGPIE**, a onirostral bird of the crow 
family, and the genus *Pica* (Briss.). The bill is 
long and strong, about as high as broad at the 
base, with compressed sides, hooked tip, and 
covered with glossy feathers nearly to its mid-
dle; wings long and pointed, with the first 
quill short, falcate, and attenuated, and the 
fourth and fifth nearly equal and longest; 
the tail is very long and graduated, the lat-
eral feathers scarcely more than half the mid-
dle; tarsi longer than the middle toe, strong 
and covered with broad scales in front; toes 
strong, and the hind one long, with curved 
sharp claws; a naked patch behind and below 
the eye; head without crest; nostrils circular. 
Nearly a dozen species are described, inhab-
iting the old world and North America; they 
are seen generally in pairs, but sometimes in 
flocks, noisy and restless; they will eat vege-
tables, grains, mollusks, worms, insects, and 
even carrion, and destroy eggs and young 
birds. The nest is made upon high trees or in 
thick bushes, of large size, of coarse materials 
plastered with clay, and softly lined with wool, 
hair, and feathers; there is generally a kind of 
roof over the nest, with a narrow entrance for 
the birds. The common magpie of Europe 
(*P. melanocephala, Vieill.*) is 18 in. long, with 
an extent of wings of 2 ft., the tail 10 in., 
and bill 1½ in.; the plumage of the head, 
neck, back, anterior part of breast, and abdo-
men black; the rest of the breast and the outer 
scapulars white; the tail and wings splen-
dent with green and purple, most of the inner 
web of the outer quills white; iris dark. This 
elegantly formed and handsome bird is gen-
erally distributed in the wooded districts of 
Europe; in form it approaches nearest to the 
jackdaw, but the wings are shorter and the 
tail much longer. It is fond of coming near 
human habitations; the flight is rather heavy, 
but moderately rapid; the notes are almost 
incessant and hard; the tail is elevated while 
walking. The eggs are from three to six, about 
1½ by 1 in., of a pale green with brown and 
purplish freckles, or pale blue with smaller 
spots resembling those of the jay; it is fond of 
building in the same locality, and frequently in 
the same nest. From its docility it is an agree-
able pet, though it has the propensity common 
to the crow family of stealing whatever objects,
MAHAN, Asa, an American clergyman, born in Vernon, N. Y., in 1799. He graduated at Hamilton college in 1824, and at Andover theological seminary in 1827, and was ordained pastor of the Presbyterian church in Pittsford, N. Y., Nov. 10, 1829. He was pastor of the Sixth street Presbyterian (now the first Congregational) church, Cincinnati, from its organization in 1831 till 1835, when he became president of Oberlin college, and professor of intellectual and moral philosophy and assistant professor of theology. In 1850 he was chosen president of the Cleveland university, in 1856 became pastor of the Congregational church in Jackson, Mich., and in 1858 of the Congregational church in Adrian, Mich., and in 1861 president of Adrian college, which post he resigned in 1871, continuing to reside in Adrian. He has been a distinguished advocate of the religious views known as Perfectionist, and has published a work entitled "Christian Perfection." His other works are: "The Science of Intellectual Philosophy" (New York, 1845); "The Doctrine of the Will" (1846); "The True Believer" (1847); "Modern Mysteries Explained and Refuted," relating to spiritualist manifestations (Boston, 1855); "The Science of Moral Philosophy" (Oberlin, 1856); and "The Science of Logic" (New York, 1857). He has of late been engaged upon a work entitled "A Critical History of Philosophy."

MAHAN, J. Dennis Hart, an American military engineer, born in New York, April 2, 1802, drowned in the Hudson river, near Stony Point, Sept. 16, 1871. He graduated at West Point in 1824, was appointed second lieutenant in the corps of engineers, and was made assistant professor of mathematics in the military academy. In 1825 he became assistant professor of engineering, and in 1829 was sent by the war department to study in Europe, where he remained four years. In 1832 he was appointed professor of military engineering, which post he held till his death. He received the degree of LL. D. from William and Mary and Dartmouth colleges and Brown university. His death was by suicide, during a temporary insanity resulting from his distress on learning that the board of visitors had recommended that he should be put on the retired list. He published "Treatise on Field Fortifications" (1866); "Elementary Course of Civil Engineering" (1857; rewritten, 1868); "Elementary Treatise on Advanced Guard, Outpost, and Detachment Service of Troops" (1847); "Elementary Treatise on Industrial Drawing" (1853); "Descriptive Geometry, as applied to the Drawing of Fortification and Stereotomy" (1864); and "Military Engineering: Part I, Field Fortifications, Military Mining, and Siege Operations" (1865); and "Part II, Permanent Fortifications" (1867). He edited, with additions, an American reprint of Moseley's "Mechanical Principles of Engineering and Architecture" (1856). He, like his brother, was an American clergyman, brother of the preceding, born at Suffolk, Nansomond co., Va., May 24, 1819, died in Baltimore, Sept. 3, 1870. He was educated at St. Paul's college, Flushing, L. I., took orders in the Protestant Episcopal church in 1845, became rector of Grace church, Jersey City, in 1848, and two years later assistant minister in St. Mark's church, Philadelphia. He was elected professor of ecclesiastical history in the general theological seminary of the Episcopal church in 1851, a post which he
MAHANOY CITY

held for 19 years. In July, 1864, he became rector of St. Paul's church, Baltimore. Dr. Mahan published "The Exercise of Faith" (1851); "History of the Church, first Three Centuries" (1860; new ed., first seven centuries, 1872); "Reply to Colenso" (1863); "Palmoni, a Free Inquiry" (1863); and "Comedy of Canonization" (1868). His works have been collected, with a memoir by the Rev. J. H. Hopkins, Jr. (3 vols., New York, 1872-5).

MAHANOY CITY, a borough of Schuylkill co., Pennsylvania, 80 m. N.W. of Philadelphia and 56 m. N.E. of Harrisburg; pop. in 1870, 5,533; in 1874, including suburbs, about 10,000. It is in the Mahanoy valley, 1,211 ft. above the sea, near the watershed between the Delaware and Susquehanna, in the midst of a rich anthracite region. It has railroad communication with Philadelphia, Harrisburg, and New York, by means of the Lehigh Valley and Philadelphia and Reading lines. It is supported by the neighboring mining district, which disburses $900,000 in wages monthly. It has a large foundry, a national and a state bank, two insurance companies, two public halls, three large school houses, a public library, two weekly newspapers, and 13 churches. The first houses were erected in 1859.

MAHANUDDY, a river of India, rising about lat. 21° N., lon. 81° E. It flows N.E., S.E., and E., through the provinces of Berar and Orissa, and falls into the bay of Bengal through numerous deltaic arms which divide just below Cuttack, where during the rainy season it is 2 m. broad; its principal mouth is in lat. 20° 18', lon. 86° 40'. It is about 480 m. long, and is navigable during the rains 300 m.; but during five or six months of the year a large part of its channel is dry, and it is fordable even at Cuttack. Diamonds of the finest quality are found in it and in its tributaries.

MAHASKA, a S.E. county of Iowa, intersected by the Des Moines and the N. and S. forks of Skunk river; area, 570 sq. m.; pop. in 1870, 22,508. The surface consists in great part of level or undulating prairies, diversified with woodlands, and the soil is productive. Coal and limestone abound. The Des Moines Valley railroad and the Central railroad of Iowa pass through it. The chief productions in 1870 were 334,752 bushels of wheat, 1,861,282 of Indian corn, 197,109 of oats, 127,145 of potatoes, 138,512 lbs. of wool, 382,492 of butter, and 28,172 tons of hay. There were 8,924 horses, 1,579 oxen, 11,302 other cattle, 31,652 sheep, and 33,591 swine; 7 manufactories of carriages and wagons, 2 of marble and stone work, 2 of sash, doors, and blinds, 4 woolen mills, 9 flour mills, and 4 saw mills. Capital, Oskaloosa.

MAIMOUD I., sultan of Turkey, a son of Mustapha II., born in Constantinople, Aug. 6, 1636, died Dec. 13, 1754. He was raised to the Ottoman throne in 1739, after the deposition of his uncle Ahmed III. The janizaries, who had revolted against the latter and made Mahmoud sultan, exacted from him a promise to continue the war against Nadir Shah of Persia. His military operations, however, were disadvantageous, and he finally concluded a peace in 1739. In the mean while the Russians had begun hostilities, and in 1737 they took Otechakov and Kinburn, while their Austrian allies invaded Wallachia. The latter were however defeated by the Turks at Krotzka on the Danube in 1739, upon which the court of Vienna made peace on disadvantageous terms, relinquishing not only what its forces had recently taken, but also Belgrade, captured during a former war. The Russians obtained a more favorable treaty, retaining all their conquests. In 1748 hostilities again broke out between Persia and Turkey, and were closed by a treaty unfavorable to the latter. Notwithstanding the wars in which his army was engaged, Mahmoud was a man of peaceful disposition, and Turkey was comparatively well governed under him. He was succeeded by his brother Osman III.

MAIMOUD II., sultan of Turkey, the younger son of Abdul Hamed, born in Constantinople, July 20, 1785, died there, July 1, 1839. During his youth, passed in the seraglio, he became familiar with Persian and Turkish literature, and is said to have manifested at an early age a character of great firmness not unmingled with cruelty. His elder brother Mustapha IV., who ascended the throne in 1807, had ordered him to be put to death as a possible rival, when Ramir Effendi, paymaster of the army, rescued him. Bairakar, the pasha of Rustchuk, raised an insurrection, deposed Mustapha, and placed Mahmoud on the throne, July 28, 1808. Bairakar became great vizier, and with the sultan boldly attempted to carry out those European military reforms for promoting which Selim III., the predecessor of Mustapha, had been deposed. The janizaries, whose organization was threatened by this, rose in rebellion, and stormed the seraglio. Bairakar blew himself up with his enemies, and Mahmoud as a desperate measure ordered Mustapha IV. and his infant son to be strangled, and his four pregnant sultanas to be sewn in sacks and thrown into the Bosporus. After a long struggle amid pillage and confabulations, the rebels gained a victory, and the sultan was obliged to submit to their demands. As he was however the only living descendant of Osman, they recognized him as their ruler, dreading the anarchy which must ensue should the royal family become extinct. He now, under very unfavorable circumstances, and without resources, continued the war with Russia and the Servians, until, when totally exhausted, his divan concluded a treaty with the Russians at Bucharest, May 28, 1812, by which the Pruth became the boundary of the two empires, the Servians receiving the promise of an amnesty. From this time the daring and despotic character of Mahmoud manifested itself with striking effect, both in reforms at home and in wars
abroad. The Wahabees of Arabia were subdued by Ibrahim Pasha, the son of the viceroy of Egypt, Mehemet Ali. Dreading the increasing power of Ali Pasha of Janina, Mahmoud made war on him and crushed him in 1822. In 1821 his Greek subjects revolted. By the aid of Mehemet Ali he carried on a successful war against them, but with such extreme cruelty that France, Russia, and Great Britain-monstrated. Their mediation being disregarded by Mahmoud, they attacked and destroyed his fleet at Navarino, Oct. 20, 1827. In 1829, after a desperate struggle, in which he displayed great courage and ability, he had overthrown the janizaries, and organized an army on European principles. With full confidence in its power, he did not shrink from a war against Russia, but was defeated, Diebitsch even crossing the Balkan; and in consequence of the mediation of England, France, and Prussia, he signed the treaty of Adrianople, Sept. 14, 1829. In 1832, Mehemet Ali having refused to withdraw his troops from Syria, which he had occupied, Mahmoud made energetic preparations against him, but was defeated by Ibrahim Pasha at Hems and Konieh, and was only saved by Russian intervention from being dethroned. The result was an alliance for mutual defence between Turkey and Russia. In the mean time Mahmoud had done much to improve the domestic condition of his kingdom. Roads were made, postal communication was established, ambassadors were appointed to the European courts, and women were allowed to appear in public; measures which did not fail to make him many enemies among the conservative party. Justice was speedily and severely administered, and an energetic though unscrupulous police, often aided by the sultan himself, disguised, did much to establish order. But his oppression of all the higher officers of his kingdom, and the frequency with which he plundered, displaced, or slew them, sacrificing men of ability to unworthy favorites, deprived him of trustworthy aid, and his reign was a succession of revolts and disgraceful attempts. In 1839, being still determined to reduce Mehemet Ali, he drove him into a new rebellion. His army was again defeated by Ibrahim at Nizib, but he died before the news reached him. He was succeeded by his son, Abdul Medjid.

**MAHMOUD**, sultan of Ghuzni. See Ghuzni.

**MAHOGANY** (Swietenia mahogani), a tree of the natural order Meliaceae, a native of South America, Honduras, and the West India islands, and among the most valuable of tropical timber trees. The genus is named in honor of Baron Gerard van Swieten. The mahogany is a large, spreading tree, with pinnate shining leaves. The trunk often exceeds 50 ft. in height and 4 or 5 ft. in diameter. The flowers, in axillary panicles 3 or 4 in. long, are small and greenish yellow, and are succeeded by fruit or capsules of an oval form and the size of a turkey's egg. Though the growth is very rapid, the wood is hard, heavy, and close-grained, of a dark, rich, brownish red color. The so-called Spanish mahogany, which includes all the above, except that from Honduras, is imported in logs about 10 ft. long and 2 ft. square. The Honduras mahogany is usually larger, the logs being from 12 to 18 ft. long, and from 2 to 3 ft. square. It is chiefly obtained upon low moist land, and is generally soft and coarse. The trees which grow on rocky elevated grounds are of smaller size, but the wood is harder and more beautifully veined. The collection of mahogany for commerce is a most laborious business, often involving the construction of a road through a dense forest and in a most difficult country, upon which the wood may be drawn to the nearest water-course; the logs are roughly squared to prevent them from rolling off of the low rude trucks upon which they are drawn. The natives make this wood serve many useful purposes, as canoes and handles for tools. Some have supposed the Honduras to be a different species from the Spanish, from its being lighter in color, as well as porous in texture; but it is now ascertained that these differences arise from the different situations in which the trees are found. The largest log ever cut in Honduras was 17 ft. long, 57 in. broad, and 64 in. deep, measuring 5,421 ft. of inch plank, and weighing upward of 15 tons. The mahogany brought from Africa and the East is decidedly inferior to either of the above; but a fine specimen sent from Calcutta to the London exhibition of 1851 proves that the best quality may be raised in the East Indies. The Spanish mahogany is one of the most useful of all woods for household furniture, for which it is adapted especially by its durability, beauty, hardness, and susceptibility of polish, though of late years it has been less fashionable than some other woods. The finer kinds of furniture are of solid mahogany, but
the greater part of that in use is made of cheaper woods covered with a thin veneer of mahogany. Alkalies are often applied to the lighter colored wood in order to deepen the shade, but the best effect is produced by using a colorless varnish, which brings out in fresh beauty the rich veins, and leaves its natural tints unchanged. The grain, or curl as it is called, is sometimes so beautiful, that it increases the value of the log to an enormous price; several logs have been sold for over $5,000 each; in one instance three logs, each 15 ft. long and 38 in. square, produced from a single tree, brought $15,000. It is usually a difficult matter for dealers to judge with precision of the worth of the wood in logs by inspection of the exterior. Mahogany is said to have been employed about the year 1595 in repairing some of Sir Walter Raleigh’s ships, but it was not used for cabinet work till 1720, when a few planks from the West Indies were given to Dr. Gibbons of London. A man named Wollaston, employed to make some articles from this wood, discovered its rare qualities, and it was soon in high repute.—See Hooker’s “Botanical Miscellany,” vol. i. (London, 1830).

MAHOMET. See Mohammed.

MAHON, Lord. See Port Mahon.

MAHONING, a N. E. county of Ohio, bordering on Pennsylvania, drained by the Mahoning and Little Beaver rivers; area, 422 sq. m.; pop. in 1870, 31,901. It has an undulating surface and a highly productive soil. Coal and iron ore are found. It is traversed by the Atlantic and Great Western and the Pittsburgh, Fort Wayne, and Chicago railroads. The chief productions in 1870 were 175,907 bushels of wheat, 361,439 of Indian corn, 449,385 of oats, 124,758 of potatoes, 31,000 of flax seed, 2,684,531 lbs. of flax, 91,757 of maple sugar, 295,467 of wool, 963,557 of butter, and 45,371 tons of hay. There were 7,312 horses, 18,582 cattle, 65,053 sheep, and 8,667 swine; 3 manufactories of machinery, 3 of woolen goods, 2 of bolts and nuts, 1 of nails and spikes, 7 iron furnaces, 4 foundries, 2 rolling mills, 12 tannings and currying establishments, 5 flour mills, and 27 saw mills. Capital, Canfield.

MAHONY, Francis, an Irish journalist, born in Cork about 1805, died in Paris, May 19, 1866. He studied at a Jesuit college in Paris, and subsequently in Rome, where he remained for seven years, and took orders. He afterward abandoned the clerical profession, and joined the staff of “Fraser’s Magazine,” his contributions to which were published in book form, under the title of “Reliques of Father Prout,” in 1836, and republished, with etchings by Macise, in 1860. He was also one of the earliest and most popular contributors to “Bentley’s Miscellany” in 1837. After travelling through Hungary, Greece, Egypt, and Asia Minor, he originated the Roman correspondence of the London “Daily News,” in which he powerfully advocated the cause of Italy. His letters were collected under the title “Facts and Figures from Italy, by Don Jeremy Savonarola, Benedictine Monk” (London, 1849). He was also for many years Paris correspondent of the London “Globe.” In 1864 he retired to a monastery in Paris, where he passed the rest of his life. The “Final Reliques of Father Prout” was edited by Blanchard Jerrold (London, 1874).

MAHRATTAS (Maha-roshtra, great people), a people inhabiting the region in central and western India bounded N. by the Satpooa mountains, E. by the Wyne-Ganga and Manjera rivers, S. by the Kistnah and Malpuda, and W. by the Indian ocean. They eventually spread themselves across the whole peninsula, through the dominions of Holkar, Sindia (Gwalior), and the guicowar, and the country of Nagpore, where they still form an important element in the population. Some writers, however, regard them as foreigners who emigrated there about the 7th century, and Pickering assigns them an Arabian or Egyptian origin. They are of llindoos race, and are hardy, active, and well proportioned, but very ill-favored; their stature is small, their skin is dark, and their features are irregular. They are much given to athletic exercises, and are excellent horsemen, but turbulent and predatory, and unfit for regular military service. They are cruel and perfidious, and have exercised a disastrous influence upon the countries they have conquered. They are devout Brahmins. They first become conspicuous in history about the middle of the 17th century, when they possessed a narrow tract of territory bordering on the Arabian sea and extending nearly from Goa to Guzerat. Sevajee (born in 1627, died in 1680), the son of an officer in the service of the last Mohammedan king of Bijapoor, was the founder of the Mahratta empire. Having collected an army among the mountains, he overthrew the kingdom of Bijapoor, and gradually united under his own rule the multitude of petty states among which the Mahrattas were divided. His son Sambajee extended his conquests, but was finally put to death by Aurungzebe in 1689. Under Saho, grandson of Sevajee, the hereditary prime minister or peishwa became the actual ruler of the Mahrattas, and maintained their supremacy against the repeated assaults of Nizam ul-Mulk, the representative of the Mogul emperor in the Deccan. At the culmination of their power, in the middle of the 18th century, the peishwa, with his capital at Poonah, was the recognized head of the confederacy of great chiefs who ruled the several Mahratta states. Guzerat, where subsequently arose the independent power of the guicowar, and a great part of Malwa, were overrun by the Mahrattas, and about 1760 they made themselves masters of Delhi. Defeated however by Ahmed Khan of Afghanistan in the great battle of Paniput (1761), their downfall began; and though they again occupied Delhi (1772), they
lost valuable possessions to the armies of Tippoo Sahib, and were driven from the Moham-
dedian metropolis by the British in 1808. A few years later two other Mahratta chiefs, Hol-
kar and Sindia, who ruled the independent states of Indore and Gwalior, founded some 70 years before, entered into a confederacy with the peishwa and the rajah of Berar against the British. After a protracted war the Mahratta power was finally overthrown (1819), the pe-
ishwa became a fugitive, and his authority was abolished.—See Grant Duff's "History of the Maharratas" (3 vols. 8vo, London, 1826), and Owen's "India on the Eve of the British Con-
quest" (London, 1872).

MAI, Angelo, an Italian scholar, born near Berga-
no, March 7, 1782, died at Albano, Sept. 9, 1854. He entered the novitiate of the society of
Jesus, and in 1813 was named an associate of the Ambrosian college, and soon after one of the
sixteen attached to the Ambrosian library at Milan. When the society of Jesus was formal-
ly revived by Pope Pius VII. in 1814, Mai, who had never taken the solemn vows of the order,
was induced to remain a member of the secur-
al clergy. In 1819 he became chief keeper of
the Vatican library at Rome, soon after libra-
rian, and in 1825 supernumerary prothonotary
apostolic. In 1833 he was appointed secretary
of the propaganda, and in 1838 prefect of the
congregation of the Index and cardinal. His li-
terary reputation was established by his careful
exploration of the Ambrosian library, and by
several important discoveries in the then almost
unknown department of palimpsests. Among
his discoveries in Milan were fragments of the orations of Cicero in defense of Scævulus,
Tullius, and Flaccus, and against Clodius (Milan, 1814); several orations of Cornelius Fronto, and sev-
eral letters of the emperor Marcus Aurelius and of Lucius Verus (Milan, 1815; new ed., Rome, 1846); a fragment of eight orations of Q. Aure-
lius Symmachus (Milan, 1815; new ed., Rome,
1846); the complete oration of Iesus on the inheritance of Cleonymus (Milan, 1815); an oration of Themistius (1816); several books of the "Roman Antiquities" of Dionysius of Hal-
carnassus (1816); an Itinera irium Alexandri,
and a work of Julius Valerius, Res Gestae Alex-
andri (1817); fragments of Eusebius and Philo,
and of Eusebius's Chronicon Canonum Libri
duo (1818), which he restored, in conjunction
with Dr. Zohrab, from an Armenian manu-
script; and fragments of the Iliad from the oldest known manuscripts (Milan, 1819). He also
discovered at Rome the long-sought work of Cicero, De Republìca (Rome, 1822). As keeper of
the Vatican library, Mai resolved to publish collections of the unpublished sacred as well as profane authors from the Vatican
manuscripts, similar to those of Muratori, Ma-
billon, and Montfaucon, leaving to future
scholars the task of critically editing, com-
menting, and translating. On this plan he pre-
pared the magnificent Scriptorum Veterrm
Novæ Collectio et Vaticanae Codicibus edita (10
vols. 4to, Rome, 1825-38), Auctores Classici e
Vaticanis Codicibus editi (10 vols. 8vo, 1828-
38), and the Epitexitium Romanum (10 vols.,
1839-44). His last publication, Nova Patrum
Bibliotheca (6 vols., 1845-53), forms an in-
dispensable supplement to almost all collective
editions of the church fathers. He had also
prepared an edition of the celebrated Biblical
Codex Vaticanus, but died before the comple-
tion of the work, which was published by Ver-
cellane (Rome, 1857).

MAIDSTONE, a municipal and parliamentary
borough and market town of Kent, England,
on the Medway, 27 m. W. by S. of Canterbury,
and 32 m. S. S. E. of London; pop. in 1871,
26,196. The principal manufacture is paper.
It consists chiefly of four principal streets, in-
tersecting at the market place, well paved, and
lighted with gas. It contains a county jail oc-
cupying an area of 33 acres, one of the largest
parochial churches in England, supposed to be
of the 14th century, several other churches,
schools, and charitable institutions. All Saints'
college, founded in 1846, is kept in the build-
ing of the old college of All Saints, suppressed
by Edward VI. The navigation of the Med-
way has been improved, so that vessels of
above 70 tons can reach Maidstone.

MAILTHÁ, János Nepomuk, count, a Hungarian
historian, born in Pesth, Oct. 5, 1786, died Jan.
3, 1855. He was employed in the public ser-
vice of Hungary until a disease of the eyes
compelled him to relinquish his post; he re-
sumed it at a subsequent period, but was finally
thrown out of office by the revolution of
1848. Poverty induced him to emigrate with
his daughter Henrietta to Vienna, and subse-
quently to Munich; and to escape becoming a
burden to their friends, father and daughter
drowned themselves in the lake of Starnberg.
He wrote Geschichte der Magyaren (5 vols.,
Vienna, 1828-31); Der ungarische Reicheit
1830 (Pesth, 1831); Geschichte der Stadt Wien
(1832); Geschichte des österreichischen Kaiser-
hauses (5 vols., Hamburg, 1834-50); and other
works, including original poems and numer-
ous translations from the Hungarian.

MAIMACHIN. See KIACHTA.

MAIMBOURG, Louis, a French historian, born
in Nancy about 1620, died in Paris, Aug. 13,
1686. At the age of 16 he entered the society of
Jesus, and in 1682 he was expelled for defend-
ing the tenets of the Gallican party; but Louis
XIV. settled a pension on him. At the time of
his death he was writing a history of the English
reformation. He published Traité his-
torique sur les prérogatives de l'Eglise de Rome
(1651; new ed., 1881); Histoire du Wiclia-
nisme (the Hague, 1682); Histoire du Luthé-
rianisme (1686); and Histoire du Calvinisme
(Paris, 1686). A uniform edition of his his-
tories appeared in 1686-7 (14 vols. 8vo, Paris).

MAIMONIDES, Moses (Heb. Rabbi Moshe ben
Maimon, commonly abridged into the initial
name Maimonides: Arab. Abu Amram Musa ibn Abdallah ibn Maimon ul-Kortobi, a Jewish theologian and philosopher, born in Cordova, Spain, March 30, 1135, died in Cairo, Egypt, Dec. 13, 1204. He was the descendant of a family distinguished in the annals of the Jewish community of his native city, at that period a principal seat of Arabic learning, and received from his father Maimon, a theological and astronomical writer in Arabic, a superior education. He was distinguished by a rare proficiency in mathematics, astronomy, medicine, philosophy, and theology, as well as by a surpassing ability as a writer in Arabic and Hebrew. In consequence of the great persecution of Jews, Christians, and sectarian Mohammedans by the dynasty of the Almohades in Cordova, he retired with his father to Fez, and subsequently proceeded to Egypt (1165), passing through Acre and Jerusalem, where his father died. He established himself in Mitzar or Fostat (Old Cairo), where he maintained himself for some time by trade, until his scientific acquirements secured his appointment as physician to the court of Saladin, which office he also held under two succeeding reigns. At the same time he was active as a rabbi in the Jewish congregation of Cairo, and especially as a theological teacher, his fame attracting numerous pupils even from the most distant countries of the West. But he exercised a far more powerful influence upon his brethren by his numerous writings, with few exceptions in Arabic, almost all of which have since been acknowledged as standard works. The most distinguished Hebrew translators of the age vied in spreading his masterpieces all over the Jewish world, and thus enabled him to become almost the second lawgiver of his people, and to inaugurate among them a period of literary and philosophical activity, which is still regarded as the golden age of the Jews in exile. Of his works, of which numerous original MSS. are extant in the libraries of Oxford, Rome, Paris, &c., embracing among others treatises on medicine, mathematics, and astronomy, the most frequently reprinted (in Hebrew translations or original) are: Perush hammishnah ("Commentary on the Mishnah"), including an introduction and an ethical treatise known under the title of Shmonah perakim ("Eight Chapters"); Sepher hammitzoth ('The Book of the Commandments'), a systematic compend of the Biblical commandments, both positive and negative, according to the rabbis amounting to the number of 613; Milloth hasippayan ("The Terms of Logic"); Miskneh torah ("The Copy of the Law"), a general code of Jewish observances, written originally in Hebrew, in many respects the most extraordinary strictly rabbinical production, generally known under the appellation of Yad hassakah ("The Strong Hand"), from its 44 divisions, Yad signifying hand, and the numerical value of the letters of which the word is composed being 44; and Moreh nebuchim ("The Guide of the Perplexed"), a philosophy of Judaism, which from its influence on the development of Jewish science and genius is the most important production of the author. The original Arabic text of the last named work, in Hebrew letters, from an Oxford manuscript, was published with a French translation and notes by S. Munk (Le guide des égarés, traité de théologie et de philosophie par Moïse ben Maimon, 3 vols., Paris, 1856-'66). Some of the views of Maimonides having been violently attacked by various western rabbis, his orthodoxy and the rights of philosophy in the synagogues were vindicated among others by his learned son and successor as physician to the Egyptian court, Abraham ben Moses.

Maine, one of the New England states, the most easterly of the American Union, and the tenth admitted under the constitution, between lat. 42° 57' and 47° 32' N., and lon. 66° 52' and 71° 6' W.; extreme length N. and S. 303 m., extreme width 212 m.; area, 35,000 sq. m. It is bounded N. and S. by Quebec, E. by New Brunswick, S. E. and S. by the Atlantic ocean, and W. by New Hampshire. As established by the treaty of 1842, the boundary on the east is the St. Croix river and a line running due N. from a monument at its source to St. John river; on the north the line follows the St. John and St. Francis rivers to a monument at the outlet of Lake Pohemagogook; and on the northwest it follows the highlands from this lake in a S. W. direction.
MAINE

29

to the N. E. corner of New Hampshire. Maine is divided into 16 counties, viz.: Androscoggin, Aroostook, Cumberland, Franklin, Hancock, Kennebec, Knox, Lincoln, Oxford, Piscataquis, Sagadahoc, Somerset, Waldo, Washington, and York. The cities are Augusta, the capital (pop. in 1870, 7,308), Auburn (5,169), Bangor (18,284), Bath (7,371), Belfast (5,278), Biddeford (10,282), Calais (5,944), Ellsworth (5,257), Gardiner (4,497), Hallowell (3,007), Lewiston (13,600), Portland (31,413), Rockland (7,074), and Saco (5,755). Portland is the leading commercial city. The largest towns are Brewer (3,214), Brunswick (4,687), Bucksport (3,483), Camden (4,512), Cape Elizabeth (5,106), Deer Isle (3,414), Eastport (3,736), Ellsworth (5,257), Farmington (3,251), Gorham (3,351), Hampden (3,068), Kittery (3,839), Skowhegan (3,393), Thomaston (3,993), Waldobrogh (4,174), Waterville (4,822), and Westbrook (6,658).—The population of Maine and its rank in the Union, according to the federal enumerations, have been as follows:

Of the total population in 1870, 313,105 were males and 313,826 were females; 578,034 were native and 48,881 foreign born; and there were 499 Indians and 1 Chinaman enumerated. Of those of native birth, 550,629 were born in Maine, 1,139 in Massachusetts, and 9,753 in New Hampshire. Of the foreigners, 26,788 were born in British America, 13,745 in Ireland, and 3,650 in England. The density of population was 17.91 to a square mile. There were 131,017 families, with an average of 4.78 to each, and 121,958 dwellings, with an average of 5.14 to each. Between 1860 and 1870 there was a decrease of 1,364 or 0.22 per cent. in the total population, this being the only state except New Hampshire in which there was a loss. The number of male citizens 21 years old and upward was 153,160. There were 173,958 persons from 5 to 18 years of age; the total number attending school was 158,140. Of persons 10 years of age and over, 13,486 were unable to read, and 18,052 could not write, of whom 9,646 were males and 9,406 females, making the percentage of illiterates 10 years old and over, to the total population (498,847) of the same age, 3.86, which is less than in any other state except Nevada, where the percentage was 2.38, and New Hampshire, where it was 3.81. In the total number (169,829) of male adults, 6,555, or 3.88 per cent., were illiterates; and of 174,068 adult females, 6,834, or 3.91 per cent. The number of paupers supported during the year ending June 1, 1870, was 4,619, at a cost of $367,000. Of the total number (8,631) receiving support, June 1, 1870, 3,188 were natives and 443 foreigners. The number of persons convicted of crime during the year was 491. Of the total number (371) in prison June 1, 1870, 261 were of native and 110 of foreign birth. There were 324 blind, 299 deaf and dumb, 792 insane, and 628 idiotic. Of the total population 10 years of age and over (498,847), there were engaged in all occupations 208,225, of whom 179,784 were males and 28,441 females; in agriculture, 82,011, of whom 24,738 were agricultural laborers, and 56,941 farmers and planters; in professional and personal services, 36,692, including 890 clergymen, 11,531 domestic servants, 13,835 laborers not specified, 558 carriers, 818 physicians and surgeons, and 4,183 teachers not specified; in trade and transportation, 28,115, of whom 11,670 were sailors; in manufactures and mechanical and mining industries, 62,007, including 2,697 blacksmiths, 3,757 boat and shoe makers, 6,474 carpenters and joiners, 3,896 fishermen and oystermen, 1,765 lumbermen and raftsmen, 4,187 saw-mill operatives, 2,256 ship carpenters, 2,432 woolen-mill operatives, 8,774 cotton-mill operatives, and 1,131 mill and factory operatives not specified. The total number of deaths from all causes was 7,728; from consumption, 1,961; there being 39 deaths from all causes to 1 from consumption; from pneumonia, 495, or 16.6 deaths from all causes to 1 from pneumonia; from diphtheria and scarlet fever, 502; from intermittent and remittent fever, 39; from cerebro-spinal, enteric, and typhus fevers, 641; from diarrhoea, dysentery, and enteritis, 269. According to the census of 1870, there was a greater number of deaths from consumption in Maine, in proportion to the total mortality, than in any other state, the ratio being 25.56 deaths from consumption in 100,000 deaths from all causes; while in New Hampshire, the state ranking next in this respect, the ratio was 22.209 in 100,000.—The coast of Maine extends in an E. N. E. direction, from Kittery point on the west to Quoddy head on the east, about 218 m. in a straight line; but following its exact outline, and including the islands, the length of shore line is 2,486 m. It is studded with numerous islands, and indented by many bays and inlets, forming excellent harbors. The largest island is Mount Desert, having an area of 60,000 acres, and lying W. of Frenchman's bay. Its formation is very peculiar, and its scenery picturesque and striking. Thirty peaks, the highest of which has an elevation of about 1,800 ft., rise from its surface from W. to N. Besides this, the principal islands are Isle au Haut, off the entrance of Penobscot bay, in which are Deer, Long, and Fox islands, and the Isles of Shoals, a group of eight belonging partly to New Hampshire. Among the largest bays are Pas-
Samaquoddy, Machias, Pleasant, Frenchman's, Penobscot, Mascoungus, Casco, and Saco. Maine is abundantly supplied with watercourses. The Walloostook, flowing into the St. John in the north, and the Aroostook in the east, cloth with numerous tributaries, drain the N. portion of the state. The St. Croix, which flows S. into Passamaquoddy bay, forms a portion of the E. boundary between Maine and New Brunswick. The Penobscot, flowing into Passamaquoddy bay, is the largest river, draining with its branches and connecting lakes the centre of the state, and navigable for large vessels to Bangor, 55 m. from its mouth. The Kennebec, W. of the Penobscot, affords great and valuable water power, and is navigable for ships to Bath, 12 m., and for smaller boats to Augusta, 50 m. from its mouth. Further W. are the Androscoggin and Saco. On the southwest the Piscesqua separates Maine from New Hampshire. Several of the rivers have falls of considerable note. Scattered over the surface of the state is a great number of lakes, the largest of which is Moosehead, 35 m. long and from 4 to 12 m. wide; among others are Sebago, Umbagog, Chesmook, Bashakegan, Long, Portage, Eagle, Madawaska, Pemigewassett, Millinocket, Sebec, and Saco. —The surface is generally hilly, mostly toward the coast, but rising in the interior. A broken chain of eminences, apparently an extension of the White mountains of New Hampshire, crosses the state from S. W. to N. E., terminating in Mars hill on the borders of New Brunswick. The highest elevation in the range is Mt. Katahdin, 5,585 ft. above the sea. Saddleback, Bigelow, Abraham, North and South Russell, and Haystack are among the others best known. —Maine is almost exclusively a region of the azoic rocks. The W. portion of the state is granite. The metamorphic rocks abound in a great variety of interesting minerals, and Paris, Oxford co., is noted for its beautiful colored tourmalines; Parsonsfield, York co., and Plattsburg, on the coast of Lincoln co., for varieties of garnet and various other minerals; Brunswick and Topsham for felspar, &c.; and Bowdoinham for beryls. Over the surface of the country the drift formation is everywhere spread in the form of bowlders and sand and gravel. Even upon the highest summits are found scattered rounded fragments of formations situated in places farther N. Along the S. portion of the state deposits of tertiary clays are found in many localities beneath the drift. They are characterized by beds of shells of the common clam and mussel, and consequently belong to the newer pleiscene. They extend into the interior as far as Augusta and Hallowell, and are penetrated by wells sunk 50 ft. or more below the surface. Limestone quarries are worked in many places among the metamorphic rocks. Along the shore of Passamaquoddy bay are beds of red sandstone, probably of the age of the Connecticut river sandstone. It is pene-

trated by dikes of trap, and at the contact of the two rocks are developed many interesting minerals. On Campbell's island and on the shores of Cobuscook bay veins of galena are found of some promise at the contact of trap dikes and argillaceous limestone. Trap abounds in this portion of the state, and in the interior it forms hills of considerable extent. The sources of the rivers are in a wild mountainous territory spreading over the central portion of the state. The mountains are in scattered groups, with no appearance of regular ranges. Their structure is of the metamorphic rocks; and so far as explored they present little of economical importance. On the Aroostook are numerous beds of limestone and one large body of red hematite. Argillaceous slates and limestones prevail over the N. portion of the state. —Maine is said to be rich in minerals, especially in Aroostook, Piscesqua, and Washington co. Besides marble, slate, granite, and limestone, which are sources of wealth, iron, lead, tin, copper, zinc, and manganese exist. There is also abundance of material for the profitable manufacture of alum, coppers, and sulphur. Granite is obtained in blocks of immense size, some weighing more than 100 tons each. It is of fine grain, beautiful in color, and very 15-90%. The marble is better adapted for building than for ornamental purposes. The principal belt of roofing slate, which is found in immense quantities, extends from the Kennebec to the Penobscot river, a distance of about 80 m. The principal quarries are in Piscesqua co. Most of the slate is suitable for tables, blackboards, writing slates, and pencils. Few attempts have been made to work metallic ores. —The climate is one of extremes. In the year the temperature ranges between 20° or 30° below to 100° above zero; and isothermals lines vary with the latitude from 15° 72' F. The following meteorological summary for Portland is 48° 40' N. and lon. 7° 14' W., has been reported by the United States signal bureau:

</table>

In the extreme northern part of the state the temperature ranges from 5° to 10° lower. The winters are severe, but the temperature is uniform and not subject to violent changes. The snow lies on the ground for from three
to five months. The northeast winds from the Atlantic in the spring and early summer, charged with cold fogs, constitute an unpleasant feature in the climate of a portion of the state.—The soil varies greatly, being sterile in the mountains and fertile in the valleys; the most productive land lies between the Kennebec and Penobscot and in the valley of the St. John. Great forests cover the central and N. portions of the state, yielding immense quantities of timber, which constitutes one of the leading sources of wealth. The most prevalent trees are the pine, spruce, and hemlock; maple, birch, beech, and ash are common, and the butternut, poplar, elm, sassafras, and a variety of others are found in particular districts. Apple, pear, plum, and cherry trees thrive, but the peach has not been cultivated with success. The dense forests still afford retreats for the moose and caribou. There are also the bear, deer, wolf, black-tail, wolverene, beaver, marten, sable, weasel, raccoon, woodchuck, squirrel, &c. Wild geese and ducks, eagles, hawks, partridges, pigeons, owls, quails, crows, and humming birds are among the most common birds. The waters off the coast abound with fish, chiefly cod, herring, menhaden, and mackerel; and salmon, trout, pickerel, &c., are found in great abundance in the lakes and rivers.—According to the census of 1870, there were 59,804 farms, containing 2,917,798 acres of improved land, 2,224,740 of woodland, and 993,523 of other unimproved land. The cash value of farms was $102,961,951; of farming implements and machinery, $4,809,113; total amount of wages paid during the year, including the value of board, $2,903,292; total (estimated) value of all farm productions, including betterments and additions to stock, $83,470,044; of orchard products, $874,569; of produce of market gardens, $386,897; of forest products, $1,581,741; of home manufactures, $450,988; of animals slaughtered or sold for slaughter, $4,300,074; of all live stock, $28,937,129. The agricultural productions were 278,793 bushels of wheat, 1,089,888 of Indian corn, 34,115 of rye, 2,351,354 of oats, 658,816 of barley, 466,635 of buckwheat, 264,502 of peas and beans, 7,771,363 of potatoes, 9,114 of grass and clover seed, 1,053,415 tons of hay, 5,435 lbs. of flax, 1,774,168 of wool, 296,850 of hops, 11,636,482 of butter, 1,152,590 of cheese, 160,805 of maple sugar, 155,640 of honey, 5,253 of wax, 1,374,091 gallons of milk sold, 28,470 of maple molasses, and 7,047 of wine. There were on farms 71,514 horses, 333 miles and asses, 139,259 milch cows, 60,530 working oxen, 148,272 other cattle, 434,666 sheep, and 45,760 swine.—The leading industries are directly connected with the natural yield of land and water, the most characteristic being the production of lumber and lime, the packing of ice, fish, and vegetables, ship building, and stone quarrying. It is estimated that the forests cover 10,506,711 acres, or very nearly one half the entire area of the state. This is not exceeded in any of the other great lumber-producing states except Michigan and Pennsylvania; while the ratio of the woodland to the entire area is greater in Maine than in any other state. The abundant water power renders the use of steam necessary in only a small number of mills. The great lumber mart is Bangor, where the amount surveyed during the season reaches about 200,000,000 ft. The most important centres of this industry are Penobscot co., where a capital of about $2,000,000 is employed; Washington co., about $1,500,000; Hancock, Kennebec, and Piscataquis cos. According to the census of 1870, the number of saw mills was 1,099, having 76 steam engines of 3,813 horse power, and employing 8,506 hands. The capital invested amounted to $6,014,875; wages, $2,449,132; materials, $8,872,753; products, $11,305,747. Ship building, which declined during the civil war, has within a few years attained a prosperity exceeding that of former times. In 1870 Maine ranked next to New York and Pennsylvania in the value of work completed, and next to New York in 1873. In the former year 116 establishments were reported, employing 1,810 hands, and a capital of $908,173; the value of materials used was $1,267,146, and of products, $2,305,745. During the year ending Jan. 1, 1874, there were built in the state 276 vessels of 89,917 tons, being the largest tonnage ever built in one year. Among the vessels were 10 ships of 14,584 tons, 25 barques, 12 brigs, 206 schooners, 12 sloops, and 9 steamers. The principal yards are at Passamaquoddy, Machias, Frenchman's Bay, Castine, Bangor, Belfast, Waldoborough, Wiscasset, Bath, Portland and Falmouth, and Kennebunk. According to the census of 1870, the products of the Maine fisheries, exclusive of the whale fisheries, were exceeded only by those of Massachusetts, the value being $979,610. This included 79,373 quintals of cod fish, 2,475 of haddock, 10,955 of hake, 2,663 barrels of herrings, 31,901 of mackerel, and 75,534 of miscellaneous fish, besides 40,011 barrels of fish oil. The value of fish cured and packed was $617,878. In 1873, 861 vessels of 46,196 tons were engaged in the cod and mackerel fisheries. About 2,000 men are employed in this industry. The propagation of salmon and trout by artificial means in the interior waters is carried on with success under the direction of the state commissioners of fisheries. Along the coast, from Yarmouth to Cape Sable, the packing of fish, lobsters, clams, &c., is extensively carried on. The catching of lobsters is perhaps more extensive here than anywhere else in the country. The canning of vegetables in the interior is an important industry. The value of canned products in 1873 was $1,842,000; the number of cans was 735,700 dozens, embracing 475,000 dozen cans of corn, 7,500 of succotash, 231,000 of lobsters, 20,000 of salmon, and 1,600 of clams. Ice is gathered
chiefly in Kennebec and Knox cos. for exportation to various parts of the world. In 1873, 24 establishments cut 301,000 tons, valued at $3,559,000. Most of the granite quarries are on the coast, the principal ones being in Knox and Lincoln counties. Here the granite is dressed and shaped for use in buildings in distant parts of the country. The stone quarried in 1870 was valued at $536,758, and the slate at $85,000. According to the census of 1870, Maine had more capital invested in the production of lime than any other state except New York, and produced more in value than any except Pennsylvania; the capital invested amounting to $1,058,000, and the products to $1,741,553.

The industrial interests of Maine have been greatly extended in recent years, the condition of the most important industries in 1873, according to the state industrial statistics, is approximately given in the following statement, the number of establishments making returns being less than the actual number:

According to the same authority, the total number of establishments devoted to manufacturing and mechanical industry was 6,072, employing 55,614 hands; the capital invested amounted to $48,805,448; materials used, $57,911,465; wages paid, $16,684,164; value of products, $96,209,136. The extensive sea-coast and numerous harbors of Maine give the state great facilities for commerce. The harbor at Portland is one of the best on the Atlantic coast. There are 14 United States customs districts, viz.: Aroostook (port of entry, Houlton), Passamaquoddy (port of entry, Eastport), Machias, Frenchman’s Bay (port of entry, Ellsworth), Castine, Bangor, Belfast, Waldoborough, Wiscasset, Bath, Portland and Pophamp, Saco, Kennebunk, and York. The imports from foreign countries and domestic exports for the year ending June 30, 1874, were as follows:

Besides these, there were entered in the coaster trade and fisheries 2,291 vessels of 1,124-127 tons, and cleared 1,526 of 847,178 tons. Of the total number registered, enrolled, and licensed, 3,157 of 5,575,953 tons were sailing, and 63 of 18,955 tons were steam vessels. The transit and shippersment trade at Portland is larger than that of any other port in the United States. Maine had 11 miles of railroad in 1841, 293 in 1851, 473 in 1861, 871 in 1871, and 945 in 1874. A board of three railroad commissioners, appointed by the governor and council, are required to examine into and report upon the condition of the railroads in the state, the cause of accidents, &c. The lines in operation at the beginning of 1875, with their mileage, were as follows:

Of the lines above mentioned, the Androscoggin, Belfast and Moosehead Lake, Leeds and Farmington, Portland and Dexter, and Portland and Kennebec are leased and operated by the Maine Central company; the Portland, Saco, and Portsmouth, by the Eastern of Massachusetts; the Atlantic and St. Lawrence by the Grand Trunk of Canada; and the Bangor and Piscataquis by the European and North American railway company. Lines of steam-
ers ply regularly between the larger cities and Boston. Steamers also ply between Portland, New York, St. John, N. B., and Halifax, and during the winter between Portland and Liverpool and Glasgow. The number of national banks in operation in 1874 was 64, having a paid-in capital of $9,840,000, and a circulation outstanding of $7,946,576. The circulation per capita was $12.67, while the ratio of circulation to wealth was 2.2 per cent., and to bank capital 80.8 per cent. Savings banks are well distributed throughout Maine, and are managed with great care. In 1874 there were 63, with $31,051,963 deposits and $6,799 depositors, the average amount on deposit by each being $820. The deposits in these institutions amount to nearly $5,500,000 more than the circulation and deposits of the national banks of the state. The number of fire, marine, and fire and marine insurance companies doing business in the state, Jan. 1, 1874, was 129, of which 41 were Maine companies. The government of Maine is founded on the constitution of 1820. Every adult male citizen of the United States, not a pauper or criminal, who has resided in the state three months, is entitled to vote at elections. The legislature is composed of a senate of 31 members and a house of representatives of 151 members, all elected annually by the people. The general election is held on the second Monday in September, and the legislature meets in Augusta on the first Wednesday in January annually. The governor (salary $2,500) is also elected annually, and is assisted in his executive duties by a council of seven members, elected on joint ballot by the legislature. The secretary of state (salary $1,500) and the state treasurer (salary $1,600) are also elected by the same body and in the same way. Other state officers are the attorney general, adjutant general, superintendent of common schools, land agent, insurance commissioner, bank examiner, three railroad commissioners, superintendent of public buildings, librarian, two assayers, inspector general of beef and pork, inspector general of fish, two commissioners of fisheries, industrial statistician, and two Indian agents. The governor appoints, with the advice and consent of the council, besides certain judicial officers, the attorney general, the sheriffs, coroners, registers of probate, and notaries public. The judiciary consists of a supreme court of eight judges, who are appointed by the governor and council for a term of seven years, and receive a salary of $3,000 a year each; the superior court of Cumberland co., held in Portland, with one judge appointed in the same way and for the same term; probate courts in each county, the judges being elected by the people for terms of four years; municipal and police courts; and trial justices appointed by the governor and council for seven years, with jurisdiction where the amount does not exceed $20. The state is divided into three judicial districts, eastern, middle, and western, in each of which the supreme court holds an annual session as a court of law. Trial terms are also held in each county for civil and criminal business, except that in Cumberland co., the superior court has exclusive criminal jurisdiction. In each county there is a judge and register of probate. There is a state board of immigration, consisting of the governor, secretary of state, and land agent, who are required to appoint a commissioner of immigration. The board may give to each male adult immigrant 100 acres of the public land on which to settle. It is the duty of the industrial statistician, which office was created in 1873, to collect and publish statistical information concerning the manufacturing, mining, commercial, agricultural, and other industrial interests, together with the valuation and appropriations for various purposes of the several towns and cities of the state. Maine is represented in congress by two senators and five representatives, and has therefore seven votes in the electoral college. The laws for the prevention of intemperance in Maine have always been of a rigid character. The present law vests the sale of intoxicating liquors in specie and wine appointed by the state, and prohibits all other persons from selling such liquors, including ale, porter, strong beer, lager beer, and other malt liquors, wine, and cider, as well as distilled spirits. The manufacture of intoxicating liquors for unlawful sale is also forbidden. The provisions of the law, however, do not extend to the manufacture and sale of unadulterated cider or wine made from fruit grown in the state. The lawful sale of liquors is under the direction of a commissioner who is appointed by the governor, and who is required to furnish municipal officers of towns in Maine, and duly authorized by the state, to obtain a license to sell pure unadulterated intoxicating liquors, to be sold for medicinal, mechanical, and manufacturing purposes. If an authorized agent violates the law, he is subject to a fine not exceeding $50, and imprisonment not exceeding three months; while the penalty for a violation by a common seller is $100 fine or three months' imprisonment for the first, and $250 fine and four months' imprisonment for the second and each subsequent offence. Any one having been injured by an intoxicated person may maintain an action for damages against the person who sold the liquor; and the owner or lessee of the building in which the liquor was sold is jointly liable to the injured person. A married woman may hold in her own right personal and real estate acquired by descent, gift, or purchase, and may convey or devise the same by will, without the consent of her husband, except such real estate as has been directly or indirectly conveyed to her by her husband or his relatives, in which case the husband must join in the conveyance. A woman does not lose and a husband does not acquire rights to her property by marriage. The husband is not liable for the debts of the wife.
contracted before marriage, nor for those afterward contracted in her own marriage; but she is liable in both cases, and may be sued. Marriages, births, and deaths must be registered in every town, and reported to the secretary of state. Intention of marriage must be recorded in the office of the town clerk at least five days before the certificate is granted, and the marriage must be solemnized by a minister or justice of the peace. White persons are prohibited from marrying negroes, Indians, or mulattoes. Treason, murder in the first degree, and arson of an occupied dwelling in the night, are punishable with death; so also is killing in a duel, and the seconds are liable to the same punishment as the principals. Rape, arson of a dwelling in the day time, and burglary at night by a person armed with a weapon, or making an assault, are punishable with imprisonment for life. Adultery is punished with imprisonment for not less than one nor more than five years.—The receipts into the state treasury during the year ending Jan. 1, 1875, amounted to $1,432,473, and the expenditures to $1,524,497. Of the receipts, $142,285 was from the tax on savings banks, and $238,276 on public lands, while nearly all of the remainder, about $1,170,000, was from direct taxation. Of the expenditures, $432,200 was on account of interest, and $238,276 on account of sinking fund and principal of public debt; about $82,000 for special and exceptional appropriations; $407,477 to towns for common schools; and about $220,000 for general state purposes. On Jan. 1, 1875, the entire amount of the public debt was $7,088,400, of which $2,225,000 was in registered and $4,863,400 in coupon bonds. Deducting the sinking fund ($1,014,029) held for the payment of the debt, the liability of the state amounted to $5,574,378. While in many other states a large portion of the public revenues is raised by indirect taxation, in Maine nearly the entire amount is derived from direct taxes. The rate on the valuation of 1874 was five mills on the dollar. The total value of real and personal property in 1874, estimated on a true cash basis, was stated at $254,000,000. The assessed value of real estate, as returned by the census of 1870, was $394,580,157, and of personal property $69,673,829; the true valuation of real and personal estate was $348,155,671. The total amount of taxation not national was $5,348,645, of which $1,350,305 was state, $315,199 county, and $3,683,141 town, city, &c.—The institutions supported wholly or in part by the state are the insane hospital, reform school, state prison, soldiers’ orphans’ home, and two normal schools. The insane hospital in Augusta was opened in 1840, since which time 4,404 patients have been received, of whom 4,011 have been discharged, 1,777 recovered, 767 improved, 675 improved, and 792 have died. The daily average under treatment in 1874 was 406. Of the 393 in the hospital at the close of the year, 43 were supported by the state, 291 were receiving state aid of $1.50 per week, and 59 were supported by their friends at the rate of $4 or $7 per week, according to accommodations. The capacity of this institution is inadequate to the needs of the state, and provision has been made for the erection of another. The total expenditures on account of the hospital in 1874 were $103,917, of which the state paid about $54,000 for the support of indigent insane, and towns and individuals about $56,000. Maine has no state institutions for the care of the deaf and dumb or the blind; but $14,179 was paid from the treasury in 1873 for the education in other institutions of 55 deaf and dumb and 11 blind beneficaries. The state prison at Thomaston at the beginning of 1874 contained 129 convicts, of whom 55 were under sentence for larceny, 20 for burglary, and 12 for murder. The average annual number of commitments during the ten years ending with 1873 was about 51. With the exception of a period of about eight years, the state has always employed the labor of the convicts in manufacturing operations on its own account, producing carriages, harness, and boots and shoes. In 1873 the labor of the convicts defrayed all the expenses of the institution, and yielded to the state a net profit of $6,545. During the 20 years ending with 1873 the sales of the product of convict labor amounted to $614,028. A beginning has been made of introducing this system of industry into the various county jails. The average number of convicts in the 13 jails of the state in 1873 was 76, making with the average number in the state prison (146) a total of 222. The reform school, opened in 1852, is about 4 m. from Portland, where a farm of 100 acres is devoted to the purposes of the institution. Boys between the ages of 8 and 16 years are received, and besides attending school four hours a day are occupied in farming, making bricks, shoes, and chairs, and in general housework. The average number of boys in 1874 was 137, and the appropriation by the state amounted to $20,000. An industrial school for girls was opened in Hallowell in 1875. The military and naval orphan’s asylum at Bath affords a home for the children of the soldiers who died in the civil war. The number of inmates at the close of 1874 was 85; state appropriation, $10,000. There is also a general orphan asylum in Bangor, which receives state aid. The Maine general hospital in Portland is aided by the state.—The educational interests of the state are under the supervision of a state superintendent, appointed by the governor and council, and there are city superintendents. Every city, town, and plantation is required to raise and expend annually for the support of schools therein not less than $1 for each inhabitant, under penalty of not receiving any share of the state school fund. The permanent school fund, derived chiefly from the sales of wild lands belonging to the state, amounts to $369,883. Besides the income of this fund, the
chief sources of revenue for school purposes are a state tax of one mill per dollar of valuation, a tax of 80 cents per capita, and a tax of one half mill per dollar of the deposits of savings banks. The cost of supporting the public schools in 1874 (current expenses) was $1,297,778, being about '005 on the state valuation, $1 97 for each inhabitant, $6 48 for each person of school age, and $11 21 for each according to the average attendance. The school funds are appropriated among the several towns according to the number of persons between 4 and 21 years of age. The chief facts relating to the schools of the state are as follows:

| Number of persons between 4 and 21 years of age. | 225,319 |
| Registered in summer schools. | 122,458 |
| Average attendance. | 93,744 |
| Number registered in winter schools. | 182,928 |
| Average attendance. | 105,478 |
| Average duration of schools for the year, 20 weeks and 2 days. | 4,043 |

| Excess above amount required by law. | $187,742 |
| Amount raised per scholar. | $2 90 |
| " received from state treasury during 1874. | $307,009 |

By a recent act of the legislature a system of free high schools throughout the state has been established, the state defraying one half the cost of instruction upon certain conditions. In 1874 there were 355 terms of free high schools open, with 14,820 pupils enrolled. The amount paid by the state in aid of these was $39,960. Sixteen teachers' institutes were held in 1874, besides numerous educational conventions and associations. The normal schools are under the direction of seven trustees, five of whom are appointed by the governor, who, with the superintendent of common schools, is an ex officio member. The western state normal school at Farmington was established in 1863, and in 1873-'4 had 8 instructors and 68 students during the autumn and 86 during the spring term, besides 31 in the model school. The course occupies two years, and tuition is free to those pledging themselves to teach in the public schools of Maine for as long a period as they have been connected with the normal school. The eastern state normal school at Castine was opened in 1867, and in 1873-'4 had 8 instructors and 94 students in the autumn, 58 in the winter, and 130 in the spring term; 170 of the total were females, and 112 males. Tuition is free, but graduates are expected to become teachers in the public schools of the state. In 1873 the state appropriated $17,500 for normal schools. The state college of agriculture and the mechanical arts, at Orono, has received the grant of public lands made by congress for the establishment and maintenance of such institutions in the several states. A farm of 370 acres of superior land affords excellent facilities for the experimental purposes of the institution. Five courses of instruction are offered: in agriculture, civil engineering, mechanical engineering, chemistry, and an elective course. The studies of the several courses are essentially in common during the first two years. Prominence is given to military instruction, and the students are required to devote not exceeding three hours a day for five days in the week to manual labor, for which they receive compensation. This institution was opened in 1868, and in 1874 had 8 instructors and 121 students. It is provided with valuable apparatus and a library of 2,000 volumes. The most prominent educational institutions are Bowdoin college in Brunswick (see Bowdoin college), Colby university (Baptist) at Waterville, and Bates college (Freewill Baptist) at Lewiston. Colby university was organized in 1820, and in 1874 had 7 instructors and 62 students; the library contains about 10,000 volumes; 66 scholarships, each yielding from $36 to $60 per annum, have been founded for the benefit of students needing aid; the university is open to students of both sexes. Bates college was organized in 1863; connected with it is a theological department, which was opened in 1870; the libraries of the institution comprise 8,300 volumes; in 1874 there were 6 instructors and 104 students, besides 18 students in the theological department. The theological seminary at Bangor (Congregational), established in 1820, is open to the Protestants of every denomination; the course of instruction comprises three years; in 1874 there were 4 professors, 40 students, 520 alumni, and a library of 14,000 volumes. Instruction in medicine is afforded by the medical department of Bowdoin college, which is known as the medical school of Maine, and by the Portland medical school. The Maine Wesleyan seminary, at Kent's Hill, and the Westbrook seminary (University with 24 men and 25 women) also have. Teachers, besides,'are,-afford, to students of both sex--es classical, scientific, normal, and other courses. In 1874 the former had 14 instructors and 389 pupils, of whom 176 were females, and a library of 25,000 volumes, besides valuable collections. The East Maine conference seminary and commercial college, pleasantly situated at Bucksport, is also open to both sexes, and provides several courses of instruction; in 1874 there were 6 instructors and 201 students, including 93 females. According to the census of 1870, there were in the state 3,334 libraries, containing 984,510 volumes; of these, 3,787, with 450,908 volumes, were private, and 1,462, with 533,547 volumes, were other than private, including the state library with 20,000 volumes, 58 town and city with 14,649 volumes, 19 law with 9,748, 25 school, college, &c., with 63,425, 1,079 Sabbath school with 277,742, 140 church with 39,910, and 136 circulating with 100,273. The principal libraries are the state library in Augusta, which in 1874 contained 28,000 volumes; Bowdoin college, 35,000; Portland in-
stitute and public library, 15,378; Bangor theological seminary, 14,000; mechanics' association library of Bangor, 13,700; Colby university, 10,000; Bates college, 8,500; and Hallowell social library, 5,000. The number of newspapers and periodicals was 65, having an aggregate circulation of 170,690, and issuing annually 9,897,680 copies. In 1870 there were 7 daily newspapers, with a circulation of 10,700; 1 tri-weekly, circulation 850; 47 weekly, circulation 114,600; 1 semi-monthly periodical, circulation 700; 8 monthly, circulation 42,840; and 1 quarterly, circulation 1,500. In 1874 there were 9 dailies, 56 weeklies, 1 semi-monthly, 4 monthlies, and 1 quarterly.—The total number of religious organizations in 1870 was 1,326, having 1,102 edifices with 876,038 sittings, and property valued at $3,196,853. The denominations were represented as follows:

—Maine was visited in 1602 by Bartholomew Gosnold; in 1608 by Martin Pring; in 1604 by the French under De Monts, who wintered near the present site of Calais on the St. Croix, and in the following spring took possession of the shores of the river Sagadahoc or Kennebec; and in 1605 by Capt. George Waymouth. In 1607 the Plymouth company, having obtained a grant which included this territory, sent out a colony under George Popham and Raleigh Gilbert, but it remained only one year. In 1613 a French colony fitted out by Mme. de Guercheville, a pious Catholic lady to whom had been transferred the patent of De Monts, landed at Mount Desert, with the purpose of establishing a centre for missionary operations. The Virginia magistrates, however, sent an armed force which dispersed the emigrants and destroyed their settlement. In the following year Capt. John Smith arrived at Monhegan island, and went at once to the Kennebec, where he traded profitably with the Indians, explored the coast, and sketched a short history of the country. In 1620 Sir Ferdinando Gorges obtained a new patent from James I, granting to the Plymouth company all the country between lat. 40° and 48° N., including that upon which the pilgrims landed in the following December. Gorges regarded these persons as intruders, and sub-

sequently endeavored to oust them as well as the Massachusetts colony established under Winthrop at Charlestown and Boston. In 1621 the company transferred to William Alexander, afterward earl of Stirling, the country E. of the St. Croix (then all designated Nova Scotia), thus establishing the E. boundary of Maine as it now stands. Monhegan, the first or one of the first spots in Maine permanently peopled by Europeans, was settled in 1622, and Saco in 1623, or perhaps earlier. About 1629 the Plymouth company began to parcel out their territory in grants to suit applicants. In that year John Mason acquired the territory lying between the Merrimack and Piscataqua rivers, and called it New Hampshire, thereby settling the western boundary of Maine. In the course of two or three years the whole coast had thus been disposed of as far E. as the Penobscot. The country between the Penobscot and St. Croix, and even to the W. of the former river, was claimed by the French, and long remained a subject of dispute. In 1655 the Plymouth company, having resolved to give up its charter to the government, divided the territory among its members, Gorges taking the whole region between the Piscataqua and the Kennebec, of which he subsequently (1639) received a formal charter from Charles I, under the title of the province of Maine. Gorges was now appointed governor general of New England, with almost unlimited powers. (See Gorges.) His son Thomas was sent over as deputy in 1643, and established himself at Agamenticus, now York, where in 1642 arose a city called Gorgiana. On the death of Sir Ferdinando, Maine descended to his heirs. It was now really placed under four different jurisdictions: 1, that of Gorges, extending from the W. line to Kennebunk; 2, that of Rigby, from Kennebunk to the borders of the Kennebec valley, held under grant from Sir Ferdinando; 3, the Sagadahoc, from the Kennebec to the Penobscot; 4, the French (Acadia), from the Penobscot to the St. Croix. Massachusetts, apprehending that these fragmentary and unsettled governments might fall into hands hostile to her interests, and stimulated by the wishes of many of the inhabitants, set up (1651) a claim under her charter to the province of Maine, and sent commissioners to admit the people of Gorges's and Rigby's grants into the jurisdiction of the Bay colony. The governments of Gorges and Rigby remonstrated, and carried the matter before the English parliament; but the Puritan party was now in the ascendency at home, and the claims of the Puritan colony of Massachusetts were heard with more favor than the protests of zealous royalists and adherents of the established church. In 1652, 150 freemen in five towns took the oath of allegiance to Massachusetts, which continued to exercise its authority in such a way as to prove that, however slight its claim to jurisdiction, the transfer was equally beneficial to both parties. The
MAINE

towns were governed in local matters nearly as they are now, and the rules of church discipline were less strict than in some other colonies, the people being generally favorable to religious freedom. No acts of persecution stain their history, and they frequently afforded an asylum to fugitives from intolerance in other parts. In 1653 Cromwell annulled the transfer of Acadia to France, which had been effected in 1632, and sent out Sir Thomas Temple as governor. He retained his post till 1667, when Acadia reverted to France in accordance with the treaty of Breda. In the mean time the Stuarts had been recalled to the throne of England, and the heirs of Gorges petitioned for the restoration of their territory in Maine. Royal commissioners were accordingly sent by Charles II. in 1664 to re-establish the authority of the grantees. Massachusetts resisted, and a conflict of jurisdictions ensued, which was terminated in 1677 by Massachusetts purchasing the interests of the claimants for £1,250 sterling. As early as 1607, according to De Peyster's "History of the Dutch in Maine," the Dutch had attempted to gain and colonize this coast. In 1674 they conquered the coasts of Nova Scotia and Acadia adjacent to the Penobscot, first capturing Fort Pentagoet or Pentagavoit (Castine). In 1676 Cornelis Steenwyck was made governor of the conquered district by the Dutch West India company. The Hollanders, however, were soon after expelled by settlers from Boston. In 1675 the first Indian war in Maine was begun by King Philip, at whose instigation a series of unprovoked attacks were made upon the settlers, and more than 100 white persons were massacred within three months. Thenceforth the savages held the country in terror till 1700. Meanwhile disputes were excited by the claims of the duke of York, who, under a grant from Charles II. of the Dutch territories in North America, professed to hold all that part of Maine lying between the Kennebec and St. Croix rivers. Sir Edmund Andros was commissioned as governor of the duke's territories in New York and Maine; but Massachusetts, having caus'd a new survey of the E. limit of her patent to be made, under which she pushed her boundary forward to the W. shore of Penobscot bay, continued to hold possession of all the colony except Sagadahoc and Penamiquid. When the duke came to the throne as James II., Andros was made governor of New England, and visited Maine, where he was guilty of great extortion. The Massachusetts charter had already been declared forfeit. The revolution of 1688, however, restored things to their former state, and thenceforth the history of the colony of Maine is merged in that of Massachusetts. From the close of Indian hostilities Maine began to make steady progress in civilization and wealth. The war of the revolution affected her but little, but during that of 1812 she was again exposed to the horrors of frontier struggles. The British obtained possession of a part of the country, and kept it until the conclusion of peace. The final separation of Maine from Massachusetts took place March 15, 1820, when she was admitted into the Union as an independent state. Ever since the treaty of 1783 a dispute had existed between the government of the United States and Great Britain as to the proper interpretation of that treaty so far as it related to the boundary between Maine and the British possessions. This controversy was finally settled by the treaty of Washington in 1842, by which Maine and the United States agreed to cede to Great Britain a small portion of the territory claimed by her, in return for the concession of Rouse's Point and the free navigation of the river St. John. The enterprise of founding a Swedish colony in Aroostook, begun in 1870, has proved successful. The place selected is called New Sweden, where in 1873 about 600 Swedes aided by the state had settled upon 20,000 acres of land. The colonists have their own municipal organization and schools, in which the chief study is the English language.

MAINE, an ancient province of France, and with Perche one of the great military governments of the kingdom, bounded N. by Normandy, E. by Perche and Orléanais, S. by Touraine and Anjou, and W. by Brittany. It is now almost entirely included in the departments of Mayenne and Sarthe. Its capital was Le Mans. Under the Carolingian and early Capetian kings the province was governed by counts; it was subsequently in turn united with Normandy and Anjou, became subject to the kings of England, was wrested from John by Philip Augustus, and after various transfers was united with the crown of France in 1481.

MAINE, Sir Henry James Sunner, an English jurist, born in 1822. He graduated at Pembroke college, Cambridge, in 1844, and was regius professor of civil law at Cambridge from 1847 to 1854, when he became reader on jurisprudence in the Middle Temple. From 1862 to 1869 he was a law member of the government in India, where he introduced several legislative reforms. In 1870 he was appointed to the newly instituted Corpus professorship of jurisprudence in Oxford university, and in 1871 a member of the council for India. He has published "Roman Law and Legal Education," in "Cambridge Essays" (1856); "Ancient Law: its Connection with the Early History of Society" (5vo, 1861; 5th ed., 1874; reprinted, with an introduction by Prof. T. W. Dwight, New York, 1864); and "Village Communities in the East and West" (1871; 2d ed., 1874), being six Oxford lectures, giving the results of his observations in India, where he had studied the working in village communities of social organisms supposed to correspond with the earliest rudiments of European civilization.

MAINE-ET-LOIRE, a N.W. department of France, comprising most of the former province of Anjou, bordering on Mayenne, Sarthe, Indre-et-Loire, Vienne, Deux-Sèvres, La Ven-
dés, and Loire-Inférieure; area, 2,750 sq. m.; pop., in 1872, 5,18,471. It belongs to the basin of the Loire, by which it is annually inundated; the other principal rivers are the Maine, Loir, Sarthe, Mayenne, and Oudon. The surface is almost level, with slight undulations, and the soil very fertile, producing grain, wine, and fruits. Iron is found, and slate quarries are extensively worked. It has excellent breeds of cattle and horses. The principal manufactures are of linen, especially table linen and handkerchiefs, flannels, and cotton. It has a considerable trade in grain, wine, brandy, and cattle. It is divided into the arrondissements of Angers, Baugé, Chloé, Saumur, and Segré. Capital, Angers.

MAINE DE BIRAN, François Pierre Gouthier, a French metaphysician, born at Gratetou, near Bergerac, Nov. 29, 1706, died in Paris, July 16, 1824. He entered the body-guard of Louis XVI. in 1784, and was at Versailles during the tumults of Oct. 5 and 6, 1789, but lived in retirement during the revolution. In 1797 he was chosen to the council of 500, from which he was excluded on suspicion of royalism, and under the empire became sub-prefect of the department of Dordogne at Bergerac, and a member of the legislative body. In 1813 he was one of the commission appointed to draw up an address to the emperor, which for the first time manifested a decided opposition to his policy. After the restoration he was re-elected to the chamber of deputies, became a councillor of state in 1816, and from 1818 retained his seat in the legislature, in which he constantly maintained the prerogatives of the crown. In a memoir entitled Influence de l'habitude sur la faculté de penser, which obtained the prize of the institute in 1803, he prepared for his departure from the reigning philosophy of Condillac by maintaining a distinction between active and passive mental habits, according to which the mind is active in perception and passive in mere sensation. In his second memoir, Sur la décomposition de la pensée (1805), he abandoned the effort to give a physiological origin to thought, suggested that sensation could not furnish the active and motive element in man, and was disposed to admit a principle of intelligence distinct from the organism. This work was rapidly followed by others, the most important of which was the Examen des leçons de M. de Laromiguière (1817), in which he completely passes from sensational to spiritual philosophy, and develops his own system, which caused Boyer-Collard to say of him: "He is the master of us all." A complete edition of his works was edited by Cousin (4 vols., Paris, 1841).—See Naville, Maine de Biran, sa vie et ses pensées (Paris, 1857).

MAINTENON, Françoise d'Aubigné, marchioness de, second wife of Louis XIV. of France, born in Niort, Nov. 27, 1635, died at St. Cyr, April 15, 1719. She was the daughter of Constant d'Aubigné and Jeanne de Cardillac, and grand-daughter of Théodore Agrippa d'Aubigné, the Huguenot historian of his time, and the friend and companion of Henry IV. Constant d'Aubigné, after dissipating his fortune, formed a project for establishing himself in the Carolinas. His correspondence on this subject with the English government was discovered and treated as treason, and he was imprisoned in the château Troupette at Bordeaux, of which his father-in-law was the keeper. After the death of the latter he was removed to the condergerie of Niort, his wife voluntarily sharing his imprisonment, and there Françoise was born. In 1639 Constant d'Aubigné was discharged from prison, and with his wife and children emigrated to Martinique, where for a while he prospered; but he gambled away what he acquired, and died in 1645 in complete poverty. His widow with her children returned to France, and Françoise was confided to the care of her father's sister, Mme. de Villette, a Calvinist, who trained her in the principles of the Protestant faith. Mme. d'Aubigné, alarmed at her daughter's refusal to attend mass, procured an order restoring the girl to her own custody, and placed her as an inmate, in a dependent and almost menial position, in the house of her godmother, the countess de Neullant, who after a while, and with some difficulty, converted her from Calvinism to Catholicism. The comic poet Scarron, who was paralytic and a cripple, lived in the same street with the countess de Neullant, became interested in the young, beautiful, and intelligent girl, whose adventures had been related to him, and offered money to enable her to enter a convent, which poverty had hitherto prevented her from doing. Françoise refused the offer, and shortly afterward the countess de Neullant placed her in an Ursuline convent, permitting her occasionally to visit her house, where she often met Scarron. Two years afterward, at the age of 16, she was without a home, her mother was dead, and she consented to become the wife of the deformed Scarron, to whom she was married in June, 1652. She was at this time exceedingly beautiful, graceful, and witty, and the house of Scarron soon became the resort of the most brilliant intellects of Paris. Scarron died in October, 1660, leaving his young widow nearly penniless, his pension ceasing at his death. Mme. Scarron petitioned for the reversion of her husband's pension, with small hope of success till Mme. de Montespan, the king's mistress, hearing of her distress, interfered in her behalf, procured her an annual allowance of 2,000 francs, and in 1669 made her the governess of the children she had had by Louis XIV., much to the dissatisfaction of the king, who at first did not like the extreme gravity and reserve of the young widow. Her talents and wisdom, however, soon attracted his attention, and she became his confidant and adviser, was made a marchioness, and took the name of Maintenon from an estate at Versailles which the king purchased.

MAINTENON, Françoise d'Aubigné, Marchioness de, second wife of Louis XIV. of France, born in Niort, Nov. 27, 1635, died at St. Cyr, April 15, 1719. She was the daughter of Constant d'Aubigné and Jeanne de Cardillac, and grand-

daughter of Théodore Agrippa d'Aubigné, the Huguenot historian of his time, and the friend and companion of Henry IV. Constant d'Aubigné, after dissipating his fortune, formed a project for establishing himself in the Carolinas. His correspondence on this subject with the English government was discovered and treated as treason, and he was imprisoned in the château Troupette at Bordeaux, of which his father-in-law was the keeper. After the death of the latter he was removed to the condergerie of Niort, his wife voluntarily sharing his imprisonment, and there Françoise was born. In 1639 Constant d'Aubigné was discharged from prison, and with his wife and children emigrated to Martinique, where for a while he prospered; but he gambled away what he acquired, and died in 1645 in complete poverty. His widow with her children returned to France, and Françoise was confided to the care of her father's sister, Mme. de Villette, a Calvinist, who trained her in the principles of the Protestant faith. Mme. d'Aubigné, alarmed at her daughter's refusal to attend mass, procured an order restoring the girl to her own custody, and placed her as an inmate, in a dependent and almost menial position, in the house of her godmother, the countess de Neullant, who after a while, and with some difficulty, converted her from Calvinism to Catholicism. The comic poet Scarron, who was paralytic and a cripple, lived in the same street with the countess de Neullant, became interested in the young, beautiful, and intelligent girl, whose adventures had been related to him, and offered money to enable her to enter a convent, which poverty had hitherto prevented her from doing. Françoise refused the offer, and shortly afterward the countess de Neullant placed her in an Ursuline convent, permitting her occasionally to visit her house, where she often met Scarron. Two years afterward, at the age of 16, she was without a home, her mother was dead, and she consented to become the wife of the deformed Scarron, to whom she was married in June, 1652. She was at this time exceedingly beautiful, graceful, and witty, and the house of Scarron soon became the resort of the most brilliant intellects of Paris. Scarron died in October, 1660, leaving his young widow nearly penniless, his pension ceasing at his death. Mme. Scarron petitioned for the reversion of her husband's pension, with small hope of success till Mme. de Montespan, the king's mistress, hearing of her distress, interfered in her behalf, procured her an annual allowance of 2,000 francs, and in 1669 made her the governess of the children she had had by Louis XIV., much to the dissatisfaction of the king, who at first did not like the extreme gravity and reserve of the young widow. Her talents and wisdom, however, soon attracted his attention, and she became his confidant and adviser, was made a marchioness, and took the name of Maintenon from an estate at Versailles which the king purchased.
for her. In 1680 she was appointed second lady in waiting to the dauphiness, and she influenced that princess to assist in bringing about a permanent separation between the king and Mme. de Montespan. The queen became much attached to Mme. de Maintenon, and died in her arms, July 30, 1683. Some time afterward the king, who had long and vainly solicited her to become his mistress, was secretly married to her at midnight in one of the cabinets at Versailles, Père la Chaise, the king's confessor, performing the ceremony, in the presence of Harlay, archbishop of Paris, Bontems, governor of Versailles, Louvois, and Montesquieu, as witnesses. From this time till his death Louis was greatly under her influence, though her power over him was exercised with extreme prudence and moderation. She carefully shunned the appearance of meddling with the affairs of state, though in reality nothing was done without her knowledge and consent.

It was at her instigation that the edict of Nantes was revoked and the Protestants persecuted. After the death of the king, in 1715, she retired to the convent and seminary of St. Cyr, which she had founded, and spent the rest of her life in acts of charity and in devotional exercises, which from earliest youth she had been accustomed scrupulously to observe.—See Madame de Maintenon peinte par elle-même (Paris, 1829), which contains her letters, and Histoire de Mme. de Maintenon, by the duke de Noailles (2 vols., Paris, 1848).

MAITRE. See MERTZ.

MAIPRES, or MAIPARES, Indians of South America, chiefly on the upper Orinoco and negro rivers. The family includes the Caveros or Cabrers, who were nearly annihilated by the Caribs; the Guayambinis, who under their chiefs Macapu and Cuseno stemmed the progress of the Caribs and made themselves masters of the upper Orinoco; the Pareni; the Malipares proper, among whom Gili laborde and wrote, and who are now greatly reduced; the Moxos, who extended into Peru and Bolivia; the Mequepure in Brazilian Guiana; the Kirripa; and the Achaguas, a remote branch, residing on the Meta. These tribes were almost all cannibals and engaged in constant wars. The Moxos or Muxus were conquered by the inca Yupanqui, and were thus to some extent brought within the influence of Peruvian civilization. They were the only tribe among whom Christian missionaries won any extensive conquests, though not without great sacrifices. In 1742, before their destruction by the Portuguese, the Moxo missions contained 50,000 neophytes. A grammar, vocabulary, and catechism of the Moxo, by Father Pedro Marban, were published at Lima in 1701; and a grammar of the Bauru, a Moxo dialect, by Antonio Meglo, is still extant.

MAISONNEUVE, Jules Germain François, a French surgeon, who has been called the "Paracelsus of surgery," born in Nantes in 1810. He completed his studies in Paris, where he took his degree in 1835, and became prosecutor, lec-
MAISTRE

revolutionary party in France, among which his
described in the greatest circulation. Notwithstanding the
nerous, the object of which was to show that God is the immediate source of all
and every attack upon religion is a prelude to the destruction of social
A translation of a work of Plutarch, *Sur les détails de la justice divine dans la punition des coupables,* with notes, appeared at Lyons in 1816. His most celebrated work is *Du pape* (Lyons, 1819). It treats of the pope from four points of view: 1, in his relation to the Catholic church; 2, to temporal sovereignties; 3, to the civilization and happiness of the nations; 4, to the schismatic churches. It is considered as one of the standard Catholic works in favor of the infallibility of the pope, which it infers from the necessity of an infallible authority in the spiritual order. Infallibility in the spiritual order is declared to be synonymous with sovereignty in the temporal order. From the same standpoint he attacked the Gallicans in the work *De l'Eglise gallicane dans son rapport avec le souverain pontife, pour servir de suite à l'ouvrage intitulé: Du pape* (Lyons, 1821). Among his other works are the *Soirées de St. Pétersbourg,* ou *Entretiens sur le gouvernement temporal de la providence* (2 vols., Paris, 1821), in which the justness of war and capital punishment is strongly advocated, and *Lettre d'un gentilhomme russe sur l'inquisition espagnole* (Paris, 1822).

In his posthumous *Examen de la philosophie de Bacon* (Paris, 1836) he deprecates the English philosopher, and disparages critical philosophy in general. A very lively discussion was called forth by the publication of another posthumous work, *Mémoires politiques et correspondance diplomatique de Joseph de Maistre, avec explications et commentaires historiques,* by Albert Blanc (2 vols., Paris, 1858–60), many passages in which seemed not fully to agree with his other writings. De Maistre's son Rodolphe published *Quatre chapitres inédits sur la Russie, par le comte J. de Maistre* (Paris, 1859).

H. Xavier, count de, a miscellaneous author, brother of the preceding, born in Cambré in October, 1764, died in St. Petersburg, June 13, 1862. In early life he entered the military service of Sardinia, but upon the conquest of the country by the French he emigrated to Russia, and supported himself for some time by his pen. After the arrival of his brother as ambassador in St. Petersburg, he was appointed in 1805 director of the library and museum of the admiralty. He soon afterward entered the Russian army as lieutenant colonel, and participated in the war against Persia, in which he obtained the rank of major general. He subsequently established himself in St. Petersburg, and devoted the remainder of his life to literary and scientific pursuits. In 1794, being known then as a chemist and as a landscape painter, he published at Turin an ingenious philosophical trile, entitled *Voyage autour de ma chambre,* which had great popularity, and of which numerous imitations of various degrees of merit subsequently appeared. In 1811 appeared *Les libéres de la vallée d'Aoste* (translated into English, Philadelphia, 1825), a work founded on fact, and not less creditable to the author's literary capacity than to his humanity. It was followed by the *Prisonniers du Caucaus,* and *Praesoria,* ou *la jeune Siberienne* (translated into English, Philadelphia, 1826), both containing vivid and truthful pictures of scenery and manners in the eastern and southern provinces of the Russian empire. His popular *Voyage* was followed by *Expedition nocturne autour de ma chambre* (1826). An edition of his works was published at Paris in 1822, in 3 vols. 18mo.

MAITLAND, East and West, two contiguous towns of New South Wales, Australia, on the Hunter river, 75 m. N. of Sydney; pop. in 1871, 13,642, of whom about 2,000 belong to East Maitland. The surrounding region is among the most productive of the globe, and is commonly called the granary of New South Wales. Maitland is the seat of a Roman Catholic bishop, and there are numerous places of worship of nearly all religious denominations. East Maitland has a court house and a jail; West Maitland has many large stores and some good hotels. Two newspapers are published, one of which, "The Maitland Mercury," is the oldest provincial journal in the colony. There is daily communication by railway to Newcastle, and by steamboat thence to Sydney.

MAITLAND, Sir Richard, of Lethington, a Scottish lawyer and poet, born in 1496, died March 20, 1586. He was educated at St. Andrews and in Paris, became an advocate, held several public offices, among others that of lord privy seal, and was knighted. He was the author of a "History and Chronicle of the House of Seaton," and of several poems, the most important of which is that on "The Creation and Paradise Lost." A complete edition of his poems was first published by the Maitland club in 1830. He is celebrated as a collector of ancient Scottish poetry. His collections are yet extant in manuscript in the Pepsian library, Cambridge, and fill two large volumes. He became blind in 1559.

MAITLAND, Samuel Rolfe, an English clergyman, born in London in 1792, died at Lambeth palace, London, Jan. 13, 1866. He graduated at Trinity college, Cambridge, studied law, and was called to the bar at the Inner Temple. He afterward studied theology, took orders in 1821, and became perpetual curate of Christ's church, Gloucester. He resigned this charge in 1830, and thereafter turned his special attention to literature. In 1888 he was appointed librarian to Dr. Howley, archbishop of Canterbury, and keeper of the Lambeth manu-
scripts, which office he held till the death of the archbishop in 1848. He was for several years editor of the "British Magazine," to which he contributed a large number of valuable essays and dissertations, chiefly on subjects of prophecy and its right interpretation, church history, criticism, &c. His principal works are: "An Inquiry into the Grounds on which the Prophetic Period of Daniel and St. John has been supposed to consist of 1260 years" (1826); "Letters on the Voluntary System" (1837); "The Dark Ages, being a series of Essays intended to illustrate the state of Religion and Literature in the 9th, 10th, 11th, and 12th Centuries" (1844; 3d ed., 1853); "Essays on the Reformation in England" (1849); and "Eruvin, or Miscellaneous Essays on Subjects connected with the Nature, History, and Destiny of Man" (1850). He also prepared an "Index of such English Books printed before the year MDC. as are now in the Archepiscopal Library at Lambeth," which was printed, but not published.

MAIZE, or Indian Corn (Zea mays), a valuable grass of the tribe of phalaris. The stems, unlike those of most grasses, are solid, with well defined nodes, and often producing from the lower nodes aërial or prop roots, some of which reach the soil; on the portion of the stem between the nodes is a broad shallow channel upon alternate sides; the stem is simple above, but often produces branches, or suckers, from the lower joints. The long linear-lanceolate leaves are flat, pointed, pubescent above, and with a broad midrib channelled on the upper side; sheaths smooth, downy on the margins, with a short ligule. The inflorescence is monoeious, the staminate flowers in clustered spikes at the summit of the stem, forming what is called the tassel; the spikelets are two-flowered, each floret having three stamens; the pistillate flowers are in dense spikes crowded upon a rachis, the cob; these are enveloped by the sheaths of altered leaves, the husks; the whole pistillate spike is called the ear, and appears at the axis of the leaves; each pistillate spikelet is two-flowered with one flower abortive; when the grain is ripe the withered glumes, abortive flower, and palets remain upon the cob as the chaff; the ovary is terminated by a long hair-like style, which projects beyond the husks, and is usually blid at the extremity; these styles together are the silk; after fertilisation the ovary enlarges to form the grain and the styles wither; the grain is usually flattened by crowding, wedge-shaped or round-kidney-shaped, with a shallow groove containing the embryo. In the different varieties from one to four pistillate spikes or ears are borne by each stalk, though rarely more than two, and the number of rows of kernels varies from 8 to 12 or more, but they are always in even numbers. It is not rare to find abnormal specimens in which pistillate flowers are borne upon the tassel, where they perfect their grain, and the ear is terminated by the cob; a few rows of sterile flowers appear, but these are always prostrate and furnished with staminate flowers. The maize plant is affected in a remarkable degree by climate and soil; it soon adapts itself to a locality, and by continuous cultivation from the same seed year after year, a local variety or strain becomes established. Though all the kinds of maize in cultivation, at least in the United States, are regarded as of one species, the varieties are almost endless; these are produced not only by local influences, but by selection; it is one of the species in which any peculiarity may be readily fixed in a few years by carefully selecting and sowing seeds from those plants which have the desirable features most strongly marked. In respect to size, there are varieties from 2 or 3 ft. high up to 15 and 18 ft., with the stalks and leaves large in proportion; the ears vary greatly in size and number of rows of kernels, which sometimes reach 24, 32, or more. There is a great difference in the form and size of the grain; a miniature kind, known as Brazilian, has ears about the size of one's little finger, with grains not larger than a mustard seed; while at the other extreme are the large southern varieties with kernels half an inch long. In the variety called rice pop-corn the kernels are pointed at both ends and but little compressed, and in the dent varieties there is a distinct depression at the upper end of the grain; in some the grains have a sharp hook at the end. In one variety, which has been described by Bonafous as a distinct species, Z. cryptoperma, the floral envelopes of the pistillate flowers, instead of being as is ordinarily the case in a rudimentary or imperfect condition, are fully developed, and enclose the grain when ripe in a miniature husk; this variety has been considered as the primitive type, but it is said to lose its husky envelopes in cultivation; neither this nor any other form of maize has been found in the wild state. The grains of maize present a great variety in color, from
white through various shades of yellow to orange, red, brown, violet, purple, and black; by the crossing of varieties kernels of two or more colors in stripes and blotches are produced. In the Tucumcari and some others the grain is dull and opaque, while in the so-called flint varieties the mass of the grain, the albumen, is translucent; the opaque kinds are very starchy, while the others contain large proportions of fatty matter. In the varieties known as sweet corn the grain is very much wrinkled and shrivelled; in these the conversion of sugar into starch is arrested, and the kernel does not fill out. A well developed stalk of maize is a most beautiful object; it has a state- uly sub-tropical aspect, and were it not so common it would be prized with us, as it is in some parts of Europe, as an ornamental plant. A few years ago Mr. Thomas Hogg sent from Japan a very distinct variety (if not species), in which the leaves are finely striped with white, and when young often with a tinge of red; the plant is only about 4 ft. high, but is very leafy, and retains its markings all through the season; it at once became popular in England, but is less frequently seen in our gardens than its merits deserve.—Some writers, including Bonaparte (Histoire naturelle du maïs, Paris, 1836), have attributed an eastern origin to maize, and the subject has been the occasion of much discussion; the matter has been thoroughly examined by Alphonse de Candolle (Geographie botanique raisonnée, Paris, 1850), who sums up thus: “Maize is of American origin, and was not introduced into the old world until after the discovery of the new.” It was found in cultivation by the aborigines from New England to Chili; varieties not now in cultivation in Peru have been found in tombs of an antiquity greater than that of the Incas; and Darwin (‘Geological Observations on South America,” London, 1846) discovered “heads of maize, together with 18 species of recent sea shells, imbedded in a beach which had been upraised at least 85 ft. above the level of the sea.”—It is estimated that maize is eaten by a greater number of human beings than any other grain except rice; its analysis shows it to be admirably adapted to sustain life, and to furnish materials for the growth of both human beings and domestic animals. Recent analyses show the following percentage of nutritive principles: albuminoids (flesh-forming materials), 10 per cent.; carbohydrates (starch, sugar, &c.), 68; fat, 7. The amount of ash is a little over 2 per cent., and this contains a large proportion of phosphoric acid in combination with lime and other bases. The amount of fatty matter or oil is noticable, varying with the kind of corn from 6 to 11 per cent.; the hard flinty varieties of northern localities have the most, and the starchy kinds the least; wheat contains only about 14 per cent. of fatty matter. It will be seen that maize is a highly concentrated nutrient, and is capable of serving, as it does in some tropi- cal countries, as almost the sole food of the population; it is more difficult of digestion than some other grains, and where, as in Central and South America, it is the chief food of the common people, they almost invariably accompany it with capiscum, in the form of chili colorado or chili verde, as a stimulus to the stomach. While maize furnishes a large share of the breadstuff of our farming population, it is but little consumed in cities, except to give variety upon the table; but indirectly it largely contributes to the support of city populations in the way of meats, poultry, butter, &c. In the unripe state maize in the form of “green corn” is a generally esteemed vegetable, and the quantities daily supplied during the season to cities are enormous; the varieties already alluded to as sweet corn are in the northern states raised exclusively for eating in the green state; the ears are plucked while the contents of the kernels are still milky. A large business is done in preserving this kind of corn in tin cans for use when it cannot be had fresh, and large quantities are dried, being first boiled and then cut from the cob. The favorite dish called succotash consists of unripe beans and green corn cooked together, and in winter it is made from ripe beans and dried sweet corn. One of the primitive methods of preparing the ripe grain for food is to soak it in lye from wood ashes to remove the pericarp or hull; the grain in this process becomes softened, and after washing to remove the lye it is crushed into a paste upon an inclined stone by rubbing it with a smaller long and narrow stone; the resulting dough is then patted into thin cakes and quickly baked upon a tile or iron plate; these cakes are the tortillas of the Mexicans and other Spanish Americans, and it is probable that this method of preparing corn is of great antiquity, as the metatl, or stone for grinding, is found among ruins so old that all tradition respecting them is lost. Another simple method of preparing corn in use by the Mexicans is as pinole; the grain is roasted, then ground to a coarse meal, which is mixed with sugar and spices; this is stirred with water to form a sort of gruel, and, the grain being already cooked, it is very nutritious; pinole is often the sole provision carried by travellers on long journeys, and forms an important part of the rations of the soldiers. The hull may be removed from the grain by beating; this is done by hand in a wooden mortar, or on a large scale by machinery; corn thus prepared is called hominy and is in the northern states used as the whole decorticated grain, and hominy which is broken or coarsely ground, a distinction not made at the south; these preparations of corn are cooked by boiling. Husked corn is the grain from which the hull has been removed by the use of lye, then thoroughly soaked, and afterward boiled until tender. In the form of meal maize is largely
consumed, it being made into a great variety of bread and cakes, conspicuous among which is the New England brown bread, in which rye meal is mixed with the corn meal in the proportion of one third. Hasty pudding, the praises of which were celebrated in verse by Barlow, is a mush or stirabout of Indian meal and water; this, eaten with milk, is an exceedingly cheap and nutritive food. In some localities only the flinty kinds of corn are used for meal, while in others the starchy varieties are preferred. Several varieties are known as pop-corn, of which there are white and yellow kinds, those with kernels pointed at the end, and others with the grain of the ordinary shape; when gradually exposed to heat over a brisk fire, the oil in the grain becomes converted into gas, which at length ruptures the grain, causing a singular inversion of its contents; the corn thus popped is many times larger than the original grain, and snowy white; as an article of food it is much prized by children and others, and the preparation of it is one of the small industries which in the aggregate amount to a respectable sum. Corn is sometimes used as fuel; upon prairie farms where there is no wood, and at long distances from a market where corn can be sold and coal bought, it becomes the cheapest obtainable fuel; the cobs after the corn has been shelled from them are in general use as fuel, and farmers prefer them to any other to burn in smoke houses, as they think meat thus cured is better flavored than if wood is used; a pipe with a bowl made from a corn cob is a favorite with many smokers. Besides the uses of the grain, the stalks and leaves are of great value as cattle fodder; the old plan was to top the corn when the grain began to ripen by cutting off the stalk above the upper ear, and to strip off the leaves from the rest, and this is still done by some old-fashioned cultivators; the improved method is to cut up the stalks at the ground as soon as the grain begins to harden, or is "glazed," tie them in bundles, and set these up in the field in large stocks; treated in this way, the corn ripens thoroughly, and all the fodder is saved in a clean condition. Corn stalks are cut for feeding, and if cut and steamed they are considered equal in value to the common kinds of hay; one ton of stalks is yielded on the average for every 25 bushels of grain. Corn is often sown for the sake of a crop of fodder only; in this case no regard is had to the grain, and the seed is sown thickly and the corn allowed to stand close in order to produce a more succulent crop; it is cut as soon as the tassels open, and cured in small bundles. Large quantities of corn are grown in this manner to be used as green forage; the plant flourishes best in the hot summer months, the time when pastures begin to fail. On dairy farms a field of fodder corn is of great importance in keeping up the supply of food; the stalks are cut and fed to the animals in their stalls.—Among the miscellaneous uses which the maize plant has served is the manufacture of paper; an Austrian, Von Welsbach, invented a process by which the fibre of the stalks, leaves, and husks could be converted into paper; a few years ago specimens of various grades, from the coarsest to the finest papers, were exhibited in this country, but the manufacture does not appear to have extended. The juice of the stalk before the grain ripens is appreciably sweet, and both sirup and sugar have been obtained from it; the process of clarifying appears to be a difficult one, and for sirup the maize cannot compete with sorghum. The starch of the grain is converted into grape sugar, which in the form of a thick honey-like sirup is used by brewers and wine makers. As with all other forms of starch, that of maize, being capable of conversion into sugar, is by one more step capable of producing alcohol, and whiskey must be mentioned as one of the incidental products of the corn crop. The starch of maize when examined with the microscope is found to be of irregular grains with many sides, the result of mutual compression, having a distinct hilum; the grains are only about one fourth as large as those of potato starch. Corn starch carefully prepared is much used in delicate cookery for puddings and the like; a similar preparation is largely sold under the name of "maizena." The oil furnished by corn has been found excellent for illuminating purposes, but on account of the expense of extracting it is not likely to come into general use. The husks, or slunks as they are called in some localities, are put to many domestic uses; slit into shreds they are used for filling mattresses, both by farmers and upholsterers; large quantities are prepared at factories in the southern cities, and they form a large part of our commerce; by selecting the more delicate inner ones and plaiting them, table mats and other fancy articles, and even bonnets and slippers, have been made from them; coarser ones are braided to form door mats, horse collars, and other wares.—In America corn is cultivated from lat. 54° N. to 40° S., and in the eastern hemisphere from the Azores to southeastern Europe, some being raised in Asia Minor, Egypt, India, and China. The early colonists of this country soon learned its uses and manner of cultivation from the Indians; large crops were raised on the James river as early as 1608, and it has continued to be one of the most important of our agricultural products. In the older states it is a question with agriculturists whether corn is a profitable crop to raise simply for the grain; upon poor lands it requires abundant manuring, and clean cultivation is essential to its success. In a rotation it is of great value as a cleansing crop; i. e., the cultivation it demands leaves the land in excellent condition for whatever crop is to follow. Upon the rich lands of some of the western states the grain can be raised at a surprisingly low cost; the great fertility of the soil allows crops to be taken year after year without manure, and every mechanical appli-
The husks, where it revels upon the tender kernels. The most serious enemy to the crop is not an insect but a fungus, *vestilago maydis*, which produces what is known as smut; it manifests itself by abnormal growths upon various parts of the plant, but more frequently it attacks the growing grain; a single kernel will sometimes be found transformed into a soft grayish fungoid mass, as large as an egg or larger; this when broken open will be found to contain a blackish powder, the spores. This is not only destructive to the corn, but dangerous to the animals which eat it; the death of animals has been directly traced to feeding on corn stalks badly affected with smut, and it is said that mules fed upon corn thus diseased lose their hoofs, and that it produces abortion upon cows; it seems to have properties similar to those of the ergot of rye.—According to the federal census, the United States produced 592,071,104 bushels of Indian corn in 1860, 788,792,742 in 1860, and 760,944,549 in 1870. The states which produced more than 14,000,000 bushels in 1870 are as follows:

During the year ending June 30, 1873, 88,541,930 bushels of Indian corn, valued at $23,794,694, were exported from the United States, chiefly to Great Britain, besides 408,111 bushels of meal, worth $1,474,827. In 1872 the total import of Indian corn into Great Britain, chiefly from the United States, amounted to 24,583,670 cwts., valued at $8,691,192. For a full discussion of the origin of maize, see De Candolle, *Géographie botanique*, quoted above. A description of the leading varieties is given in Fearing Burr, jr.'s "Field and Garden Vegetables of America" (Boston, 1865). A full and exhaustive treatise is Edward Engfield's "Indian Corn, its Value, Culture, and Uses" (New York, 1866).

**MAJESTY**, a title of the highest honor, first used by the Romans to designate the supreme power and dignity of the people (*majestas populi Romani*), as well as of its highest chosen representatives or rulers, as dictators, consuls, and the senate. On the overthrow of the republic, the emperors assumed the same title (*majestas Augusti*), and in the middle ages it was adopted by the German emperors. Of kings, it was given to Louis XI. of France in 1461, and Henry VIII. of England assumed it in 1520. When Charles V. was elected emperor of Germany in 1519, he took the title also as king of Spain. It is now generally bestowed on all emperors and kings of Europe, except the sultan, who is styled highness, as well as on the emperor of Brazil. The emperor of Austria is addressed as imperial and royal apostolical majesty. The titles of Catholic majesty and most Christian majesty were bestowed by the see of Rome on the kings of Spain and France respectively. James I. of England used the style "sacred" and "most excellent majesty." Violations of the majesty
of the people, as for instance treason, were termed by the Romans criminia lexoe majestatis, a term also used of violations of monarchical dignity.

MAJORANO, Gaetano. See CAFFARELLI.

MAJORCA (Span. Mallorca), the largest of the Balearic islands, in the Mediterranean, belonging to Spain, about 120 m. S. S. E. of Barcelona, between lat. 39° 13' and 40° N., and long. 2° 20' and 3° 30' E.; length from E. to W. nearly 64 m., breadth in some parts 40 m.; area, about 1,300 sq. m.; pop. about 230,000. On the N. E. coast are the large bays of Puerto Mayor and Puerto Menor, and on the S. E. that of Palma; and there are several good natural harbors. The northern half of the island is covered by mountains, the highest of which is upward of 5,000 ft. above the sea. The southern half is comparatively level. The rocks are generally of secondary or tertiary formation. There are five or six small rivers, and the hills and plains generally are well supplied with small streams, though in some of the plains the want of water makes cultivation difficult. The principal river, the Riera, rises at the foot of Mount Puigpomente and falls into the sea at Palma. The climate is temperate, the thermometer in summer ranging only from 84° to 88°, while that of winter seldom falls below 48°. The island produces marbles of great beauty and variety, 86 different specimens of which were exhibited at Vienna in 1873, and also slate, granite, syenite, porphyry, and some coal and iron. Lavender, rosemary, thyme, marjoram, saffron, marsh mallow, jonquil, and wild celery are the commonest vegetable productions. The island affords abundant pasturage for large numbers of horses, mules, cattle, sheep, goats, and swine. The sheep are large, and produce great quantities of fine wool. Game of the smaller kind, such as hares, rabbits, quails, and partridges, is very plentiful; and the preserving of thrushes as well as of fish is an important industry. There are scarcely any venomous animals. The soil is exceedingly fertile, but the agricultural skill of the islanders is imperfect. Wheat, barley, oats, hemp, flax, and silk are produced in considerable abundance, and the fruits include oranges, lemons, citrons, dates, figs, and pomegranates. The olive crop yields yearly 650,000 gallons of oil. The people manufacture a considerable quantity of woolen stuffs, not only for their own use, but for export to Spain, Malta, Sardinia, and America. Other important manufactures are hats and fine cabinet ware. New factories have recently been constructed for the production on a large scale of canvas, rope, and cordage, fibre for which is now imported from Manila; the Spanish navy was lately supplied entirely with rope made at Palma. The island, which in earlier days gave its name to majolica ware, now only produces very common pottery. The wines are excellent, and are largely exported, as are also brandy, oil, figs, and oranges. The total value of the exports in 1873, including the coasting trade, was $6,076,339. The principal towns are Palma, Soller, Manacor, Alcudia, Porreras, and Inca. Palma is the capital, the seat of a bishop and of the captaincy general of the Balearic islands. A railway to connect it with Inca and Alcudia is in progress. The natives resemble the Catalans in their appearance and manners, are remarkably honest and hospitable, and make excellent soldiers. The upper classes speak Castilian, but the lower orders use a dialect which is a mixture of Greek, Latin, Vandal, Arabic, Catalan, and Languedocian words, representing the various races by which the island has been occupied.—Little is known of the early history of Majorca. There were Carthaginian settlements in it prior to 500 B. C. The Roman C. Metellus conquered it A. D. 128, and the Vandals in 426. The Moors seized it in 708, and held it till 1299, when it was taken by James L. of Aragon, who erected it into a kingdom (including the other Balearic islands, the county of Montpellier, Roussillon, and Cerdagne) in favor of his son Don James, in 1292. It was finally annexed to Aragon in 1434. The island declared for Charles III. in the war of the Spanish succession; it rebelled against Philip V. in 1714, but submitted in July, 1715. It was thrice visited by epidemics—in 1805, 1870, and 1873—attended with frightful mortality. (See BALEARIC ISLANDS.)

MAL. See LEMUR.

MALABAR, a district of British India, in the province of Malabar, on the W. coast, between lat. 10° and 12° 20' N.; area, 6,262 sq. m.; pop. in 1871, 2,274,463, of whom about 24,000 were Christians. It is bounded N. by the district of South Canara, S. by Cochin, W. by the Indian ocean, and E. by the Western Ghauts, which are here 4,000 ft. and upward in height. Between these and the sea the country lies, extending about 150 m. along the coast, with an average breadth of 40 m. With trifling exceptions, a low sandy strip, from 1 to 3 m. broad, runs along the shore, and is covered with a continuous and luxuriant grove of coconut trees, to the cultivation and care of which the natives give the greatest attention. Behind this tract, hills of inconceivable height come down from the mountain chain which forms the E. boundary. Between these hills there are valleys of extreme fertility, being the receptacle of the soil washed in the course of ages by the heavy rains from the surrounding eminences. The hills have level, or rather perfectly horizontal summits of naked rock, which is a peculiar characteristic of the face of the country. Many of them have steep sides, which are not unfrequently formed into terraces and cultivated. All the country that borders on the Ghauts is covered with forests and dense jungle, belts and detached portions of which in places stretch to within a few miles of the sea. Malabar is watered by innumerable short streams. The chief river is the
MALABAR

47

Beypoor, which is with its tributaries navigable for boats of considerable size for about 50 m. inland, next to this is the Ponnay river, which is longer but shallower. Several inlets run along a short distance from the shore parallel to the coast, receive the mountain streams, and communicate with the ocean by shallow channels, and are navigable for small boats for nearly the whole length of the province. It is on the banks of the rivers and of these inlets, in the valleys, and along the coast, that the inhabitants reside. The climate is generally healthful, though in the interior jungle fever is prevalent at certain seasons. The hot season is from February to May, the wet from May to October, and the cool during the remainder of the year. The thermometer seldom rises above 90° in the shade, and rarely falls below 70°. During the wet season very heavy rain falls along the coast, increasing toward the interior; the average rainfall throughout the district is more than 75 inches per annum, and at Cannore it is 128 inches. —The principal vegetable productions of Malabar are pepper, coconuts, ginger, coffee, hemp, cardamoms, betel nuts, turmeric, arrowroot, sapan wood, sandal wood, timber of different sorts, and various gums and resins. Besides teak, 120 other kinds of valuable timber have been enumerated in a report upon the forests of Malabar. Since 1845 large plantations of teak have been made. Cardamoms are produced from the forest land on the face of the mountains which bound the province, at the height of from 2,000 to 4,000 ft. above the sea, growing spontaneously after the felling and burning of the trees. Pepper, which is the principal commercial product, and is styled the money of Malabar, is chiefly cultivated in the northern part, in the neighborhood of Tellichery, and thrives especially in the moist valleys of the Ghauts. The trailing plant from which it is produced requires but slight care, the cultivator having little more to do than collect the produce. The culture of coffee was introduced by British planters, on estates situated on the slopes of the mountains, some 2,000 ft. above the sea. The proprietary system of land revenue prevails, under which a percentage of the rent goes to the landlords and the rest to the government. Rice is grown throughout the province, but not in sufficient quantities for internal consumption. The cultivation of ginger, since its exportation to Europe began, has been carried on with great vigor. Iron is obtained from laterite in many places, and gold in small quantities is found in the mountain streams. Large herds of elephants and buffaloes frequent the interior forests. There are some tigers and numerous leopards, deer of various kinds, elk, bears, hogs, porcupines, squirrels, and monkeys. There are small bullocks, which, together with buffaloes, are used in tilling the ground: in the level tracts elephants are employed in dragging timber to the rivers, to be floated to the coast. There are but few horses, and traffic is either carried on by water or upon men's shoulders, as in China.

—The population of Malabar is made up of Hindoos, Mohammedans, and Christians. There are a few Jews, both white and black, who are principally settled in the southern part of the district. The Brahmans, the highest class of Hindoos, are here called Namburis; to limit the numbers of their race, they prevent the younger sons from marrying. There is another caste of Brahmans called Patter, who are much more numerous. The next in rank are the Nairs, who are of 11 castes, of various ranks and professions, but all pretend to be born soldiers. Their habits and manners are marked by some strange peculiarities, among which may be mentioned the want of that penurious disposition natural to other Hindoos, and their utter disuse of marriage. A girl on reaching the age of puberty forms any connection she thinks fit; and the children, who have no claim upon their natural father, become the heirs of her brothers. The Tiars, or Thens, are considered next in rank to the Nairs, and are engaged in various occupations, but principally in cultivating the ground. The Poliars, or Cherrams, are a numerous class, who, before the British interfered in their behalf, were held in slavery, and bought and sold separately or along with the land. The Niadis are the lowest specimens of all, and are outcasts considered so impure that even a Cherram would be defiled by their touch. They wander about in companies of 10 or 12, keeping at a little distance from the roads, and upon seeing a traveller set up a cry for assistance. They refuse all labor, subsist upon roots and any food however loathsome, and live in wretched huts built in secluded spots. The Cherrams and Niadis are supposed to be the descendants of the aboriginal inhabitants of the country, and are much smaller in stature and darker in complexion than the Brahmans, Nairs, or Tiars, who are all of good height and well formed, with remarkably handsome features and olive-colored complexion. The native Musulmans, denominated Mapilas, form about one fourth of the population. They are descended from Hindoo mothers by Arab fathers, who settled in Malabar about the 7th or 8th century, and are exceedingly fanatical and treacherous. There are some Syrian Christians toward the S. boundary of the province, who consider themselves descendants of converts made by the apostle St. Thomas in the 1st century (see CHRISTIANS OR ST. THOMAS); and also a few thousand converts to Christianity and descendants of the Portuguese, who reside chiefly in the neighborhood of their ancient settlements.

—The Hindoo population of Malabar are not prone to congregate in towns and villages, but for the most part live in separate houses, neatly built and kept scrupulously clean, throughout the country. The towns of the province, either to foreign settlers, and the chief are Calicut, Palghat, Tellichery, Cannore, Mahé (which is a French colony), and Ponany. At
Beypoor, 7 m. S. of Calicut, where the river of the same name falls into the sea, is the terminus of a railway connecting Madras with the coast of Malabar. The attempts of the English to manufacture iron here have not been successful. Many ships have been built at Beypoor, for the construction of which the forests situated on the banks of the river supply teak timber of a darker color and better description than is found elsewhere, and of very large size. It was at Beypoor, and not at Calicut as generally supposed, that the first European navigator, Vasco da Gama, landed in 1498. At that time the Portuguese established themselves in Malabar, and the Dutch made some settlements there in 1663. The exports of Malabar amount in value to about $3,000,000 per annum. They consist chiefly of coconuts and coconut oil, coir rope, arrack, betel nuts, coarse cotton cloth, pepper, ginger, cardamoms, camphor, coffee, kino, and various gums and resins. The imports do not amount to more than one third of the value of the exports.—

The Malabar is supposed to be a corruption of the Indian Malayatam, signifying skirting the hills, and the original Sanskrit name is said to have been Kevala. It is supposed that the country was conquered in very early times by a king from the opposite side of the mountains, and that the Nairs came at the same time as a military body. They took every opportunity to aggrandize themselves, and continued to rule the country till Hyder Ali invaded it in 1763. Hyder subdued the country, plundered it almost to exhaustion, and expelled all the rajahs except such as conciliated him by immediate submission. His son Tippoo Sahib proposed to the Hindoos to embrace the Mohammmedan faith, and followed up his proposition by levying large contributions on his infidel subjects, and forcibly circumcising many of the Brahmans, Nairs, and others. On the breaking out of the war between Tippoo and the British in 1790, the refractory Nairs, many of whom had fled to the forest to escape his persecution, joined the latter and succeeded in driving him from the country. With some slight disturbances, Malabar has since remained a portion of British India. It was incorporated with the Madras presidency in 1803, and since then the population has more than quadrupled, and the country is steadily advancing.

**MALABAR COAST**, an indefinite term applied to the W. side of the Indian peninsula. In a somewhat restricted sense it means the coasts of Concan, Canara, Malabar proper, Cochin, and Travancore. The coast of Malabar proper is about 150 m. in length, and has numerous harbors, though most of them are so shallow as to be available only to vessels of light draught and coasters.

**MALACCA**. I. A British territory, one of the Straits Settlements, on the W. side of the Malay peninsula, between lat. 2° and 2° 30' N., extending 42 m. along the coast, and varying in breadth inland from 14 to 24 m.; area, 658 sq. m.; pop. in 1870 (estimated), 67,267, of whom 2,448 were white. The territory lies in an irregular triangle, the S. E. boundary or base of which is formed by the Cassang river, which rises near a remarkable conical hill named Mt. Ophir, about 50 m. E. of the capital. In the interior the country is arranged in a series of undulating hills and valleys, generally lying parallel to the seacoast. There are no great ranges of hills, but a large number of detached elevations are found, varying in height from 100 to 1,000 ft. Mt. Ophir, called by the natives Ledang, is the only considerable elevation; it rises to the height of about 5,000 ft. above the level of the sea. The general formation of these hills and of the territory is granite, with a covering of laterite, or red clay ironstone. The coast line may be divided into three portions of distinct character. The N. W. portion, from Lingie river to Tanjong Kling, 17 m., shows a bold wooded elevation reaching to the sea. Beyond this coast plateau the series of hill and valley commences immediately. The central portion, or from Tanjong Kling to the town of Malacca, 5 m., is a sandy beach, with ferruginous rocks, appearing in points jutting into the sea. The third part, 21 m., is a mud flat, exposed for a great distance at low water; and the inner portion is covered with mangrove jungle. Inland from the two latter portions, an immense alluvial plain, with detached hills, extends considerably beyond the inner boundary of the territory. The district is watered by five navigable rivers, of which the Lingio is navigable for vessels of 200 tons as far as Simpang; a distance of 8 m. Numerous smaller streams fall into the sea. The soil of the lowlands is a rich alluvium, varying in color from light brown to red. The territory is capable of producing in perfection almost every article of intertropical culture, and of late years the forests have been cleared away to a considerable extent, and agriculture is on the increase. It enjoys the equable temperature and salubrious climate of the Malay archipelago, to which it geologically and ethnologically belongs. The greatest recorded range of the thermometer is from 68° to 86°. —Tigers, leopards, black panthers, and other ferocious animals abound. Among the other animals are monkeys of various species, the elephant, rhinoceros, buffalo, wild ox, tapir, several species of deer, the antelope, and musk deer. The chief crops are rice, the coconut, and tapioca. Nutmeg plants have been brought from the Moluccas, and cultivated with moderate success. Cinnamon, of superior quality to that of Ceylon, is cultivated for exportation. Cotton, chocolate, sugar cane, indigo, and a great variety of fine fruits are raised. Among the exports are tin, known in commerce as "straits tin," ebony, ivory, rattans, large eagle wood, hides, logs, and fowls. Gold is washed from the sands of all the streams in fine dust. The trade is chiefly with
MALACCA

the neighboring British settlements, Penang and Singapore. The annual exports amount to about $3,000,000, and the imports to about $2,250,000. (See MALAY PENINSULA, and STRAITS SETTLEMENTS.) II. A city, capital of the territory, situated near the mouth of a small river which falls into the straits of Malacca, in lat. 2° 14' N., lon. 109° 12' E.; pop. about 15,000. It was the chief emporium of oriental commerce before Europeans visited the Indian seas. The Arabs, Persians, and Hindoos resorted to its port to procure the spices, guns, and other precious products of the Malay archipelago, which they afterward distributed throughout Asia, Africa, and Europe. It owed its commercial distinction to the freedom of its roadstead from hurricanes or the influence of the monsoons, and to its advantageous situation in the straits of Malacca, the great highway of eastern commerce. It is a free port; but its trade has long ceased to be of any relative importance, and is almost entirely confined to the neighboring settlements. The harbor is too shallow to admit large vessels. When first visited by the Portuguese, it contained about 35,000 dwellings, and, according to the lowest computation made at the time, 150,000 inhabitants. It was besieged and taken by Albuquerque in 1511. The victor captured more than 3,000 pieces of brass and iron cannon, mounted upon the walls of the city, which were said to be superior to any of Portuguese fabrication of that period. The Portuguese held possession of the city for 180 years, and during that period it underwent 19 sieges, 8 of which were undertaken by the Malay, chiefly of the state of Acehn, and the rest by the Dutch. It was captured for the last time, after nine months' siege and blockade in 1641. The Dutch held the city for 154 years, surrendering to a British besieging force in 1795. In 1818 it was restored to the Dutch government; but it again reverted to the British in 1824, in exchange for Bencoolen in Sumatra. There are many notable ruins of fortifications constructed by the ancient Malay kings, and many of their tombs; also ruins of monasteries, churches, and fortifications constructed by Albuquerque, including those of the monastery of Madre de Dios, on a hill in the rear of the town, which contained the remains of St. Francis Xavier till they were transferred to Goa.

MALACCA, Straits of, the waters which separate the Malay peninsula from the island of Sumatra. This channel is the most frequented route of European vessels proceeding eastward to Chinese and neighboring ports; and it is also in the line of Australian and Malayans communication with continental India. It enjoys with the Malaysians an entire exemption from the hurricanes and typhoons which prevail in the neighboring waters to the eastward and westward. Two lighthouses constructed by the British government, at the N. W. and S. E. extremities, contribute greatly to the safety of its navigation. The channel is about 600 m. long, and from 30 to about 290 m. wide.

MALACHI, the last of the minor prophets. The name may be defined either "my messenger" or "messenger of Jehovah." Nothing is known of his person or history, and many interpreters, as Umbreit, Hengstenberg, and others, are of opinion that Malachi is not a proper name, but an official title; and some hold that Ezra was the writer of this book. From the contents of the prophecy it may be inferred that the prophet lived after Zerubbabel, since in his time the second temple was already built (iii. 10), and that he was contemporary with Nehemiah (446 B. C.). The prophet reminds Israel of the kindness of God toward them in the past, and complains of the irreligiosity of the priests and the people. He then announces the coming of a messenger sent by the Lord to prepare the way for him, and the coming of the Lord himself to judgment, which will be condemnation of the wicked and a blessing on the good. The prophecy of Malachi occupies the last place in the canon of the Old Testament, and is referred to in several places of the New Testament. Among the more important commentaries upon it are those of Hitzig, Ewald, Maurer, Umbreit, Pressel, and Reiske. The last, a Roman Catholic, has written the most complete work on this book, containing the Hebrew text and a translation, with a full critical, philological, and historical commentary (Giessen, 1856).

MALACHY, Saint, archbishop of Armagh, born in Armagh about 1095, died at Clairvaux, France, Nov. 2, 1148. He was of noble birth, became a monk, and was appointed vicar of St. Celus, archbishop of Armagh, who destined him for his successor. He studied canon law under St. Malchus, bishop of Lismore, and rebuilt a portion of the monastery of Benchor. About 1127 he was appointed bishop of the united sees of Down and Connor. He visited on foot every hamlet in both dioceses, restored reverence for the matrimonial contract, repaired churches, established schools, obtained enlightened priests, and introduced everywhere the Roman liturgy and ritual. He became archbishop in 1129; as the immoralities of Armagh had been confiscated, he continued to govern the diocese of Connor. This city was sacked in a civil war, and with 120 disciples he retired into Munster, built the monastery of Ibruch, and as primate made a visitation of Munster and Connaught. Toward the end of 1134 he took possession of the see of Armagh, completed his reforms, and made a second visitation of the dioceses of Munster. In 1157 he resigned his archiepiscopate, consecrated a bishop for Connor, and resigned the see of Armagh to himself the poorer and obscurer see of Down, where he founded various institutions. In 1159 he went to Rome, to confer with the pope about
a thorough renovation of the Irish church, and received full power as legate a latere. After his return he visited every part of the island, and in 1148 held a national council at Inis Padraig or Patrick's Holme; disciplinary decrees were enacted, and a petition was drawn up for the establishment of two metropolitan sees. With these Malachy started for France, hoping to meet Pope Eugenius III. at Clairvaux; but he arrived there after the pope's departure, fell ill of a fever, and died in the arms of St. Bernard, who pronounced a panegyric at his funeral, and wrote his life (translated by Maffei). He was canonized by Clement III. in 1190, and his feast is celebrated on Nov. 3.—A "Prophecy concerning the Lives of the future Roman Pontiffs," beginning with Celestine II., elected in 1143, popularly attributed to St. Malachy, is now considered to have originated in the conclave of 1590. It was first published in 1595 by the Benedictine Arnaud de Wyon, and is to be found in Moréri's Dictionnaire historique.  

MALACOLOGY (Gr. μαλακός, soft, and λόγος, discourse), that department of zoology which treats of the molluscs, some of which were termed even by Aristotle malakia (soft animals), including the examination both of the external shells and the internal organs. In the article CONCHOLOGY the outer shells of mollusks have been sufficiently described, and their internal organization and habits will be noticed under MOLLUSCA; it only remains here to enumerate briefly some of the principal systems of classification. Linnaeus (1766) placed mollusks in his 6th and lowest class of vermes, with worms and zoophytes. As early as 1812 Cuvier had given to the world his views on the classification of animals, founded principally upon his researches in comparative anatomy; he makes the molluscs his second branch, with the classes: 1, cephalopoda (like cuttle fishes); 2, pteropoda (like efo or whale bait); 3, gastropoda, with orders pulmonata (slugs and snails), nudibranchia (naked marine genera without shells, like doris), inferobranchia (phyllidia, tectibranchia (bulia and aplinia), heteropoda (carinaria), pectinibranchia (most of the marine univalves, turbo, trochus, &c.), tubulibranchia (like stiluvian, sentibranchia (haliothe, &c.), and cyclobranchia (potella and chiton)); 4, acephala, with orders testacea (oyster, clam, and most bivalve shells) and tuniciata (ascidians); 5, brachiopoda, like terebratula, crania, and lingula; and 6, cirripodita (like barnacles), now placed among articulata in the class crustacea.—Lamarck (1815-22) arranged the molluscs in two classes: one his 11th, conchifera or bivalves, with the orders dimyaria (having two separated muscular impressions on the inside of the shells) and monomyaria (with a nearly central single impression); the other his 12th class, mollusca, with the orders pteropoda, gastropoda, tracheopoda (heliz, &c.), cephalopoda, and heteropoda (carinaria); he placed the ascidians in his 4th class, tunicata, among his apathetic animals; he made of the cirripeds his 10th class, with the orders sessilia and pedunculata, ranking them and the next two classes among sensitive animals. — Ehrenberg (1836), in his division of ganglioneura (with ganglionic nervous system), and subdivision sphygmozoa (with a heart and pulsating vessels), makes his 4th section of mollusca, characterized by absence of articulations to the body and by the irregular dispersed of the nervous ganglia; he gives the classes cephalopoda, pteropoda, gastropoda, acephala, brachiopoda, tunicata (simple ascidians), and aggregata (compound ascidians); the cirripeds he places among crustaceans.—Owen (1843-58), in his "Lectures on Comparative Anatomy," and article "Mollusca" in the "Encyclopaedia Britannica" (8th edition), divides the province mollusca or heterograptiata into two sections, acephala and ecephala, according to the absence or presence of a head and its accompanying parts. I. Acephala, with the classes: 1, tunicata; 2, brachiopoda; 3, lamellibranchiata, with the gross monociala and dichotic or, with one or two adductor muscles. II. Ecephala, with the classes: 4, pteropoda; 5, gastropoda, with the divisions monociala and dicociala; and 6, cephalopoda, with orders tetraibranchiata and dibranchiata. The cirripeds he places among articulates, though in a class distinct from crustaceans, and he, with his predecessors, retains the bryozoa among radiates.—Siebold (1848) makes three classes as follows: 1, acephala, with orders tunicata, brachiopoda, and lamellibranchia (with suborders monomycy, dimpy, and inclusa); 2, cephalopoda, with orders pteropoda, heteropoda, and gastropoda (with suborders cephalopoda, lamellibranchia, tubicola, pectinibranchia, and pulmonata); and 3, cephalopoda, without orders, but with families nautilus, octopoda, and loligina. (See Burnett's translation, Boston, 1854.)—Leuckart (1848) divides mollusca into four classes: 1, tunicata, with orders ascidia and salpae (he is inclined to make these not simply a class, but a type intermediate between echinoderms and worms); 2, acephala, with orders lamellibranchiata and brachiopoda; 3, gastropoda, with orders heterobranchia, dermatobranchia, heteropoda, ctenobranchia, pulmonata, and cyclobranchia; and 4, cephalopoda.—Before giving the classifications of Milne-Edwards and Agassiz, which seem to be the truest to nature, it will be instructive to glance at a few physio-philosophical and embryological systems as compared with the preceding founded upon anatomical structure. Oken (1809-48) places the mollusca in his province of dermatozoa (sensitive or tegumentary animals) or splanchnozoa (visceral or fleshless animals), and in the circle of vascular, sexual animals, equivalent to malacoza and conchozoa (glandular or shell animals); according to the anatomical system, the vascular animals are either worms (like muscals), arterial (like snails), or cardiac (like kraken or cuttle fishes); according to the de-
velopment of the feeling sense, the sexual animals (the same as the vascular) are either ovary, ophthalmic, or renal. In his system (see his "Physiophilosophy," Ray society ed., 1847) the first class of mollusks (venous, ophalial animals or mollusks) has the following orders: I. Protozooid mussels. II. Conchozooid mussels; this corresponds to the aecphala, and is characterized by a membranous heart with two auricles. The second class (arterial, ophthalmic animals or snails) has the following orders: III. Protozooid snails or androgyni (bisexual). IV. Conchozooid snails or diosii (with separate sexes); this class corresponds to gastropods, having a membranous heart with one auricle. The third class (cardiac, nephritic animals or kraken) has the following orders: V. Protozooid kraken. VI. Conchozooid kraken. It will be seen from this system that the principles of Cuvier respecting the different plans of the four great divisions of the animal kingdom are entirely set at nought; orders, according to Oken, representing in their respective classes the characteristic features of the lower types.—Among the embryological systems may be mentioned those of Von Baer, von Kolliker, Van Beneden, and Vogt. Von Baer (1827-'38) calls the mollusks the massive type, as the body and its parts are formed chiefly in round masses, the shape unsymmetrical, the nerves ganglia diffused and appearing late, and the movements slow and feeble; in the course of development identical parts are produced, curving around a conical or other space. According to Kolliker (1844), in the mollusks the embryo arises from a primitive part, grows uniformly in every direction, and either entirely encloses the embryonal vesicle, even the cephalopods and aecphala, or late (forming a temporary vitelline sac) as in limax, or else contracts above the embryonal vesicle, forming a genuine vitelline sac, as in cephalopods. Van Beneden (1845-'55) places mollusks with worms and radiates under his group of allotocytedones or allovitellians, in which the vitellus or yolk enters the body neither from the ventral nor from the dorsal side; his class mollusca, at the first date, included cephalopods, gastropods, pelecypods, and brachiopods; in his later work he added aecphala, tunicaea, and bryozaa, removing the last two from the polyps; the cephalopods, however, are not allovitellians, and any classification which unites in one group mollusks, worms, and radiates cannot be founded on correct principles. Vogt (1851) adopts the distinction of Kolliker, of animals in which the embryo is developed from the whole yolk, and those in which it arises from a definite part of it, in the former of which he places mollusks, with worms and radiates; he makes a primary division of the cephalopoda, in which the yolk is cephalic, with a class of the same, with the orders tetrabranchiata and dibranchiata. In the division mollusca, with an irregular disposition of the organs, he makes the follow-

ing classes: cephalophora, aecphala, tunicaea, etenophora, and bryozaa. The last three classes constitute his mulluscidea. The separation of the cephalopods is unjustifiable, and the transfer of the etenophora from acephala radiates to mollusks cannot be maintained.—Milne-Edwards (1855) divides the third branch, malacozoaria or mollusca, into the two sub-branches: 1. mollusks proper, with the classes of cephalopods, pteropods, gastropods, and aecphala; and 2. molluscoids, with the classes tunicaea and bryozaa.—Agassiz, in his "Essay on Classification" (1857), makes only three classes of the branch of mollusks: I. Aecphala, with orders: 1. bryozaa (including the verrucella); 2. brachiopoda; 3. tunicaea; and 4. lamellibranchiata. II. Gasteropoda, with orders: 1. pteropoda; 2. heteropoda; and 3. gasteropoda proper. III. Cephalopoda, with orders: 1. tetrametronectiata, and 2. diabranitiata. He includes bryozaa among mollusks, uniting with them the verrucella, the plan of their structure not being radiated, but distinctly bilateral, and gradually leading through the brachiopods and tunicates to the ordinary aecphala; tunicaea show in the simple ascidians undulated young, resembling boltenia, and forming a connecting link with the compound ascidians; cephalopods are homologous with other mollusks in all their systems of organs, and can no more properly be separated from them on account of the partial segmentation of their yolk, than can the mammals from other vertebrates on account of its total segmentation in their case. According to Prof. Owen, some of the compound ascidians have certain affinities to the zoophytes; some of the marine apneusta (like acteon and glauceus) are related to some of the abranitiata anellids; though cephalopods are the highest, they do not pass into amphioxus or any other embryonic form of vertebrate; he retains the bryozaa with the polyps. Prof. Huxley makes the primary divisions of molluscoids and mollusca; the former including the polyyza, tunicaea, and bra-chiopoda, the latter the lamellibranchiata, gasteropoda, pteropoda, and ecephalopoda. Prof. Morse places the brachiopods among the worm-like articulate, and very likely the tunicates and polyzoa belong with them. (See Brachiopoda.)

MALACOPTERYGIANS, a division of fishes established by Artedi in the early part of the 18th century, including such as have the fins rays soft, except occasionally the first of the dorsal or pectorals. Cuvier divided them into three orders: 1, the abdominal, in which the ventrals are suspended to the under part of the abdomen, behind the pectorals, and not attached to the scapular arch, comprising the greater part of fresh-water fishes, as the carp, pike, eat fish, salmon, herring, and their allies; 2, the subbranchial, having the ventrals attached under the pectorals, the pelvis being suspended to the scapular arch, comprising fishes like the cod, flounder, turbot, &c.; 3,
the apodal, wanting ventrals and sometimes the pectorals, including the cœl family. J. Müller limits the term to the group *scombresocidae* of the suborder *pharyngognathi*, including the flying fish. This is rejected by Van der Hoeven, who returns to Cuvier’s divisions, adding, however, a few families. (See *Fishes*, and *Ichthyology*.)

**MALAGA.** I. A S. province of Spain, in Andalusia, bordering on Cadiz, Seville, Cordova, Granada, and the Mediterranean; area, 2,822 sq. m.; pop. in 1870, 505,010. The surface is irregular, being traversed from N. E. to S. W. by ranges of the Sierra Nevada, forming most picturesque and fertile plateaux and valleys, watered by innumerable streams. The chief rivers are the Jenil, constituting part of the N. boundary, the Guadiana, and the Guadaljorce, Guadalmedina, and Velez-Malaga. Lead, iron, tin, zinc, quicksilver, and manganese are found in large quantities. The climate is one of the hottest in Europe, but the great heat is tempered by refreshing breezes from the southwest. The vegetation is everywhere luxuriant; the principal products are grapes of various kinds, especially those named muscatel and Jaere, the sugar cane, pineapples, chirimoyas, and other delicious tropical fruits, aniseed, cumin, liquorice root, sumach, cork, and cochineal. The manufactures include silks, satins, cotton and hemp fabrics, morocco leather, wicker ware, hats, paper, soap, chemicals, and above all the far-famed Malaga wines. Agriculture and fishing are the chief industries in the interior and along the coast. The principal towns, besides the capital, are Velez-Malaga, Alora, Antequera, Colmenar, Ronda, Marbella, and Estepona. II. A city, capital of the province, on a gulf of the same name in the Mediterranean, 262 m. S. by W. of Madrid; pop. about 100,000, or with the suburbs, 130,000. It stands in the centre of a wide bay, surrounded by walls with nine gates, and flanked by high mountains, on the base of which it rises in amphitheatre; and seen from the sea it presents, with the ruins of its ancient fortifications and its Moorish castle, the Gibralfaro, on a lofty eminence to the east, an aspect of much grandeur. The streets, nearly all extremely narrow, and many of them not admitting vehicles, give the town a peculiarly Moorish appearance. The Guadalmedina, crossed by two good bridges, traverses the city from N. E. to S. W., dividing it into two quarters; but the river, which in winter becomes a formidable torrent inundating the streets, is dry in summer, when its bed serves as a thoroughfare. The houses (numbering about 7,000 in 1864) are large and high, and, being all white, look remarkably gay and clean. Most of them are built round a court. The Alameda, near the port, one of the most beautiful promenades in Spain, is surrounded by sumptuous edifices, and embellished with a number of fountains and statues, with rich marble seats at intervals through the grounds. In the Plaza del Riego is a monument to the memory of Torrijos and his 49 confederates executed by order of Moreno on Dec. 11, 1831; and the Paseo de Roding is an agreeable resort. Chief among the public buildings is the cathedral, begun in 1558, and completed in 1719; it is a stately structure in the composite style, with a spire 300 ft. high, and magnificent decorations; the high altar and choir are noteworthy for the perfection of their carved works representing the twelve apostles and many saints. The episco-
pal palace and the custom house are handsome edifices. Among the other notable buildings are the churches and two chapels, eleven convents, ten nunneries, two foundling, one military, and three general hospitals, a prison, four barracks, the post office, and a superb aqueduct. The places of amusement are the theatre and the plaza de toros or bull ring, with a number of concert and dancing rooms. Pipes for the supply of water from the river Torremolinos, 6 m. distant, were laid in 1874. The port is one of the finest and most commodious on the Mediterranean, serving as a refuge for vessels compelled to leave Gibraltar during the prevalence of the S. W. winds. A mole to the east upward of 1,500 ft. long, with a lighthouse upon its outer extremity, offers good protection; and the harbor, which has good anchorage for about 500 ships, is defended by four forts. Among other fortifications is the Gibralfaro, a Moorish castle on the site of a Roman fortress, on a hill commanding the city. The principal articles of export are wines and raisins, including muscatel, the finest in the world, lejía or lye, and sun raisins. The crop of muscatel grapes yielded 2,700,000 boxes of raisins, the best of which go to England and Russia, and the lower grades to the United States. Sugar is extensively manufactured for export; the total production in 1872 was 21,960,000 lbs. The export trade in olive oil has greatly increased, mostly with France, Germany, England, and Russia; and the United States take the most of the lead exported. The total value of the exports to the United States in the year ending Sept. 30, 1873, was $2,814,682; raisins, lemons, and lead forming the principal part. The chief imports are linen, woollen, and silk fabrics, hardware, machinery, and cutlery. The port movements for the year ending June 30, 1873, were 1,028 steamers and 2,749 sailing vessels, with an aggregate of 542,802 tons. The chief manufactures are soap, cigars, hats, leather, white lead, and porcelain; and there are iron foundries, saw mills, lime and brick kilns, and silk-weaving establishments. The educational institutions are a seminary, a naval school, two endowed Latin, and a number of primary schools.—Malaga (anc. Malaca) was founded by the Phoenicians, and subsequently passed under the dominion of Carthage and of Rome. Its name is variously derived. Humboldt ascribes it to the Iberians; others connect it with melah, supposed to be the Phoenician name for salt fish, for the exportation of which the town was famous. In 714 it was seized without opposition by the Moors, who held it till 1487, when it was taken by Ferdinand the Catholic after a protracted siege. In 1810 Sebastián, the French general, took the city, and exacted a contribution of 12,000,000 reals. It was again taken by the French in 1829.

MALAKHOFF, or Malakoff. See CHIMEA.

MALAN. I. César Henri Abraham, a Swiss theologian, born in Geneva, July 8, 1787, died there, May 8, 1864. His ancestors, who were noble and Protestant, fled on account of persecution from Mérindol in southern France to Switzerland in the 17th century. At an early age he became a minister of the state church and a regent in the college of Geneva. Afterward, through the influence of Dr. Mason of New York and Robert Haldane of Scotland, from a Socinian he became a Trinitarian, and received much sympathy from English and Scotch Christians. He often visited England. He published “The Church of Rome” (translated into English, New York, 1844); “Stories for Children” (1856); and “Pictures from Switzerland” (1854). The American tract society and the publishing department of the Dutch Reformed church have printed many of his tracts. His most important work is his volume of hymns, entitled Chants de Sion (1826; enlarged ed., 1841), of which he composed both the words and the music. II. Solomon Caesar, an English clergyman, son of the preceding, was born in Geneva in 1812. After completing his education at Geneva he went to Oxford, where he graduated. He was appointed classical professor in Bishop’s college, Calcutta, in 1838, but from impaired health returned in a few years to England, and afterward resided some time in Arabia. He became vicar of Broadwindsor, Dorsetshire, in 1845, and prebendary of Sarum in 1871. He is said to be able to use in conversation familiarly upward of 20 languages, and to translate upward of 100. Among other works, he has published “Three Months in the Holy Land” (1845); “A Plain Exposition of the Apostles’ Creed” (1847); “A Catalogue of the Eggs of British Birds,” and “A Systematic List of British Birds” (1848); “Magdala and Bethany,” and “The Coast of Tyre and Sidon” (1857); “On Ritualism” (1867); “Life, Labors, &c., of Caesar Malan” (1869); “Our Lord’s Miracles and Parables” (1871); and numerous translations.

MALARIA (Ital. mala aria, bad air), or Marsh Miasm (Gr. μαυετινα, to infect), an emanation which produces in mankind intermittent and remitting diseases. This poison is not cognizable by the senses, nor can it be detected by chemical tests; it is known only by its effects. The concurrence of vegetable matter susceptible of decay, of moisture either on the surface or a short distance below it, and of a certain elevation of temperature, is necessary for its evolution; of these, long continued heat has the greatest influence in increasing the intensity of the poison. Comparatively harmless in the northern part of the temperate zone, it becomes malignant and deadly in places equally favorable to its production, just in proportion to the increase in the mean annual temperature. Marshes, whether salt or fresh, and wet meadows are especially subject to malarial affection: early when drying under a hot sun, ground is alternately flooded and drained are fertile sources of it, and it is this which renders the cultivation of rice so deleterious.
which, from the nature of the subsoil, retain the moisture a short distance beneath the surface, though that may be dry and parched, are favorable to the production of malaria. The process of clearing a new country of its woods, and thus exposing the soil to the full action of the sun, is commonly followed by the prevalence of fevers; and the same evils often follow the ploughing up of meadow lands. It is not necessary that the amount of the vegetable matter be great or its growth recent, since malarious diseases have often been caused by the drainage of ponds and lakes; and the fevers that prevailed at Bourg-en-Dresce ceased on filling in the half wet ditches of the fortifications. The low grounds on the margin of lakes and the aluvial lands bordering rivers in warm countries are always plagued with malaria. In India ground covered with low thick growths of brushwood or of weeds and grass, called jungles, are so well known to produce malarious fevers, that they are there termed jungle fevers; even open woods in tropical climates are productive of malaria. The steeping of hemp and flax, and the decay of vegetable refuse, potatoes, &c., in confined localities, as cellars or the hold of a vessel, have resulted in fever. — The quantity of water required for the generation of malaria is not large, a marsh completely covered with water being innocuous; it is only when the moisture is drying up under the influence of the sun that it becomes pestilential. So in tropical climates disease prevails chiefly at the commencement and after the termination of the rainy season, and is less prevalent while the earth is saturated. In some cases the quantity of vegetable matter concerned in the production of malaria must be exceedingly small. Dr. Ferguson, one of the medical officers in the army of the duke of Wellington, says: "In Spain, during the month of May, 1809, which was cold and wet, the army remained healthy; but in June, which was remarkably hot and dry, marching through a singularly dry, rocky country of considerable elevation, several of the regiments bivouacking in the hilly ravines which had lately been water-courses, a number of the men were seized with violent remittent fever (the first which had shown itself on the march) before they could move from the bivouac the next morning; and this portion of the troops exclusively were affected with this disorder for some time. In this instance, the half dried ravine having been the stony bed of a torrent, in which soil never could be, the very existence of vegetables, and consequently of their humid decay and putrefaction, was impossible, and the stagnant pools of water still left among the rocks by the water-courses were perfectly sweet. Yet this situation proved as pestiferous as the bed of a fen." ("On the Nature and History of Marsh Poison," Edinburgh, 1821.) Here, however, the total absence of vegetable matter would be difficult to prove, and would be in contradiction with all other experience. — Whatever may be the nature of malaria, it is most concentrated near the surface of the earth, and becomes weaker as we rise above it; it is also most active at night, probably from the influence of the sun in rarefying and producing currents in the atmosphere, and perhaps, too, because it has a peculiar affinity for the fogs that are then apt to prevail. In malarious countries it is well known that exposure to the night air is apt to be followed by fever, and that those who sleep in the upper rooms of a house are safer than those who lodge on the ground floor. While as a general rule low and damp grounds are much more unhealthy than the hills in their neighborhood, yet in numerous instances this rule does not hold good, or is even reversed. The experience of the British army in the East and West Indies is conclusive on this point. In many cases this can readily be explained by the effect of winds and currents of air carrying the malaria to the higher ground, which had been generated on the lower; thus in Italy the malaria from the borders of Lake Avernus reaches the convent of the Camaldoles, situated on a high hill three miles distant. Connected with the propagation of malaria by currents of air is the fact that woods sometimes act as a barrier to the prevalence of malaria, which would otherwise be conveyed to it from some neighboring source; in Italy fevers have frequently become prevalent on the cutting down of trees which have thus served as a shelter. It becomes an interesting question how far malaria can be carried by winds. This has been very variously estimated; probably three or four miles is the maximum. — The effects of malaria are by no means confined to the production of fevers and diseases of an intermittent type, but it is only in warm climates and in certain unfavorable localities that its full effects upon the constitution are observed. In such places the vegetation is stunted, the vegetation sallow, the limbs slender, the abdomen rigid, the hair lank and scant, and the teeth defective; life is commonly extinguished before 40 years of age, and the population is only kept up by immigration from healthier localities. Yet it is remarkable that when in such places persons live beyond their 40th year, they frequently recover some measure of health and attain to old age.

MALATESTA, a family of Italy, many of whose members were rulers of Rimini and other cities of the Romagna, and which became affiliated with the house of Montefeltro and with the dukes of Urbino. The founder of the family was Count Carpegna la Penna di Bili, who lived in the 11th century, and who on account of his violent disposition was called mala
testa ("mad head"), whence the surname of his descendants. Among the latter was Malatesta, count of Vernechio, who distinguished himself against the Ghibellines, became ruler of Rimini in 1285, and died in 1312. He was succeeded by his son Malatestino, a zealous en
demy of the Ghibellines, who in 1314 added Ce
seno to Rimini, and died in 1317. Three of his brothers were deformed. Giovanni, one of the most repulsive of them, had for wife Francesca da Polenta, daughter of Guido the elder, lord of Ravenna. She became the mistress of her brother-in-law Paolo, though he was also married, and Giovanni killed his wife and brother with the same sword (1289). Dante, in his *Inferno*, gives a thrilling narrative of this tragic end of Francesca and Paolo da Rimini, and the story is a favorite theme of poets and artists. Malatestino was succeeded by his brother Pandolfo I., instead of by his son Ferrantino, the former being confirmed by the pope on account of his vigorous opposition to the Ghibellines. He was munificent, but disgraced his reign by the murder of his nephew, the count of Ghiazzolo. On the death of Pandolfo in 1326, his nephew Ferrantino was installed as ruler. He served against the infidels in Palestine, but after a conflict with one of his relatives he was expelled from Rimini by the pope in 1335, and died in 1338. Two sons of Pandolfo, Malatesta II. (died in 1364) and Galeotto (died in 1358), became joint rulers after the expiration of Ferrantino. They made peace with the pope, and added to their dominion Fano, Possombrone, Pesaro, and some other possessions. Galeotto was succeeded by his sons Carlo (died in 1429) and Pandolfo III. (died in 1427). The former was lord of Rimini and a part of Romagna, sided with Pope Gregory XII. during the schism, and represented him at the council of Constance, after having commanded the Venetians against the emperor Sigismond. Subsequently, while aiding the Florentines to expel the Milanese, he was for some time imprisoned at Milan (1427). He was the best soldier and the most renowned ruler of the whole family. Pandolfo III., after having conquered Brescia and Bergamo, was driven in 1421 from the latter city by the duke of Milan. The most remarkable among his descendants was Sigismondo Pandolfo (died in 1468), who successively commanded the Florence, Neapolitan, Aragonese, Venetian, and Sienese armies, and conquered for Venice a portion of the Morea. He was excommunicated by the pope in 1462 for having made war upon the Roman see. He was a munificent patron of letters and art, and had palaces built and libraries established in Rimini. His first wife was a daughter of the marquis of Este, and his second of Francesco Sforza. The last ruler of Rimini was Pandolfo IV., who in 1503 was robbed of his patrimony by Cesare Borgia. After Borgia's death he returned to Rimini, but was expelled in 1526 by Pope Clement VII., and died in want at Ferrara.

**MALAY ARCHIPELAGO.** See Indian Archipelago.

**MALAYO-POLYNESIAN RACES AND LANGUAGES.** The Malay-Polynesians are the light-complexioned, olive-colored, and straight-haired inhabitants of the islands of the Indian and Pacific oceans, from the Andamans in the bay of Ben-gal in the west to Easter island on the east, and from Formosa and the Hawaiian islands in the north to New Zealand in the south. They occupy also the Malay peninsula on the Asiatic continent, and partly also the island of Madagascar adjacent to the African coast. Ethnologically and linguistically they form two great divisions, Malayans proper and Polynesians. The former chiefly occupy the western islands, and the latter the groups E. of the Philippines and Booro, subdivided into Micronesia, Melanesia, and Polynesia (in the narrower sense). The original inhabitants of all these islands were the Papuans, a dark race, with woolly hair growing in tufts. (See *Papuan Races and Languages.*) The Malayo-Polynesians came from the S. E. of Asia, occupied at first only the islands adjacent to it, and gradually extended their territory to the east, either expirating the previous inhabitants, or driving them into the interior of the islands and taking possession of the coasts. Their relation to the Papuan population of these islands therefore is similar to that of the Aryans to the Dravidas of India. Some contend that Polynesia was the earliest home of these races, and that they came originally from the American continent, but the hypothesis seems untenable. Though the Malayo-Polynesian type and culture are purest and quite primitive in the eastern groups of islands, yet the character of their fauna and flora is exclusively Asiatic, and the numerous historical traditions current among the people record migrations only from the west. These traditions, together with the fact that many of the names of the islands of Polynesia proper are variations of those belonging to the Tonga and Samoan groups, point to the latter as the common source of the population of the former. On Tonga and Samoa there are traditions that the paradise and cradle of the Polynesians is the island called Bulotu or Poretu, which is probably Booro, E. of Celebes. From the great similarities existing among the languages and customs of the various Polynesian races, it is inferred that the migrations from Tonga and Samoa do not date back to very remote periods. The circumstance that the traditions leap from Booro at once to Tonga, leaving the whole of Melanesia entirely untouched, renders it probable that the Polynesians on their departure from Booro made no large settlements on any of the islands between Papua and the Samoan archipelago, and that the few who chose to establish themselves on them accordingly became largely intermixed with Papuan elements. Of a similar impure type are the Micronesian Polynesians. The separation of the Polynesians from the Malayans and their emigration from Booro may be fixed at about 1600 B. C., as the literature of the latter was developed before our era, and shows even then a strong mixture of Old Indic or Sanskrit elements, which cannot be found in the speech of the former. The Polynesian languages, there-
fore, are considered to represent the primitive forms of speech.—To the western or Malayan division of the Malayo-Polynesian races belong the Tagalas or Bisayas (inhabitants of the Philippines), the Malays of Malaca, the Acehnese of Sumatra, the Sundanese, the Javanese, the inhabitants of Bali and Madura, the Batak of the interior of Sumatra, the population of Nias and Batoo islands, the Hovas of Madagascar, the Dyaks of Borneo, the Mankassars (Macassars) and the Bughis of Celebes, and the Alfooros of the Moluccas and the adjacent islands. To the eastern or Polynesian division belong the Polynesians proper, the Melanesians, and Micronesians. The Polynesian race embraces the inhabitants of the Samoa group or Navigator's islands, the population of the Tonga group or Friendly islands, the Maoris of New Zealand, the Tahitians, the inhabitants of the Rarotonga group or Cook's islands, the people of the Tubuai group or Austral islands, of the Low archipelago or Tounamotou islands, of the Marquesas islands, of the Hawaiian or Sandwich islands, and of numerous isolated islands in the Pacific ocean. The most eastern island inhabited by Polynesians is Vahia or Easter island, and the most western Tikopia or Tukopia. To Micronesia belong the islands E. of the Philippines to lon. 180°, and from the Marianas or Ladrones in the north to the equator in the south. The population of the Marianas or Ladrones is in part extinct, and many groups of the Carolines are also uninhabited. The people of the Gilbert archipelago form the transition from the Micronesians to the Polynesians. The Melanesians embrace the inhabitants of the Fiji group, of New Caledonia, of the New Hebrides, and of several of the islands extending thence to Papua, whose ethnological character has not yet been definitely established. The physical constitution of the Malayo-Polynesians (excepting the Melanesians, who present a strong Papuan type) presents three fundamental forms, generally designated as the Malayans, Batak, and Polynesians. The pure Malayans are commonly found among the Malays proper, Rejangs, Acehnese, Javanese, Madurese, and Tagalas. They are generally 47 or 5 ft. high; the skull is equally long and broad; the back of the head is short and square; the cheek bones protrude; the jaw bone is broad and prominent; the nose flat; the nostrils broad and large; the eyelids not as large as those of the Mediterranean races, nor as narrow as those of the Mongolians; the eyes are black, but not brilliant; the mouth is large, with thick lips, but not puffed up; the skin is copper brown with a tint of yellow; there is scarcely any beard, and the hair is straight, coarse, and black with a touch of brown; the loins and calves are thin and weak. The women are shorter than the men; their breasts are small, pointed, and firm, and their bosoms little developed and often quite flat. The Batak type is represented by the Batakans, the inhabitants of Nias, Bato, and Bali, the Bughis, and the Mankassars and Alfooros. The body is taller, larger, and more muscular, the skull and face more oval, and the back of the head rounder; the cheek bones are less prominent and the jaw not quite so broad; the nose is rather pointed and straight, and depressed at the root; the mouth is smaller and better proportioned; the skin is light brown, and the cheeks show a tinge of red; the hair is straight but thinner, and with a clearer shade of brown; the breasts of the women are larger and hemispherical, and the bosom is fuller and higher. The Polynesians are of a still higher stature, and their bodies are generally well proportioned and athletic; the women, however, are rather short and stout, with breasts like those of the Malays; the skin is several shades darker, especially in the furthest north and south, while the population of the equatorial islands is the lightest of all; the eyes are small, black, and not very vivid; the hair is straight, coarse, black with a tinge of blue, and a little inclined to curl, the use of coral chalk giving it sometimes a reddish or flaxen color; the growth of beard is little developed. The principal trait of the character of the Malayo-Polynesians is undoubtedly tactfulness and reserve, which is softened only in case of ad- misture with Papuan blood; they dislike to be approached very closely, and they lay great stress on keeping within the bounds of deportment which custom prescribes for the various classes of society; there is therefore an abundance of ceremonials among the peoples of the west, and of tabu laws among those of the east. They are possessed also of an almost incredible degree of savagery and bloodthirstines. They are the cannibals par excellence, not through want of food but through the peculiar hardness of their character. Cannibalism is practised not only among the inhabitants of the South sea islands, but even among several of the half civilized races of the west, such as the Batakans of Sumatra, who have produced a written literature, and who have cannibal rites in certain cases even prescribed by law. They are generally good and fearless seamen, and readily undertake long journeys in boats apparently very unsafe. They possess good powers of observation, and are inclined to adopt the ideas of foreigners, and also to imitate their customs. The sentiments of family and obligations are but little developed. Infanticide is of frequent occurrence; old, feeble, and sick persons are badly treated and sometimes killed; prostitution is prevalent, and parents exercise but little authority. Love of gain, however, is the strongest passion among them, and lying, stealing, murder, and all manner of crimes are unscrupulously employed whenever they offer a chance of profit. The hope of plunder is their principal cause of war, and piracy is in the Indian archipelago considered to be an honorable and chivalric occupation. They are brave, and do not hesitate to poison their weapons, and to play cow-
and tricks on their enemies. They are easily excited to religious emotions, and their rich store of legends testifies to the vividness of their imagination. The Javanese are the most cultured among them, and evince capacity for a high degree of intellectual development. (For the peculiar customs of the various races, see the articles descriptive of their habitats.)

**Languages.** The Malayo-Polynesian languages form an independent group, unconnected with any other. They are derivatives of an extinct primitive form of speech, which suffered three or four dialectical variations before it had attained its complete development. They do not possess the same grammatical structure throughout, but only agree more or less in the system of sounds, the general form of the verbal roots, and the main principles of grammar. In degree of development the Polynesian languages stand lowest; the Micronesian and Malenesian are a step higher; and the Malay, and especially the Tagala languages, occupy the highest rank. The known languages of the eastern or Polynesian division are the idiom of the Marinas or Ladrones, which forms the connecting link with the Malay languages; the languages of the Feejee, Annam, Erromango, Tanna, Malikolo, Mare, Lifoo, Baladea (New Caledonia), Banro, and Guadalcanar islands, which are all more or less closely related; and the Maori, the language of New Zealand, with its kindred languages of the Tonga, Rarotonga, Tahiti, Hawaiian, and Marquesas islands. Of the western or Malay division, there are known in the Philippines the Tagala of the south of Luzon, the Pampanga of the southwest, the Ilocano and Bicol of the southeast, the Ybanag of the province of Cagayan, the Bisaya spoken on several islands of Luzon, and the Zebuana on Cebu and the adjacent islands. Closely related to them are the languages of Formosa, of which the Favorlang and Sidea dialects are best known. Three dialects are known of the Malagas, or language of Madagascar, viz.: the Ankova dialect, spoken by the Hovas in the interior of the island, the Betsimisaraka dialect of the east, and the Sakalava dialect of the west. The Malay language proper, which is in extent and in regard to its literature the first among the whole group, is spoken on the Malay peninsula and the adjacent islands, and on the coasts of Sumatra. Two dialects may be distinguished in it, the Malacca and the Menankanow or Padang. Besides these dialects, a literary or choice language is employed by the Malays. Several authors divide the various modes of speech according to castes: bahasa dailam, the language of the court; bahasa bairatan, that of the educated classes; bahasa dagori, that of merchants and traders; and the bahasa kafihan, that of the people. The Malay language possesses a large and varied literature, the beginnings of which date back to the 13th century A.D. and which is especially rich in poetical works, legendary narratives, Mohammedan theology, jurisprudence, chronicles, travels, and various paraphrases of Indie epics. Besides the Malay proper, there are several minor languages spoken on Sumatra, as the Batak in the interior of the northern portion of the island, and the languages of the Rejang and the Lampong in the south. Javanese is spoken on Java and several adjacent islands, and stands in importance next to Malay, but its literature reaches back to the 1st century of our era. (See Java, Language and Literature of.)

Closely related to Javanese is the Sunda language, spoken on the western portion of Java. Of the languages in Borneo, that of the Dyaks is well known; according to the missionary Hardeland, it has four dialects. The Dyaks have not produced a written literature, but they possess a number of ancient songs composed in a peculiar and only partly intelligible language, which they call baisa sawahan or the language of the good beings, i.e., the spirits of their ancestors. The Baghias and Mankassar (Macassar) languages, spoken in Celebes, have also been investigated.—The statement above made that these languages form an isolated family of speech is in accordance with the latest researches of Friedrich Müller, on whose elaborate treatise on the Malayo-Polynesian languages in the Reise der österreichischen Frei gate Novara: Linguistischer Theil (Vienna, 1867), and excellent ethnological account of the races in his Allgemeine Ethnographie (Vienna, 1873), this article is based. Bopp, in the Abhandlungen der Berliner Akademie (1840), is not of the same opinion. He holds the Malayo-Polynesian languages to be a branch of the Aryan or Indo-European family, and direct descendants of the Indie group. He drew his conclusion from the fact that the Malay and Javanese languages contain a large amount of Sanskrit elements, which however do not belong to the original stock, and were gradually incorporated, as both history and the absence of Indie forms in the Polynesian languages amply testify. Max Müller has taken still another view of the relation which these languages hold to other families of speech. In Bunsen's "Christianity and Mankind" he attempts to establish that the Malayo-Polynesian languages form a member of the great so-called Turanian family, and that they are especially closely related to the Tai languages. He says: "A language which shares so many grammatical principles in common with Khamti and Siamese, and differs from Sanskrit on every essential point of grammar, can no longer be counted as a degraded member of the Aryan family, however great the authority of him who first endeavored to link Sanskrit and Malay together." Friedrich Müller has a satisfactory argument in the above cited work to show that the seeming similarities in so-called grammatical forms in the Tai and Malayo-Polynesian languages do not warrant us in considering the latter a derivative group of the former. Numbers constitute one of the highest linguistic tests of
relationship, and the following table of the first ten cardinal numbers in the most important of the Malayo-Polynesian languages shows at once the close connection existing among them, and their isolation from other families:

**The First Ten Cardinal Numbers in the Malayo-Polynesian Languages.**

We shall state only the principal features of the two groups. The Polynesian languages possess the consonantal sounds k, n, h, t, n, s, l, r, p, m, f, w, r, and in several of the languages some of these consonants are absent, and diphthongs are entirely unknown. Syllables may begin with a consonant, but must end with a vowel; accumulations of consonantal sounds are carefully avoided. The accent rests generally on the penult, and seldom on the antepenult or the ultimate. Roots, like those of the Aryan and Turanian families, are not found; there are only a sort of verbal stems, which in their external verbal movement resemble those of the Semitic languages, but consist throughout of two syllables. The various derivatives are formed from these either by means of reduplication, or by prefixes or suffixes. Distinctions of number like those in the inflected languages are wanting. Nouns designate thoughts or objects in a peculiar vague manner, implying rather plurality than singleness, and require the introduction of certain elements into the sentence to render more definite their use in the singular number. Some of these elements represent the numeral one, and others have the force of demonstration. When it is desired to render the plural number more distinct and definite, the noun is coupled either with a numerical expression or with some indefinite pronominal stem. A number of particles are used to designate nominative, genitive, dative, accusative, instrumental, locative, social, ablative, and ablative cases. As nouns do not possess grammatical gender and do not admit of inflection, adjectives also remain entirely unchanged, and are used attributively by placing them behind, and predicatively by placing them before their nouns. The dual and plural of pronouns are indicated by composition with the numbers two and three, and possess an exclusive and inclusive form, according as the person addressed is excluded or included. The Polynesian verb is extremely indefinite. Externally indistinguishable from the noun, it is recognized as a verb only by its position in the sentence and its connection with the pronoun. The essentials of time and voice remain vague; even whether an action or a state of being is designated must be inferred from the introduction of certain affirmative particles. The Malay languages employ the consonants k, g, h, t, r, p, m, f, w, r, and in the vowel sounds a, â, ã, ñ, ê, o, ã, ê, ê, ë (see Warrig); genuine diphthongs are unknown. This system of sounds does not include the foreign elements found in Malay and Javanese. The Tagala languages have no palatals; Javanese makes use also of cerebrals, and Bugis of nasals. Malayan syllables always open with a single consonant, and the penult is always accented, causing a lengthening of the vowel. Instead of roots, the Malay languages possess only stems or variations of roots, which were originally dissyllable, though probably after having passed through trisyllabic forms developed from monosyllables. Words of a single syllable now used are unmistakable contractions of dissyllables. Re-
duplication, prefixing, suffixing, and infixing are the processes of word-building. While the Polynesian languages employ certain forms of words as nouns and verbs without any special vocal changes and additions, the Malayan languages attempt to distinguish the parts of speech independently of their position in a sentence. A noun not specially qualified designates the sum of all the persons or objects of which it is the name, or has always the force of an indefinite plural. The numeral one, or a demonstrative or possessive pronoun, added to it, reduces a noun to the singular number. The definite plural is formed either by reduplication, as in Malay râda, king, râda-râda, kings, or by the addition of plural expressions, many, multitudes, &c. The cases are indicated by prefixing prepositions. Adjectives remain invariable; comparison also is made by external aids. Besides the usual pronominal forms, it is customary, especially in Malay and Japanese, to employ servile and ceremonious expressions for the first and second persons. The force of a verb is indicated by prefixes, its relation to the object by suffixes; and though the Malayan verb differs somewhat from a noun, yet it may take the place of the latter by being merely placed in conjunction with particles used to modify nouns. In Malay the present tense is determined by bâgi, still; the pret erite by sudah or têla, done; and the future by hendak or mâw, to will, want, to expect, or akan, to, in order to.—See, besides the works of Friedrich Müller above cited, Ellis, "Polynesian Researches" (London, 1829); Yvan, "Six Months under the Malâys" (London, 1855); Turner, "Nineteen Years in Polynesia" (London, 1860); Waizt, Anthropologie der Naturvölker, continued by Gerland (Leipsic, 1860-69); Cameron, "Our Tropical Sessions in Malay India" (London, 1865); West, "Ten Years in South Central Polynesia" (London, 1865); Wallace, "The Malay Archipelago" (London, 1869); Seewald, Die Philippinen und ihre Bewohner (Würzburg, 1869); and Perty, Anthropologie (Leipsic, 1873-4).

MALAY PENINSULA, the name given by geographers to the long and narrow tract which projects southward from Indo-China, and forms the southern extremity of the Asiatic continent, bounded E. by the China sea and the gulf of Siam, and W. by the bay of Bengal and the straits of Malacca. It is sometimes called by the Malays Tana Malâyi, "Malay Land," and is supposed to be the Golden Chersonese of the ancients. It extends from the parallel of the head of the gulf of Siam, in lat. 13° 30' N., to Cape Burus on the southwest, about 80 m. from Singapore, in lat. 1° 15' N., and to Cape Romania on the southeast, in lat. 1° 17' N.; length about 900 m., greatest breadth about 180 m.; estimated area, exclusive of Tenasserim, about 80,000 sq. m.; pop. conjectured to be about 500,000. The upper and narrower part of the peninsula has a population composed chiefly of Siamese, or a mixed race of Siamese and Malays called Samsun. The western half, N. of lat. 10°, forms a part of the district of Tenasserim in British Burmah. The lower part, or the peninsula in the restricted sense, is the country of the Malays, and has an area of about 60,000 sq. m. Along the shores of the peninsula are many islands, of which the principal are Salang, Truta, Lancaeva or Langkavi, and Penang on the W. side, Singapore, Batan, and Bingtang at the southern extremity, and Tantalem on the E. coast. The most important political division of the peninsula is the British Straits Settlements (Penang, Malacca, and Singapore), which, though small in area, have about half the population of the country. With the exception of the portion included in Tenasserim, the N. part of the peninsula, as far S. as the bay of Chuya on the E. coast, in about lat. 9° N., is subject to the king of Siam. The Malay states are Quedah, Perâk, and Salangore on the W. side; Patani, Kalantan, Tringganu, and Pahang on the E. side; Rumbowe, Jehole, and Jompol in the interior; and the principality of Johore, which comprises the southern extremity of the peninsula. A few of these are dependent on Siam, several only nominally; but most of them are independent and under the protection of the British. A range of granite mountains runs through the whole length of the peninsula, on both sides of which spread alluvial plains, not much elevated above the sea. The maximum altitude of the range is attained E. of Quedah, between lat. 6° and 7° N., where it is about 6,000 ft. Further N. the loftiest peaks are only about half this height. The most extensive of these plains are on the W. side of the mountains. The rivers are numerous but small, and few of them navigable except so far as the tide ascends them; the largest are the Perâk on the west and the Pahang on the east. The only lake of any considerable extent lies between Malacca and Pahang. The zoology of the peninsula is varied and extensive. There are ten species of monkeys, and an ant-eater. There are several species of bats, of which the most remarkable is the kalung or vampire, which is larger than a crow; it flies high in great flocks, and is very destructive to fruit. The only plantigrade animal is a small bear (ursus Malayanus). There are eight species of the feline family, of which the largest are the tiger and the leopard, both very numerous and destructive to human life. The domestic cat has a tail about half as long as that of the European cat. The domestic dog exists as a vagrant without a master, and there are said to be wild dogs in the forests. The Indian elephant and two species of rhinoceros are met with. The Malay tapir and the wild hog are abundant. The ox and the domesticated buffalo are used for riding and for draught. The domestic ox is small and short-legged, but strong and hardy; and there are two species of wild ox, one of which, called by the Malays satadang, seems to
be peculiar to the peninsula. There is a species of wild goat, and a small species of domestic goat. Three species of deer are met with in the peninsula, one of which is the small muntjac. The sheep and the rabbit are not indigenous, but have been introduced by Europeans. Swine and fowls are very abundant. The most remarkable birds are the morok or wild peacock, the double-ruffled peacock, a small and beautiful species, several species of pheasants, a partridge, snipe, sun birds, woodpeckers, the wild cock, and the domestic cock, the last a small but very courageous bird. The species of pigeons are very numerous, and some are no larger than a thrush; the prevailing color is green. The parrot family is numerous, but is not remarkable for brilliancy of plumage. The swallow whose nest is eaten by the Chinese is found in the caves of the islands. The birds of prey consist of the variety of kites and hawks. Among the reptiles are the alligator, the iguana, several species of small lizards, and about 40 species of snakes, of which three or four, among them the cobra, are venomous. Fish are very plentiful, and form the principal animal food of the mass of the people. The white pomfret, called bawal by the Malays, is said to be one of the most delicate fishes in the world to the European palate. The only cetaceous animal is the dugong. The neighboring seas afford a large and beautiful variety of shells. The forests yield ebony, sapan, and eagle wood, and several species valuable for timber. Rattans, bamboo, and palms furnish most of the materials used by the Malays in constructing their houses. Rice, coconuts, yams, the sugar cane, and esculent fruits are the chief products of agriculture. The grain used on the peninsula is mostly imported from Sumatra and Bengal. Among the fruits, those most esteemed are the durian and the mangosteen. The durian is an oval spine-covered fruit, of a green color and about as large as a coconut, while the mangosteen is reddish brown in color and spherical in shape. Pineapples are plentifully produced in great perfection. Caoutchouc and other valuable gums and resins, drugs, spices, ivory, and horns are exported, and coffee, cotton, and tobacco are raised. The most remarkable and valuable product of the peninsula, however, is the gutta percha tree, which was here first made known to Europeans. The tin mines in many parts of the country are extensive; but they are imperfectly worked, and of late years, owing to the exhaustion of surface ores, the product has declined. Some gold is produced. The climate of the peninsula is hot and moist. The mean annual temperature at the level of the sea is nearly 80°, the mean range being from 70° to 90°. There is no rainy season, but rain falls at short intervals throughout the year, and there are heavy dews and frequent fogs. Generally the climate is not unhealthy, though there are some spots infected with a most pestiferous malaria.—The native population of the peninsula, with the exception of the northern portion and the black woolly-haired people known as the orangs, who inhabit the interior part of the Malay race, and speak the Malay language. Most of the Malays are settled and civilized, but others lead a nomad life on the land, the rivers, or the sea. The land nomads practise a rude agriculture; the river nomads live entirely in boats, and subsist on fish and wild roots. Their boats are about 20 ft. in length; at one end is the fireplace, in the middle are their utensils, and at the stern is the sleeping place, where beneath a mat a family of five or six, together with a cat and dog, frequently find shelter. In these boats they skirt the shores of the rivers, collecting their food from the forests, and when one spot is exhausted proceed to another. These people are pagans, and are very ignorant and filthy in their mode of life. The sea rovers roam over the whole archipelago in their prahus or boats, and are generarily pirates. The civilized and settled Malays are Mohammedans, and their governments are despotic. The peninsula is supposed by some writers to have been the original seat of the Malay race. The civilized Malays all claim to be descended from emigrants from Sumatra, who in the 12th century (about 1100) entered the peninsula at its S. E. extremity, where they founded Singapore, and gradually drove back the indigenous inhabitants into the mountains. At the close of the 18th century the Malays, who had been pagans up to that time, adopted Mohammedanism, and from the year 1276 Mohammedan monarchs reigned at Malacca. In the 15th century a large part of the peninsula became subject to Siam. In 1511 Mohammed Shah, the Malayan sultan, was overthrown by the Portuguese under Albuquerque. At present the peninsula is much less populous than formerly, owing to foreign and intestine wars and the incursions of pirates. (For British possessions on the peninsula see MALACCA, PENANG, SINGAPORE, AND STRAITSETTLEMENTS.)

MALBONE, Edward G., an American portrait painter, born in Newport, R. I., in August, 1777, died in Savannah, Ga., May 7, 1807. When very young he painted a landscape scene for the Newport theatre, afterward employed himself in drawing heads in miniature, and at 17 years of age settled in Providence as a portrait painter. He removed in the spring of 1796 to Boston, where he was well received, and during the next four years pursued his art with industry in various cities. In 1800 he accompanied Washington Allston to Charleston, and in 1801 sailed for Europe. Malbone remained a few months in London, where he was urged by Benjamin West, the president of the royal academy, to take up his permanent residence; but he returned to Charleston in December. For several years he painted miniatures in the chief cities of the United States; and in 1806 he visited the West Indies, hoping to regain his health, but in vain. His best picture is
MALCOLM

“The Hours,” in which three female figures
represent the Present, Past, and Future.

MALCOLM, Sir John, a British diplomatist, born
in Eskdale, Dumfriesshire, May 2, 1759; died
in London, May 21, 1838. He was sent to In-
dia at the age of 13, in the charge of his uncle,
Dr. Paisley, and received a cadetship under the
East India company. In 1779 he was made
captain, distinguished himself in a series of im-
portant services by bravery and intelligence,
and after the fall of Seringapatam was secre-
tary to the commission appointed to divide
Mysore. In 1799 he was commissioned by
Lord Wellesley to negotiate with Persia a de-
defensive alliance against an anticipated French
invasion of India. He had at this time ac-
fquired several eastern languages, and had been
in 1792 staff interpreter of Persian. In 1801
he was appointed private secretary to the gov-
ernor general, but was again sent to Persia in
the following year. In February, 1803, he
became commissioner of Mysore, and joined
the army of Gen. Arthur Wellesley in the
Maharatta campaign. In 1805 he was recalled
to Bengal, where he was actively occupied in
forming treaties of alliance with native princes.
In 1808 he went again to Persia, but did not
obtain the advantages hoped for by the British
government. On returning thither the next
year as plenipotentiary, owing to a change in
the ministry, he was received in the most flat-
terning manner, and on his departure in 1810
was honored with the order of the sun and
moon and made a khan and sepadar of the
empire. In 1812 he went to England, was
 knighted, and published a “History of Persia”
(2 vols. 4to, 1815), the materials for which he
had drawn from original Persian annals as well
as extensive personal research and observation.
On returning to India in 1817, he was appointed
political agent in the Deccan, with the rank of
brigadier general in the army. He served
under Sir T. Hislop as second in command
during the Maharatta and Pindaree wars, and
especially distinguished himself at the battle of
Mehidpoo, in which Holkar was routed. After
this war he was appointed governor of Malwa
and the adjoining provinces, with the
rank of major general. The country was then
in a state of anarchy, brigandage and rapine
being generally prevalent; he succeeded in
restoring order, and governed mildly but firm-
ly. An account of this period in India was pub-
lished by him in 1823, under the title of
“A Memoir of Central India.” He was in England
from 1821 to 1827, when he was appointed
governor of Bombay, which office he held for
three years, and then returned to England. He
was elected not long afterward to parliament
for Lancaestcr, and distinguished himself by
active opposition to the reform bill. A mon-
ument was erected to his memory in Westmin-
ster abbey, and also an obelisk 100 ft. high near
Langholm, in Eskdale. He also published a
“Sketch of the Political History of India from
1784 to 1823” (London, 1826), and a “Life of
Lord Clive” (1836).—See “Life and Corre-
respondence of Sir John Malcolm,” by John W.

MALCOM, Benjamin, an American clergyman,
born in Philadelphia, Jan. 19, 1799. He en-
tered Dickinson college in 1813, was licensed
to preach in May, 1818, by a Baptist church in
Philadelphia, and entered Princeton theo-
drical seminary, where he remained two years.
On finishing his studies he was settled over a
church in Hudson, N. Y., and afterward in
Boston and Philadelphia. He was president
of the college at Georgetown, Ky., from 1829
to 1849, and of the university at Lewisburg,
Pa., from 1851 to 1859, having been obliged by
the failure of his voice to relinquish preaching.
In both institutions he filled also the chair of
metaphysics and moral philosophy. The dis-
ease in the throat increasing, he retired to pri-
vate life in Philadelphia. In 1841 he received
the degree of D. D. simultaneously from the
university of Vermont and Union college, N.
Y., and after his resignation at Lewisburg was
made LL. D. by that institution. He visited
most of the countries of Europe, and travelled
as a deputy from the Baptist missionary soci-
ety in Hindostan, Burmah, Siam, China, and
Africa. He was one of the founders of the
American tract society, of which he was a vice
president from the beginning. He was also
one of the prominent laborers in establishing
the American Sunday school union, having
visited on its behalf, when first organized,
every principal city in the United States.
Among his works are: a “Dictionary of the
Bible” (18mo, Boston, 1828; enlarged ed.,
1853); “The Extent of the Atonement;”
“The Christian Rule of Marriage” (1850);
“Memoir of Mrs. Malcolm” (1853); “Travels
in Southeastern Asia” (2 vols. 12mo, Boston,
1859); and “Index to Religious Literature”
(2d ed., Philadelphia, 1870). He has also pub-
lished several addresses and other tracts, and
edited the “Imitation of Christ,” Law’s “Se-
rious Call,” Koch’s “Travels of True Godli-
ness,” Henry’s “Communicant’s Companion,”
and Butler’s “Analogy of Religion.”

MALCZEWSKI, Antoni, a Polish poet, born in
Volhynia about 1795, died in Warsaw, May 2,
1826. He served in the army from 1811 to
1816, and afterward travelled in Italy, Switzer-
land, and France. Having gone to Volhynia,
he eloped to Warsaw with the young wife of
one of his neighbors, whom he had cured of
dangerous illness by magnetism. Want and
misery, however, soon embittered the life of the
lovers, and hastened the death of the poet.
His principal work, “Marja” (Warsaw, 1825),
a metrical romance in the style and spirit of
Byron, which appeared in the last year of his
life, was severely criticised, but is now gener-
ally recognized as one of the gems not only of
Polish but of modern poetry. It has passed
through numerous editions, and has been trans-
lated into French by Clémence Robert, and into
German by K. R. Vogel.
MALDEN, a town of Middlesex co., Massachu-
setts, on a stream of the same name, navigable
by vessels of 300 tons to within half a mile of the
main village, and on the Boston and Maine
railroad and the Saugus branch of the Eastern
railroad. 5 m. N. of Boston; pop. in 1870,
7,057. It is connected with Charlestown by a
bridge 2,420 ft. long. The manufacturing in-
dustry of the town is extensive, the chief arti-
cles produced being India-rubber boots and
shoes, lasts, boot trees, enamelled leather, coach
lace and tassels, and iron pipes. There are es-

MALDIVES, or Maldives Islands, a chain of
small coral islands in the Indian ocean, about
450 m. W. of Ceylon, extending in a straight
line from lat. 7° 6' N. to 0° 40' S., between
lon. 72° 48' and 73° 48' E. The length of the
chain is about 550 m., and its breadth about
50 m. The number of islands is commonly
stated by the natives at 12,000, but is supposed
to be in reality nearly 50,000. Their aggregate
area is about 2,000 sq. m. The great majority
of them are mere rocks or sand banks, and
only the larger islands are inhabited. They
are divided into 17 atolls or circular groups,
each atoll being enclosed by a coral reef, gen-

erallv about 90 m. in circumference. These
reefs have channels through them navigable by
the boats of the natives; and though the sea
beats with great violence on the outside, the
water within the reefs is calm and generally
shallow. There are deep channels between the
atolls, four of which have been examined by
European vessels and found navigable by the
largest ships. The principal island is Male, in
lat. 4° 10' N., lon. 73° 40' E.; it is 7 m. in cir-
cumference, and contains 2,000 inhabitants. It
is the residence of the sovereign, who bears
the title of sultan of the Twelve Thousand Isles,
and who acknowledges some degree of depen-
dence on the British government of Ceylon,
to which he annually sends an embassy with
tribute, and receives presents in return. The
population of the whole cluster is estimated at
from 150,000 to 200,000. The highest land in
the islands is only 29 ft. above the sea. Each
island is circular in form, and has a lagoon in
the centre. The soil is sandy, and at the depth
of 3 ft. a layer of sandstone is found. The
inhabited islands are richly wooded with palms,
fig trees, citron trees, and breadfruit trees.
They produce abundance of millet, and of a
similar small grain called brinby, of both which
the inhabitants reap two harvests in the year.
They also gather various roots, which, with
rice imported from Hindostan, and fish and
cocoanuts, constitute their food. The climate
is excessively hot, though the nights are cool
and the earth is refreshed by heavy dews.
The islands are unhealthy to Europeans.
From April to October is the rainy season,
during which the westerly winds are boisterous.

In the dry season, from October to April, the
winds are easterly. The islands breed prodig-
ious numbers of wild ducks, pigeons, and other
wild fowl, which are much used for food, and
sold very cheap. There are no large quadru-

peds except a few sheep and cows. Cats, pole-
cats, and ferrets are found, and rats are very
numerous and troublesome. There is a poison-
ous species of water snake, and the mosquitoes
are said to be larger and fiercer than in any
other part of the East Indies.—The Maldivians
are strict Mohammedans. They are handsome,
well made, and generally of an olive complex-
ton, though some have much fairer complexions
than others, which is probably attributable to
their descent from Persian or Arab stock, while
the majority of the population are obviously of
Hindoo origin. The people are ingenious and
industrious, and have attained to some degree
of civilization. They clothe themselves in silk
or cotton robes, and are cleanly in their habits,
both sexes bathing regularly once a day. The
men shave their heads, but allow their beards
to grow. The women allow the hair to grow
long, and fasten it up behind. They are not
kept secluded as in other Mohammedan coun-
tries, but enjoy a tolerable degree of liberty.
The Koran is the supreme law, but there are
various peculiar local laws and usages. An in-
solvent debtor becomes the servant of the cred-
itor until the debt is worked out. The ordi-
nary punishment for criminals is whipping, which
is sometimes inflicted so severely as to produce
death. Frequently criminals are punished by
banishment to the southern islands. The peo-
ple learn to read and write Arabic as well
as their own native language, and they have
schools in which the mathematics and naviga-
tion are taught. Polygamy to the extent of three
wives is tolerated, and divorce is restricted
only by the necessity of paying back the dowry
received from the wife. The people are a quiet
and pacific race, kind and hospitable to stran-
gers, though distrustful of foreigners. They
are friendly toward each other, and the ties of
kindred are cherished with much affection.
The internal commerce of the islands is con-
siderable, for each atoll has its peculiar branch
of industry; in one the brewers reside, in
another the goldsmiths; locksmiths, mat mak-
ers, potters, turners, and joiners, each inhabit
exclusively their respective atolls. This divi-
sion of labor gives rise to a constant inter-
course and interchange of commodities, car-
r"
MALEBRANCHE

make voyages to Calcutta, Ceylon, Sumatra, the Malabar coast, and other distant parts, carrying cocoanuts, coir, mats, cocoanut oil, tortoise shell, dried fish, and cowries, or small shells, which pass as coin over all India. In return they bring home gold and silver, rice, tobacco, cotton and silk goods, and European articles.—The Maldives have been seldom visited by Europeans. The Portuguese touched at Male in the 16th century. In the beginning of the 17th a French merchant vessel was wrecked upon them, and one of the survivors, Pyrard de Laval, remained there nearly five years, and wrote an account of the islands, which was published in Paris in 1679. 

MALEBRANCHE, Nicole, a French metaphysician, born in Paris, Aug. 6, 1638, died there, Oct. 13, 1715. In his childhood he was feeble, and was educated at home with great care. Intended for the priesthood, he studied philosophy at the college of La Marche and theology at the Sorbonne, and in 1660 entered the congregation of the Oratory. But he wasured of theological and critical studies, and his philosophical vocation was determined by reading the Traité de l'homme of Descartes, which he accidentally met with, and which impressed him so strongly that his perusal was more than once interrupted by palpitations of the heart. From that time (1664) he devoted himself to philosophy, renouncing all other sciences except mathematics, aiming thus to enlighten his mind without burdening his memory. After ten years he produced his principal work, De la recherche de la vérité (Paris, 1674), which received numerous additions, and in its 6th edition (1712) extended to four volumes. It was translated into English by Richard Sault (2 vols. 8vo, London, 1692-14; 2d and 3d eds. by Thomas Taylor, fol., 1700 and 1720). In 1677 he published Conversations métaphysiques et chrétiennes, a discussion on the relation of philosophy to religion and Christian dogmas, which involved him in a long controversy with theologians and Cartesian metaphysicians, especially with Arnauld and Régis. In 1699 he was elected an honorary member of the academy of sciences. Withering slowly away, till he was hardly more than a skeleton, he died "a tranquil spectator of his own long dissolution." His later more important publications, partly philosophical and partly religious, were the Traité de la nature et de la grâce (1689); Méditations métaphysiques et chrétiennes (1683); Traité de morale (1684); Entretiens sur la métaphysique et sur la religion (1687); and Réponses de Malebranche à Arnauld (4 vols., 1709). A complete edition of his works was published at Paris in 1712, in 11 vols.—The philosophical system of Malebranche begins with the admission of the Cartesian doctrine that mind and matter are utterly opposed and mutually impermeable, the mind knowing nothing but its own states, which it sees in self-consciousness. It is like one in the dark, who can perceive nothing but himself. To this he added that we are able to see external objects in God, who is the light of our knowledge. He is the absolute substance, in whom exist alike the persons who know and the ideas which they know. He is the home of the world of ideas, as space is the home of physical bodies; and in him the mind knows objects other than itself. Malebranche recognized, with Descartes, three substances: the thinking, the extended, and the infinite substance, or the soul, matter, and God; but there is throughout his system a tendency to reduce them to one. In Descartes they describe excentric circles; in Malebranche they are concentric, including each other. Matter is grasped by the soul, and souls by the Deity; ideas enter the mind, the mind itself existing in God. Thus he marks the transition from Descartes to Spinoza, recognizing a personal God, but with pantheistic forms of thought, tending to reduce spirit and matter to one absolute substance. His most important works are contained in the edition by De Genoude (Paris, 1837), and in an edition by Jules Simon (2 vols., Paris, 1853). La philosophie de Malebranche, by Ollé-Laprune, received a prize from the French academy in 1872.

MALE FERN (aspidium filix-mas). Theophrastus and other ancient writers mention two kinds of fern, the male and female; whether or not this was the fern referred to as the male, it retains the name in common as well as in botanical nomenclature. There are something over a dozen aspidiums or shield ferns found in this country, some of which are very common, while a few, including the male fern, are exceedingly rare; this, while one of the common ferns of Europe, has thus far been found here only at Lake Superior. It has a large scaly root stock, from which arise the handsome fronds in a circular tuft, 2 to 3 ft. high and of the outline shown in the engraving; its elegant appearance makes it a desirable

Male Fern.
Malesherbes, the ancient as an anthelmintic, but attention was called to it anew by the widow of a Swiss surgeon, Mme. Nourier, who had such great success in expelling tapeworms that Louis XIV, paid her 18,000 francs for her secret; it was found that her principal remedy was the root of the male fern, which was aided by powerful purges. The root stocks are collected when 3 to 6 in. long and dried, in which state they are kept in the shops; the male fern roots, as they are called, contain about 10 per cent. of oily and resinous matters, upon which their worm-destroying properties depend; the oil of male fern is an ethereal extract, and contains such constituents of the roots as are soluble in that menstruum. Like other agents for the destruction of tapeworms, it has had a varying reputation, some attributing its efficacy solely to the active cathartic properties used with it; on the other hand, it is asserted that while it is effective against the unarmed tapeworm, common among the Swiss, it has much less or very little effect upon the armed tapeworm, the one most common in this country. The medicine appears to act as a poison upon the worm, which is then easily expelled. The dose of the powdered root is two or three drams, or of the oil half a dram, followed by castor oil.

Malesherbes, Christiau Guillaume de Lamoligon de, a French statesman, born in Paris, Dec. 6, 1721, guillotined April 22, 1794. Of an illustrious family, son of a chancellor of France, he was educated in the Jesuits' college, became counselor of the parliament of Paris in 1744, succeeded his father in the presidency of the court of aids in 1750, and was at the same time appointed superintendent of the press. He favored the publication of the Encyclopédie and other works of its authors in defiance of the anathemas of the Sorbonne. He protested in 1779 and 1771 against the imposition of new taxes and the abuses of lettres de cachet, for which he was banished from Paris. After the accession of Louis XVI, in 1774, he was called into the ministry with Tarrogot, and the department of Paris and the police of the kingdom was intrusted to him. His counsels were rejected, and he resigned in 1776 when Tarrogot was dismissed. He passed the time until the revolution in travels in France, Holland, and Switzerland, and in the pursuits of literature, with the exception of a brief interval in 1787 when he was called into the ministry. When Louis XVI, was arraigned before the national convention in 1792, Malesherbes obtained the dangerous honor of pleading his cause, and was one of the last to take leave of the condemned monarch. Eleven months afterward he was arrested with his family by the revolutionary tribunal, and condemned with them to the scaffold. His Discours et remarques (1779) are valuable with reference to financial questions, and his paper Sur la liberté de la presse (1809) is remarkable for its enlightened views. A monument was erected to his memory under the restoration.—See Boissy d'Anglas, Essai sur la vie, les opinions et les écrits de Malesherbes (2 vols., 1818), 1867. Sainte-Beuve, Malesherbes, in Conscrits du lendemain, vol. ii.

Malet, Claude François de, a French conspirator, born in Dôle, June 28, 1754, executed in Paris, Oct. 20, 1812. In 1799 he distinguished himself in the army during the passage of the Little St. Bernard, and was made brigadier general. He disapproved of the promotion of Bonaparte to the consulate, but apparently adhered to the empire, expressing in a letter to Napoleon a hope of its becoming beneficial to and not destructive of liberty. But Prince Eugène expelled him from his headquarters in Italy, on the charge of conspiring against the emperor, and he was imprisoned during ten months till May, 1808, and soon rearrested. In prison he continued to plan conspiracies with other opponents of Napoleon, especially in 1809, after the defeat at Essling, but this attempt was abortive. The emperor ordered him to be transferred from La Force to a regular state prison, but Fouché neglected to do so, and even permitted him in June, 1812, to remove to a private sanitary asylum. Here he met the Polignacs and Abbé Lafon, the principal Bourbon agents, while his wife, the corporal Rateau, and others worked against Napoleon in the interior of the country. Malet's plot was ripe in October, when he deemed the anxiety respecting the Russian campaign favorable for its execution. In the night of Oct. 23-24, when the disasters retreat from Moscow became known, he announced to the garrison of Paris the death of Napoleon, and at first met with some success, with the aid of his confederates, and by promising rewards to those who would join him. He shot dead the recalcitrant Gen. Hullin, commander of the first division, but was disarmed by two officers, who disclosed the deception which had been practised, and the populace responded with the cry, Vive l'Empereur. The whole plot fell to the ground, and Malet was sentenced to death.

His wife was arrested; and as she subsequently received a pension, and her son an appointment, from Louis XVIII, it was supposed that Malet had conspired in the interest of the Bourbons, but it is generally believed that he was a sincere republican.

Malet, François de, a French poet, born in Caen in 1555, died in Paris, Oct. 16, 1628. While young he studied at Heidelberg and Basel, and afterward bore arms in the wars of the league. He acquired some reputation in 1608 by an ode on the arrival in Florence of Maria de' Medici. In 1605, having gone to Paris on business, Henry IV, sent for him, praised his talents, and provided him with the means of remaining at court. After the death of Henry IV, his widow, Maria de' Medici, settled on Malherbe a pension of 500 crowns, "in gratitude for the ode addressed to her." He
was noted for his aversion, his pretended contempt of poets, his fondness for female society, his wit, and his dilettantism in language. He wrote for the most part light lyrics, odes, stanzas, epigrams, sonnets, and a few devotional pieces. The latest edition of his works is that of M. L. Lalanne (4 vols., Paris, 1865).

MALIBRAN, Maria Felicia, a Spanish singer, born in Paris, March 24, 1808, died in Manchester, England, Sept. 23, 1836. She was the eldest daughter of the singer and instructor Manuel Garcia, by whom she was taken when nine years old to England, where she remained for a number of years. Her father instructed her in singing, and by her 17th year she had acquired so great a facility that on June 7, 1825, she was enabled to make her début in London as Rosina in the Barbiere di Siviglia, on the occasion of the sudden departure of Mme. Pasta, who was to have undertaken the part. She sang with success in other operas and at private and public concerts in London, Manchester, and Liverpool, during the same season, giving promise of great future eminence; and in the autumn of 1825 she accompanied her father to the United States as prima donna of an opera company of which he had assumed the direction. She appeared in New York, Nov. 29, in the part of Rosina, the occasion being memorable in musical annals as that which witnessed the introduction of the Italian opera into the United States. Her reception was enthusiastic, and she appeared successively in a number of parts, each of which subsequently became a perfect creation in her hands. In the midst of her triumphs she was married, March 23, 1826, to Eugène Malibran, an elderly French merchant of New York, reputed to be possessed of considerable wealth. He afterward failed, and Mme. Malibran, offended by the readiness with which her husband sought to retrieve his fortunes by her professional labors, surrendered to her creditors the property settled upon her as a marriage dowry, and in September, 1827, returned alone to Europe. From Jan. 14, 1828, when she made her first appearance before a Parisian audience, until the close of her life, her career was prosperous and brilliant. She was accustomed to spend the winter in Paris and the spring and autumn in England and the larger continental cities; and on two occasions she made professional tours to Naples, Milan, and other Italian cities. The French courts having in 1835 pronounced her marriage with M. Malibran void, she was married, March 29, 1836, to De Périot, the celebrated violinst. In April following she was injured by a fall from her horse; but professing to make light of the matter, she appeared in opera in Brussels and at Aix-la-Chapelle during the summer. In September she went to the Manchester musical festival, and, contrary to the advice of her physician, took part in the performances. A nervous fever set in, which soon proved fatal. —Mme. Malibran was one of the first singers of the age, and her dramatic ability was scarcely less remarkable than her vocal. Her voice, a mezzo-soprano approaching a contralto, of great volume and purity, had been brought to almost absolute perfection by the severe training of her father; and in the variety and beauty of her vocal embellishments, as well as in the felicity and dramatic propriety with which she interpreted her music, she has rarely been equalled. Her range included some of the finest rôles, both tragic and comic, in the operas of Rossini, Bellini, and Mozart, including those of Rosina, Semiramide, Tancredí, Desdezona, Romeo, Zerlina, Ninetta, Cenerentola, and Amina. She also sang with wonderful effect the sublime music of Handel's oratorios, and many choice selections from Gluck and others. Her personal qualities accorded with her lyrical genius, and few women have been more beloved for their amiability, generosity, and professional enthusiasm. Her benefactions amounted to such considerable sums that her friends were frequently obliged to interfere for the purpose of regulating her finances. Her intellect was of a high order, and the charm of her conversation fascinated all who were admitted into the circle of her intimate friends. She was also an accomplished linguist, speaking fluently and singing in the chief languages of Europe. She composed several songs, nocturnes, and romances, some of which have been published. A memoir of her, by the countess of Merrip (2 vols.), appeared in England soon after her death, and was republished in the United States.

MALLARD. See Duck.

MALLE, Charles Auguste, a French philosopher, born in Lille, Jan. 1, 1807. He studied at the normal school, and was professor in various colleges of the interior till 1842, when he was called to the collège St. Louis in Paris. From 1848 to 1850 he was inspector of the academy of Paris, and afterward rector of the academy of Rouen, retiring in 1852. His principal works are: Études philosophiques (2 vols., Paris, 1837–8; 2d ed., 1849); translation of Beattie's 'Elements of Moral Science' (2 vols., 1840); Histoire de la philosophie ionienne (1842); Histoire de l'école de Mégare et des écoles d'Élée et d'Étrurie (1845); and Éléments de morale (1864).

MALLET, David, a Scottish author, born at Crieff, Perthshire, about 1700, died in London, April 21, 1765. His original name was Mallow, which he changed to Mallet in 1726. He was educated at Aberdeen, and settled in London as a literary man. In 1733 he published a poem entitled "Verbal Criticism," which so pleased Pope that he introduced him to Bolingbroke, who obtained for him the office of under secretary to Frederick, prince of Wales, with a salary of £200. From the Newcastle administration he got a pension, said to have been the reward of his attacks on Admiral Byng. His pen was always at the service of those who
would pay for it, not sparing even his old friend Pope, whom after his death, at the instigation of Bolingbroke, he assailed in his preface to that nobleman’s “Idea of a Patriot King.” Bolingbroke made him his literary executor, and the duchess of Marlborough left by her will the sum of £1,000 to Glover and Mallet jointly, provided they drew up from the family papers a life of the great duke. Glover declined, but Mallet accepted, and on pretence of being engaged upon the work received for the rest of his life a pension from the second duke. On his death, however, it was found that he had never written a line of it. A collection of Mallet’s works was published by himself (3 vols., 1750). A new edition of his songs and ballads, by Frederick Dinsdale, appeared in 1867.

Mallet, Paul Huard, a Swiss historian, born in Geneva, Aug. 29, 1730, died there, Feb. 8, 1807. After completing his education he went to Copenhagen, where he was appointed regius professor of belles-lettres in 1752. He employed his leisure in studying the language, history, and archeology of the ancient Scandinavians, and wrote his Introduction à l’histoire de Danemark (Copenhagen, 1755–6). In 1760 Mallet returned to Geneva, and filled the chair of history in the college of that city for four years. The most important of his works, besides that above named, are: Histoire de Danemark (3 vols. 4to, Copenhagen, 1755–77); Mémoires sur la littérature du nord (6 vols. 8vo, Copenhagen, 1759–60); Histoire des Suisses (4 vols. 8vo, Geneva, 1803); and Histoire de la ligue Hébertiste (Geneva, 1805). His Introduction à l’histoire de Danemark was translated into English by Bishop Percy, under the title of “Mallet’s Northern Antiquities” (2 vols. 8vo, London, 1770; new ed., by I. A. Blackwell, 1 vol. 12mo, 1847).

Mallow, a common name for plants of the genus Malva (from Gr. mallow, to soften, in allusion to their softening and emollient properties). The genus, as at present restricted, includes about 16 species, none of which are indigenous to this country, though several of them are more or less extensively naturalized; it is the type of the natural order Malvaceae, which comprises many kindred genera distinguishable mainly in the structural differences of the fruit, but all agreeing in having their stamens united into a tube by their filaments, and in having one-celled anthers; about 700 species are known, distributed among 59 genera. It is remarkable that none of the order possesses any unwholesome qualities, while all abound in mucilage. The wild or high mallow (M. sylvestris) is a handsome biennial, with an erect stem and kidney-shaped leaves having five to seven deeply crenate lobes; the flowers are large, of a purple or a rosy color, the calyx hairy, the carpels wrinkled. It grows on waste places and roadsides in Europe, and is an introduced and naturalized weed in the older portions of this country. For fomentations and poultices, its properties are not inferior in value to those of the marsh mallow (see Albica), and decoctions of its leaves have been used in dysentery and urinary troubles. This is the mallow of the French, who use the dried flowers in preparing a tisane, or diet drink, which is in great repute with them;

The name mallow is also applied to a dye resembling the flowers of this plant in tint. By far the most common with us is the familiar weed known as common or dwarf mallow (M. rotundifolia), so abundant by the wayside, in rich shaded doorways, and cultivated grounds generally. Its stems are prostrate, spreading, and spring from a long, deeply buried root; its leaves are round-heart-shaped, somewhat lobed and crenate on their edges; the flowers small, whitish, with purplish veins. The plant is much prized by children, who in play seek its flat and circular mucilaginous fruits under the name of “cheeses.” The musk mallow (M. moschata) is a low perennial, sometimes cultivated in gardens, from which it has to some extent escaped, and is occasionally found naturalized along waysides; it has handsome, deeply cut leaves, diffusing a pleasant, musky fragrance, and large rose-colored or white flowers. The curled mallow (M. crispa) is likewise seen in old gardens, conspicuous for its large, strong, tall stem, and rich, deep green, singularly curled foliage, the beauty of which supplies the defect of its flowers, which are rather inexpressive. The hollyhock mallow (M. Alcea), a European perennial species about 3 ft. high, with palmately five-cleft leaves and rosy-purple flowers 2 in. across, is cultivated and has become naturalized in some parts of Pennsylvania. The American species formerly placed in malva are mostly now in the genus Malvastrum.—There are many very showy flowers belonging to the order Malvaceae, such as those of Lavatera, Malope, Aubotin, and Sida, prized in border and greenhouse cultivation.
MALMAISON, La, a village of France, in the department of Seine-et-Oise, about 7 m. W. of the enceinte of Paris, noted for a palace which became celebrated through Josephine, the first wife of Napoleon I. The Norman pirates committed ravages in this vicinity in the 9th century, and the locality was hence called *mala mansio* ("evil spot"). In the 17th century it was owned by Christophe Perrot, councillor of the parliament of Paris, styling himself lord of Malmaison. Afterward it had various proprietors; and from Mme. Harené, who received here many literary and scientific notabilities, it passed into the possession of M. Le Couteux, who in 1798 sold the domain to Josephine for 160,000 francs. She made it a brilliant centre of fashionable and intellectual society, enlarging and embellishing the grounds after the model of Marie Antoinette's Trianon, furnishing it with a good library, and adding many fine pictures and other works of art to the collections. The château itself, however, retained a rather unseemly appearance. Bonaparte often resided here previous to his removal to St. Cloud, and Malmaison preserved great prestige until the establishment of the empire in 1804. After her divorce (Dec. 16, 1809) Josephine kept up here the semblance of a court, and she was frequently visited by Napoleon, who also spent several days here with Hortense after the battle of Waterloo. The emperor Alexander, as well as the king of Prussia and his son, visited Josephine at Malmaison, on the first occupation of Paris. After her death here (May 29, 1814) the property reverted to her son, Eugène de Beauharnais. The Swedish banker Hauergman purchased it in 1826, reducing the grounds to their original small dimensions. He sold it in 1842 to the dowager queen Maria Christina of Spain for 500,000 francs, and she resold it in 1861 for 1,500,000 francs to Napoleon III., who had it restored. Among the works which he collected here is Isabey's painting of "Bonaparte at La Malmaison," Hortense's portrait of herself, and a portrait of Josephine. The room which Napoleon used to occupy contains the bed on which he died at St. Helena.

MALMESBURY, a parliamentary borough of Wiltshire, England, on the Avon, which is here crossed by six bridges, 82 m. W. of London; pop. in 1871, 6,880. Formerly the manufacture of woollen cloth was the chief branch of industry, but it has given way to wool-stapling. The parish church is a portion of a famous old Saxon nunnery, and contains a tomb reputed to be that of King Athelstan. The town is the birthplace of the philosopher Hobbes.

MALMESBURY. I. James Harris, first earl of, an English diplomatist, born in Sommersetshire about 1695, died at Malmesbury about 1148. He was destined for the church, and early entered the monastery of Malmesbury, of which he became librarian. Several of his numerous works were published by Sir Henry Savile in 1596, in his *Scriptores post Bedam*. His "History of the Kings of England" and "Modern History" (*De Gestis Regum et Historia Novella*), the former translated by the Rev. John Sharpe (London, 1815), were reprinted in 1847 in Bolin's "Antiquarian Library."

MALMÖ (Swedish, *Malmöhus*). I. A län or province of Sweden, bordering on Christianstad, the Baltic, and the Sound; area, 1,852 sq. m.; pop. in 1873, 32,175. It is one of the most fertile portions of Sweden, rears the best horses and cattle, and produces excellent cheese and great quantities of grain. It contains several lakes, of which the largest is Lake Ring. II. A city, capital of the län, on the Sound, 16 m. S. E. of Copenhagen; pop. in 1873, 27,485. It consists of the town proper and two suburbs, which are separated by Warn, connected with it by a canal. The streets are spacious, and the market place is planted
MALT

with trees. The former fortifications have been converted into promenades. The ancient castle of Malta is used for barracks, and for a prison and penitentiary. Two churches, the old town hall, and the theatre are among the conspicuous buildings. There are a gymnasium and schools of technology and navigation. Among the charitable institutions is a richly endowed lunatic asylum. Steamboats, railways, and especially the improvement of the harbor, have greatly promoted the maritime and commercial importance of Malmo. About 5,000 vessels enter and leave the port annually. The principal export is grain.

MALSEY. See Greece, Wines of.

MALPIGHI, Marcello, an Italian anatomist, born near Bologna in 1628, died in Rome, Nov. 29, 1694. In 1656 he was appointed by Ferdinand II. of Tuscany professor of medicine at Pisa, where he made the acquaintance of the celebrated mathematician Borelli, who first convinced him of the propriety of applying experimental researches to the elucidation of physical science. Ill health, however, soon compelled his return to Bologna, where he continued to practise as a physician till 1662, when he was called to a professorship at Messina. In 1661 he was invited to Rome by Innocent XII., who appointed him his chief physician and chamberlain. His reputation is mainly due to the fact that he was the first to employ the simple microscope, then recently invented, in investigating the anatomical structure of plants and animals, and particularly upon his discovery by this means of the capillary circulation of the blood from the arteries to the veins. Harvey had already in 1628 demonstrated the circulation of the blood as a whole; that is to say, the return of the blood which had passed out from the heart by the arteries back again to the heart by the veins. The mode in which the blood passed through the substance of the tissues, from the arteries to the veins, was however still unknown; and no doubt it was partly this fact which prevented the ready acceptance of Harvey's doctrine by the anatomists of the time. But in 1661 Malpighi saw with the microscope the circulation of the blood through the capillaries in the frog's lung, and afterward in the mesentery; thus demonstrating its passage by minute canals from the arteries to the veins, and supplying the only deficiency which had existed in Harvey's discovery. His name has been perpetuated in that of several anatomical textures discovered and described by him, viz.: the rete Malpighianum of the epidermis, the Malpighian bodies of the spleen, and the Malpighian tufts of the kidney. His principal works are: Observationes Anatomicae de Pulmonibus (fol., Bologna, 1661); De Vincero, Structura Exercitationes Anatomicae (1666; many times reprinted and translated into French); Dissertatio Epistolica de Formatione Pulli in OvO (London, 1673); Dissertatio Epistolica de Bombye (London, 1669); De Pulmonum Substantia et Motu (Leyden, 1672); Anatomie Plantarum (London, 1678-79); and Epistola de Glanulis Conglobatis (London, 1689). The only complete collective edition of his works was published at Venice in 1748.

MALPLAQUET, The vicomte de, in the department of Le Nord, 10 m. S. by W. of the Belgian town of Mons, celebrated for a battle between the allied forces under Marlborough and Prince Eugene, and the French under Marshal Villars, Sept. 11, 1709. The battle commenced at 8 o'clock in the morning, the principal attack of the allies being directed upon the enemy's left, where Villars himself held command. The French at first repelled their assailants, but Villars having become disabled by a wound, the allies succeeded in forcing the position; and the French, in spite of desperate efforts by the new commander, Boulangers, and the chevalier St. George, succumbed, though they effected their retreat in good order. In this battle, the bloodiest in the war of the Spanish succession, the allies, who brought into the field 80,000 men and 140 guns, lost in killed and wounded more than 20,000 men; the French, who numbered 70,000 men with 80 guns, lost more than half that number; but some accounts place the loss on both sides as high as 42,000. During the battle Marlborough exposed himself to frequent perils, and the report of his death, which was at one time prevalent in the French ranks, gave rise to the once popular military refrain: Malbrook on va ten guerre, which was reproduced from a song of the 16th century on the death of the duke of Guise.

MALT. See Brewing.

MALTA (anc. Melita), a British possession in the Mediterranean, including the islands of Malta, Gozo, and Comino, and the uninhabited islets of Cominotto and Filfa, the entire group lying between lat. 35° 43' and 36° 5' N. and long. 14° 10' and 14° 53' E., about 60 m. S.W. of the southernmost point of Sicily, and
in ancient times the medium of conversation of the higher classes, as English is at the present day. The present common language is the lingua franca, a patoia of the Arabic, mixed with Italian and other languages. The complexion of the Maltese is almost as dark as that of the natives of Barbary. The dress of the working classes is a short loose waistcoat, covering a cotton shirt, short loose trousers, woolen caps in winter and straw hats in summer, and a kind of sandals resembling those of the ancient Romans. The women are of dark complexion, and are small, delicate, and generally graceful, and wear in the streets a black veil (faldetta). The dress consists mostly of a cotton shift, blue striped petticoat, a corset with sleeves, and a loose jacket covering the whole. Drunkenness is almost unknown, and the people, although coarser in their appearance, are less vindictive and impulsive than other races of southern Europe. They are fond of poetry, especially in the rural districts, where the taste for verse is particularly prevalent. In music they prefer noisy instruments, as the tambourine, mandoline, and particularly the bagpipe, which accompanies the national dances. They marry at an early age. Many of them seek employment in the Levant, where they are however exceedingly unpopular on account of their crafty and treacherous nature, and they are generally employed only in the meanest labors. The families ennobled by the knights of Malta have dwindled down to a small number; and the few which remain are not very affluent. The national religion is Roman Catholic, under the direction of a bishop and more than 1,000 priests, the church property being considerable. The number of Protestants is about 5,000, whose places of worship consist only of a few chapels. Education is promoted by the university of Valetta, colleges at Città Vecchia and several other places, and about 50 public and 100 private schools. The value of imports paying duty in 1871 was $37,400,000; of exports, $87,600,000. The number of steamers arrived in 1871 was 1,737, tonnage 1,466,000; of sailing vessels arrived, 2,954, tonnage 519,000; total number of vessels, 4,691, tonnage 1,985,000. The direct trade with the United States is inconsiderable, but a large number of American vessels are engaged in the trade of foreign countries with Malta. A new government grading dock, capable of receiving the largest men-of-war, has been recently opened, and new submarine telegraphs have been laid connecting Malta with Algiers and Alexandria. The hydraulic lift dock, completed in 1875, is of great benefit to commerce, especially to the steamers of the India route, as by means of it vessels can be repaired without discharging their cargo. The revenue in 1870 was £158,630; expenditures, £171,788; public debt, £79,202. —Malta is a crown colony, the local government being conducted by a governor who is
as at the same time commander-in-chief, assisted in legislative matters by a council of 18 members, of whom 10 are official and 8 elective. The British troops and their families in December, 1872, numbered 6,752 persons. The duties of the native regiment, called the Malta fencibles, are exclusively local, and their maintenance is defrayed out of the revenues of the islands. The central position, military strength, and excellent harbor, one of the most commodious and convenient in the Mediterranean, render the possession of Malta of great importance to Britain, and make it very advantageous for the accommodation and repair of the men-of-war and merchant ships frequenting the Mediterranean. The storehouses or cariottori for grain are excavated in the rock, making Malta an excellent centre of the corn trade between the Mediterranean and Black seas.—Besides Valetta and Città Vecchia, and a few other towns, Malta possesses about 40 casals or hamlets, chiefly remarkable for their picturesque arches. The former capital of Malta was Città Vecchia. The present capital, Valetta, is one of the best fortified places in the world, and serves as a station for the Mediterranean fleet. The ancient Melita was important as a commercial centre among the nations of antiquity, and it was occupied probably at a very early period by a Phoenician colony. Afterward it became a Carthaginian settlement. At a later period it appears to have been in a measure Hellenized, though there is no historical evidence of its having been in the possession of the Greeks. In 237 B.C. it was ravaged by a Roman fleet under Attilius Regulus; and surrendering to the Romans at the beginning of the second Punic war, it was annexed to the province of Sicily. It became notorious as a resort of the Cilician pirates, but was in a flourishing condition in the days of Cicero, who during periods of disturbance entertained the project of retiring thither. The Maltese cotton fabrics (reatis Melitensis) were in great demand in Rome, and they were probably manufactured from the cotton which still forms the principal product of the island. In sacred history Malta is celebrated as the supposed scene of the shipwreck of St. Paul on his voyage to Italy (A.D. 60); though according to some critics Melita (now Meleda) in the Adriatic, on the coast of Dalmatia, was more probably the island visited by the apostle. After the fall of the Roman empire the island was for some time in the possession of the Vandals, but was taken from them by Belisarius (533), and was subject to the Byzantine empire until the latter part of the 9th century, when it was conquered by the Arabs. It was wrested from them at the close of the 11th century by Count Roger, the Norman conqueror of Sicily, and it was united with Sicily until the early part of the 16th century, when Charles V. took possession of that country and of Malta as heir of Aragon. Under this emperor the knights of Malta (see SAINT JOHN, Knights of) became its sovereigns, and held it till 1798, when the French expedition to Egypt under Napoleon seized the island. After the battle of the Nile the inhabitants rose in insurrection and compelled the French to shut themselves up in the fortress of Valetta. They were subjected to a stringent blockade until Sept. 5, 1800, when, reduced by famine, they surrendered to the English, who had come to the assistance of the Maltese. The island has since remained under British rule.

MALTE-BRUN. 1. A Danish geographer, whose actual name was MALTHE CONRAD BREUX, born at Thisted in Jutland, Aug. 12, 1779, died in Paris, Dec. 14, 1826. He studied in Copenhagen, devoting himself especially to literature and politics. He embraced republican principles, and in 1795 published a pamphlet entitled "Catechism of the Republicans," for which he was prosecuted by the government and obliged to take refuge in Sweden. A poem on the death of Bernstorff which he published during his exile procured for him permission to return to Denmark. But another pamphlet against the aristocracy subjected him to a new prosecution, and he left his country, and finally took up his residence in Paris. In December, 1800, the Danish courts pronounced sentence of perpetual banishment against him, which was rescinded about the time of his death. In Paris he wrote largely for various journals, and in 1806 became one of the principal writers for the Journal des Débats. He at first opposed the consular government, but subsequently became a zealous imperialist, and after the fall of Napoleon an equally zealous monarchist, publishing in 1824 Traité de la légitimité considérée comme base du droit public de l'Europe chrétienne. In the mean time he devoted himself especially to geographical studies, and in 1808, in conjunction with Montelle and Iberlin, commenced the publication of Géographie mathématique, physique et politique, which was completed in 1807, comprising 16 volumes. In 1808 he established the periodical Annales des Voyages, which was discontinued in 1814, and resumed in 1819, with the collaboration of Eyriès, under the title, Nouvelles Annales des Voyages, and is still issued under charge of his son. He was one of the founders of the geographical society, of which he became secretary. He wrote a number of miscellaneous works, among which is a posthumous collection, Milanges scientifiques et littéraires (3 vols., 1828). His most important work is Précis de géographie universelle (8 vols., 1810—23, the last two volumes being by Huot). This has been several times republished, the last edition by Lavallée (6 vols., 1856—78). It was translated into English, and an edition published at Boston, with notes and additions by James G. Percival (3 vols. 4to, 1828—32), and one at Philadelphia (5 vols. 8vo, with atlas, 1832—7). II. VICTOR ADOLPHE, a French geographer, son of the preceding, born in Paris in 1816. After having been profes-
MALTHUS

sor of history in several colleges, he devoted himself especially to geographical studies. He is secretary of the geographical society, and principal editor of the * Nouvelles Annales des Voyages*, and has published numerous works relating to geography. Among these are: *Jeunes voyageurs en France* (1840); *Destinée de Sir John Franklin dévoilée* (1860); *Nouvelles acquisitions des Russes dans l’Asie orientale* (1861); *Les États-Unis et le Mexique* (1862); *Coup d’œil sur la Yucatan, and Sonora et ses mines* (1864); *Canal interoceânique du Darien* (1865); *Histoire de Marcoussis* (1867); and *Histoire géographique et statistique de l’Allemagne* (4to, 1866–8). He has also issued a revised edition of his father’s geography (8 vols., 1852–5), and, in conjunction with others, *France illustrée* (3 vols., 1855–7).

**MALTHA** (Gr. μαλθα, soft wax; also denoting a mixture of wax and pitch, used for the surface of writing tablets, and for some kinds of cement). Pliny describes under this name an inflammable mud flowing from a pool at Samosata, on the Euphrates, which he says was similar in nature to naphtha; and this use of the word has led to its later application to viscid bitumens. It is the proper name for mineral tar, or all bitumens having the consistency of tar, and holding water and air in mechanical admixture in consequence of their viscosity. It occurs on the surface of the ground and issuing from springs, often accompanied by water, in various parts of the world, but most frequently in localities noted for the production of petroleum, for which substance maltha is frequently mistaken. It appears to be a product of the partial oxidation or decomposition of certain unstable varieties of petroleum, and doubtless in all cases has a common origin with it (see *PETROLEUM*), as it passes by insensible degrees into petroleum on the one hand and asphaltum on the other. It is found in this country throughout the length of California, in Texas, and at various places in the southwest, on both flanks of the Rocky mountains, and in Alaska. Among foreign localities may be mentioned Enniskillen in Canada, the islands of Barbadoes and Trinidad, many localities in South America, some of the islands of the Grecian archipelago, and the Caucasus. In California, where there are immense quantities of this material, it occurs in every variety of density, from 0·94 to 1. In consistence it varies from that of a thin sirup to that of soft mortar. It issues there from a stratum of shale of considerable thickness which occurs in the miocene sandstones of the Coast range. It oozes from springs upon hillsides, over which it trickles; it accompanies water in pools, and flows upon the surface of streams. It has been obtained from artesian borings at a depth of more than 450 ft., of the consistence of tar, and at a depth of 117 ft. so tenacious as to prevent the drill from penetrating further. In a few localities in this region the maltha is mixed with sand, the mixture forming strata or beds of great extent. At Enniskillen the maltha forms what are known as “gum beds.” Barbadoes tar was long an article of commerce, used in medicine as a liniment. The California malthas have been used to some extent as a crude material for the manufacture of kerosene; but they have not been found to possess much value for this purpose when treated in the same apparatus as is used for petroleum; when it is distilled under pressure, or “cracked,” a better result is obtained both as regards yield and quality.—Little is known regarding the chemical constitution of maltha; but it is without doubt a mixture of hydrocarbons more dense than those found in petroleum. Some specimens contain nitrogen, as is proved by the fact that maggots are developed in immense numbers in pools of this substance. It is also possible that oxygen is a constituent of some varieties. While this substance is widely distributed and occurs in vast quantities in some localities, it is at present very much less valuable than petroleum. It is readily distinguished from it by its greater viscosity and its tendency to froth when heated, the froth often occupying 20 times the bulk of the maltha at the temperature of boiling water.

**MALTHUS, Thomas Robert,** an English political economist, born at Albury, Surrey, in 1766, died in Bath, Dec. 29, 1834. His father was a gentleman of fortune, interested in classical and philosophical studies, and so intimate a friend of Rousseau that he was appointed one of his executors; and David Hume was likewise among his friends. In 1784 he was admitted to Jesus college, Cambridge, and became one of the first classical scholars. He received his master’s degree and a fellowship in 1797, entered holy orders, and divided his time between the care of a small parish in Surrey and his studies in Cambridge. In 1798 he published anonymously the first edition of his work on population, which was subsequently much enlarged and modified. The title of the sixth and last revision (1826) is: “An Essay on the Principle of Population, or a View of its past and present Effects on Human Happiness, with an Inquiry into our Prospects respecting the future Removal or Mitigation of the Evils which it occasions.” His object at first was to refute the theories of Condorcet and Godwin on human perfectibility and political optimism, by showing the necessary sufferings of the poor from the tendency of population to increase faster than the means of subsistence. The condition of the poor became the prominent feature of the subsequent editions. In 1799 he visited Sweden, Norway, Finl, and Russia, collecting facts and documents in illustration of his subject; and during the interval of peace in 1802 he explored France and Switzerland. He married in 1806, and was appointed professor of history and political economy in the East India college at Haileybury, which post he held till his death. His other principal writings are: “Observations on the Effects of the Corn Laws” (3d ed., 1815); “An Inquiry into the Nature and Pro-
gress of Rent" (1815); "Principles of Political Economy" (1829); and "Definitions in Political Economy" (1827).—His reputation rests almost exclusively upon the views advanced in his work on population. He held that population, when unchecked, increases in a geometrical ratio, while food can be made to increase at furthest only in an arithmetical ratio. Powerful checks on population must be constantly in action, which may be resolved into vice, misery, and moral or prudential restraint.

MALTITZ, Apollonius von, baron, a German author, born in Königsberg in 1795, died in Weimar, March 2, 1870. He was a brother of the poet Franz Friedrich von Maltitz (1794-1857), and like several of his relatives he was employed in the diplomatic service of Russia, representing that empire at Weimar from 1841 to 1865. He published novels, poetry, dramas, tragedies, comedies, and an autobiography (1863). His best known tragedies are "Virginia" (1855), Anna Boleyn (1860), and Spartaus.—Another distinguished poet of the same family was Gottfried August von Mal- titz (1794-1837).

MALTZAN, Heinrich Karl Eckardt Hellmuth, baron of Wartenburg and Penzlin, a German traveller, born in Dresden, Sept. 6, 1826, died in Pisa, Italy, Feb. 22, 1874. He studied at several German universities, made explorations in north Africa, Arabia, and other countries, and published "Drei Jahre im Nordwesten von Afrika" (4 vols., Leipzig, 1863; 2d ed., 1868); "Walfahrt nach Mekka" (2 vols., 1865); "Reise auf der Insel Sardinen" (1866); "Sittenbilder aus Tunis und Algerien" (1869); "Reise in den Regenschaten Tunis und Tripolis" (3 vols., 1870); and "Reise nach Sädirabien" (Brumswick, 1872). He was a high authority in Phoenician and old Egyptian archaeology, and in S. Arabian geography, ethnology, and philology.

MALUS, Etienne Louis, a French engineer and physicist, born in Paris, June 23, 1775, died there, Feb. 23, 1812. He belonged to a distinguished family, and his intellectual preciosity manifested itself while he was at school in the composition of an epic poem and of two tragedies. At the same time he was proficient in mathematics, and passed a brilliant examination as a military engineer. In 1793 he received the rank of sub-lieutenant, but as the school of Mézières which had conferred it was closed, he enlisted as a volunteer, and exhibited so much talent while employed on the fortifications of Dunkirk, that he was sent as a pupil to the newly established polytechnic school, which he left in 1796 with the grade of sub-lieutenant; and next year he entered the army as captain. He distinguished himself at the capture of Malta and of Jaffa, where he narrowly escaped losing his life by the plague. He was among the earliest members of the Egyptian institute, and in 1799 he was made by Kléber chief of battalion. Shortly after his return from the East he married the daughter of Chancellor Koch, of the German university of Giessen, whose acquaintance he had made while formerly stationed there. In 1804 he was commissioned by Napoleon to draw up plans for the enlargement of the harbor and fortifications of Antwerp, and he subsequently superintended the reconstruction of the fort at Kehl, opposite Strasburg. In 1810 he became mayor, member of the academy, and examiner at the polytechnic school, and next year provisional director of that institution. His chief publications include a mathematical "Traité d'optique," first published in 1810, in which he promulgated some valuable discoveries respecting the refraction of light in transparent media; and the "Theory of Double Refraction" ("Mémoires présentés à l'Institut," vol. ii.), containing an account of his discoveries respecting the polarization of light, and showing that light may acquire properties identical with either of two rays yielded by refraction through Iceland spar by the process of simple reflection at a particular angle from any transparent body. This famous memoir received an academical prize at the suggestion of Laplace. He also published an "Essay on the Measurement of the Refractive Force of Opaque Bodies;" "Remarks on some new Optical Phenomena," intended to prove that two portions of light are always polarized together in opposite directions; a paper "On Phenomena accompanying Refraction and Reflection," and one "On the Axis of Refraction of Crystals."

MALVERN, Great, a town of Worcestershire, England, celebrated as a watering place, on the E. side of the Malvern hills, 8 m. S. W. of Worcester; pop. in 1871, 7,825. The springs, which are sulphurated and slightly tepid, are especially beneficial in glandular and skin complaints. They are situated between Great and Little Malvern, the latter place being 4 m. S. of the former, which is surrounded by fine country residences and contains delightful walks and good accommodations for bathers and visitors. There are several schools, an excellent library and reading room, and a chapel of the countess of Huntingdon's connection. The ancient church, formerly part of a monastery founded by Edward the Confessor, is one of the finest specimens of Gothic architecture in England. The Malvern hills, which reach a height of about 1,400 ft., extend about 9 m. N. and S.

MALVERN HILL, Battle of. See Chickahominy.

MALVOISINE, or Mawmoisine, William de, a Scotch ecclesiastic, died July 9, 1238. He was educated and perhaps born in France, but was at an early age archdeacon of St. Andrews. In 1199 he became chancellor of Scotland, in 1200 bishop of Glasgow, and in 1202 bishop of St. Andrews, retaining the latter see until his death. In 1211, as papal legate, in concert with the bishop of Glasgow, and at the request of the pope, he convened a council of the clergy and people at Perth to urge an expedition to the Holy Land. In 1214 he officiated at the
MAMELUKES

Coronation of Alexander II., and from 1215 to 1218 attended the fourth Lateran council as one of the representatives of the Scottish church. He was a zealous churchman, and, according to Fordun, was equally zealous in support of his personal rights, having deprived the abbey of Dunfermline of the presentation to two livings because its monks had once neglected to provide him with wine for supper. He introduced new monastic orders into Scotland, established many Dominican and other convents, and wrote the lives of St. Ninian and Kentigern.

MALWA, an old province of central India, comprising a table land from 1,500 to 2,500 ft. above the level of the sea, bounded N. E. by the valley of the Ganges, E. by Budieleund, S. by the Vindhya, and W. by the Aravalli mountains, and lying chiefly between lat. 22° and 24° N., and lon. 74° and 78° E.; length about 220 m., average breadth 150 m. The people are mostly Hindoos. It is divided into a number of native states under British protection, and includes part of the possessions of Sindia and Holkar. The surface is uneven, with a gradual descent from the Vindhya mountains. It is watered by many rivers, the chief of which is the Chumbul, an affluent of the Ganges. The soil is fertile, producing cotton, tobacco, opium, indigo, sugar, and grain, and affording pasturage for large numbers of sheep and cattle. The rivers are not navigable, but a considerable overland trade is carried on in cottons, printed cloths, opium, and other products. The principal towns are Oojeln, Indore, Bhopal, and Bijia-Malwa became tributary to the sovereign of Delhi in the 15th century, but at the beginning of the 15th threw off the yoke, and for 130 years formed a powerful independent kingdom. It was subsequently conquered by Shir Khan, annexed to the Mogul empire by Akbar, overrun by the Maharrats early in the 16th century, and separated from the Mogul territory about 1732. It was long desolated by the Pindarrees, who were subdued by the marquis of Hastings and Sir John Malcolm. A police force of Bueels was subsequently organized by the British, and for some time proved highly efficient, but a large portion of it mutinied in 1857.

MAME, Alfred Henri Armand, a French printer, born in Tours, Aug. 17, 1811. In 1833 the printing establishment founded by his father in Tours came into his possession, in partnership with his cousin Charles Ernest Mame, who was mayor of Tours from 1851 to 1865. The cousins, who are also brothers-in-law, together extended the business till 1845, when it came under the sole direction of Alfred Mame, who raised it to the greatest importance. The establishment includes departments for printing, binding, and bookselling. About 700 persons are employed within and 500 without the premises. It produces daily about 20,000 volumes, bound and unbound. Among the special publications of this house are liturgical and devotional works, small books for religious education printed under the auspices of the archbishop of Tours, editions of the classics, and elementary treatises on science and education, issued likewise under ecclesiastical authority. Its small prayer books (Paroissiens), bound in leather and with gilt edges, are sold at retail for 35 centimes (about 7 cents). About 1854 M. Mame entered upon the publication of richly illustrated works, among the most celebrated of which is the Bible with illustrations by Doré (1855-'6). He obtained prizes at the London exhibition of 1851, the grand medal of honor at the French exposition of 1855, and the grand prize at that of 1867. In the last year he also received one of the prizes of 10,000 francs offered to model establishments in which the greatest social harmony and comfort prevail among the workmen.

MAMELUKES (Arabic, memalik, a slave), a body of soldiery who ruled Egypt for several centuries. They were introduced into that country by the sultan Malek el-Adel II. about the middle of the 15th century, and were composed originally of young captives purchased from the Mongols. They were called the Bahri Mamelukes, or Mamelukes of the river, because they were trained on an island in the Nile. They formed the body guard of the sultan. Turan Shah, the son and successor of Malek el-Adel, becoming unpopular, the Mamelukes deposed and murdered him about 1250, and raised their commander Ebyek to the throne. A line of sultans known as the Bahri or Turkish dynasty now followed, all of whom were raised to power by the Mamelukes, and many of them deposed and slain. A new band of Mamelukes, however, had been created by these sovereigns, composed of Circassians and Georgians, who were called Borgis, suggestive of a tower or castle, from the fact that they had been employed on fortifications in Egypt. In 1882 the Borgi Mamelukes gained the ascendency over the Bahris, and made their commander Barkok sultan. The Borgis continued in power till 1857, when they were subdued by the Ottoman Turks, and Egypt became a dependency of Constantinople. The Turkish sultan, however, placed the 24 provinces into which he divided Egypt under Mameluke governors or boys, who served to keep the Turkish viceroy in check. The boys also had the right to elect the governor of Cairo, an official of great power. The number of the Mamelukes was about 12,000, and they were nearly all from the region between the Black sea and the Caspian, whence they were brought in their youth to Cairo, compelled or persuaded to embrace Mohammedanism, and educated as soldiers. They did not intermarry with the natives of Egypt, but bought wives of their own race from the traders in Circassian slaves. These women from the north seldom bore children in Egypt, or if they did their offspring were sickly and short-lived. Though instances of hereditary
succession among the Mamelukes were not unknown, they were comparatively rare, and it was generally from master to slave, and not from father to son. Volney, who visited Egypt in the latter part of the 18th century, asserted that all Mameluke children perished in the first or second descent. Each of the 24 boys maintained 500 or 600 followers, thoroughly armed and equipped, and forming an admirable cavalry force. Each of the Mamelukes was attended by two armed slaves who fought on foot. In 1798, when Bonaparte invaded Egypt, his army first encountered the Mamelukes while on the march from Alexandria to Cairo. "The whole plain was covered with Mamelukes," says Scott, "mounted on the finest Arabian horses, and armed with pistols, carbines and blunderbusses of the best English workmanship, their plumed turbans waving in the air, and their rich dresses and arms glittering in the sun. Entertaining a high contempt for the French force, as consisting entirely of infantry, this splendid barbaric cavalry watched every opportunity for charging them, nor did a single straggler escape the unrelenting edge of their sabres. Their charge was almost as swift as the wind, and as their severe bites enabled them to halt or wheel their horses at full gallop, their retreat was as rapid as their advance. Even the practised veterans of Italy were at first embarrassed by this new mode of fighting, and lost several men; especially when fatigue caused any one to fall out of the ranks, in which case his fate became certain. But they were soon reconciled to fighting the Mamelukes, when they discovered that each of these horsemen carried about him his fortune, and that it not uncommonly amounted to considerable sums in gold." At the battle of the Pyramids, June 21, 1798, the Mamelukes mustered their full force, consisting of 7,000 men under Murad Bey, and attacked the French with desperate courage; but they were repulsed with terrible slaughter, and about 2,500 of them who survived fled to Upper Egypt. "Could I have united the Mameluke horse to the French infantry," said Napoleon, "I would have reckoned myself master of the world." After the French were driven from Egypt by the British, the Mamelukes regained in some degree their power, and a civil war broke out between them and the Turks. They were twice victims of treacherous massacres, and were completely crushed March 1, 1811, when Mehemet Ali beguiled 470 chiefs into the citadel of Cairo, and then closed the gates and ordered his Albanian soldiers to fire upon them. Only one escaped, a boy who leaped his horse from the ramparts and alighted uninjured, though the animal was killed by the fall. Immediately afterward a general massacre of the Mamelukes in every province of Egypt was ordered. The few who escaped fled to Nubia, and especially to the province of Sennar, where they built the town of New Dongola and attempted to keep up their force by disciplining negroes in their peculiar tactics. They did not succeed, however, and a few years later their number was reduced to about 100, when they dispersed, and the Mamelukes ceased to exist.

MAMIANI. See Messina.

MAMIANI, Terenzo della Rovere, count, an Italian philosopher, born in Pesaro about 1800. He received a superior education, and in 1831 took part in the revolutionary movement in the Romagna, and was proscribed. He took refuge in Paris, where he was occupied in literary labors until he was permitted to return to Italy by the amnesty granted in 1846 by Pius IX. He became prominent among the liberal statesmen who gathered around the pope, and accepted a place in the administration. The vacillating policy of Pius IX., however, soon led to his retirement, and he went to Turin, where with Gioberti and others he founded a patriotic society, of which he became president. In November, 1848, after the flight of the pope to Gaeta, he returned to Rome and became minister of foreign affairs; but he soon retired in consequence of the predominance of the ultra-republican element, and also resigned his seat in the constituent assembly. After the restoration of the papal power in 1849 he went to Piedmont, and subsequently became professor of philosophy in the Turin university, and a member of parliament. He warmly supported the policy of Cavour, and in 1860 was appointed minister of public instruction. From 1861 to 1865 he was minister at Athens. In 1866 he was accredited to Switzerland, but soon afterward became a member of the Italian senate. In 1870 he was restored to the chair of the philosophy of history in the Sapienza college at Rome, which he had formerly held. He is prominent among the most influential Italian philosophers of the last century. He is best known for his "Il primo e il secondo filosofico, or Il rinnovamento dell’antica filosofia italiana" (1834), in which he adbered to the doctrine of empiricism based on psychological investigation. But he soon became a convert to Rosmini’s opinion that the experimental method alone cannot philosophically reconstruct the science of nature and mind; and in his "Discorso sull’ontologia e sul metodo" (1841), and "Dialoghi di scienza prima e seconda" (1846), he strove to find a philosophical basis in common sense, and expressed for the first time his doctrine of immediate perception as the only foundation of a full insight into reality. This last phase of his doctrine is expounded in his "Confessioni di un metafisico" (1865), which is divided into two parts, respectively relating to ontology and cosmology.

A complete edition of his poetical works was published by M. Lemonnier (Florence, 1857). An English translation of his "Principi della filosofia del diritto ("Rights of Nations"), edited by Roger Acton, was published in London in 1860. Among his later works are: "Rinascimento cattolico" (1862); "Saggi di filosofia civile" (1865); "Meditazioni cartesiane"
it is prehensile and used as a fifth hand in hanging from trees; in the whales it becomes a powerful swimming organ, is provided on its under surface with V-shaped bones for the protection of the blood vessels, and, being horizontal, is used principally as an organ by which to rise to the surface to breathe; in the beaver the transverse processes and the lower spinous are very large for the attachment of the muscles, which move the tail like a trowel chiefly in a downward direction. The bones of the spine are united by elastic fibro-cartilages; these, in whales, form osseous disks, separating on maceration, and frequently used by arctic travellers for plates.—As all mammals breathe air, the mechanism of their respiration depends on the movable ribs and the diaphragm; man has 7 true and 5 false ribs, the former united to the sternum, the latter not; the number is in proportion to that of the dorsal vertebrae; in the whale, of 12 ribs, 11 are false, in the unau 11 out of 23, in the horse 8 out of 18, in the cats 4 out of 13, and in the manatee 14 out of 16; in the carnivora they are dense and narrow, in the herbivora large, broad, and thick. The breast bone varies in shape according to the presence or absence of clavicles; in non-claviculate mammals the chest is compressed laterally, and the breast bone has a projecting keel as in birds; in bats it is much keeled, in the higher apes flat as in man, and in the moles it extends in front of the ribs, forming a distinct piece; in mammals with clavicles the chest approaches very nearly to that of man; the human chest, however, is the only one in which the transverse exceeds the anteroposterior diameter, causing the greater separation of the shoulders and the increased facility of movement of the arms. The anterior ribs always extend as far as the breast bone, and are thus true ribs, differing in this respect from those of birds. Each of the ribs is usually connected by its head to an articular cavity formed by the bodies of two vertebrae, and by its tubercle to the transverse process of the posterior of the two; in the monotremata they are connected with the body alone, and in cetaceans often only with the transverse processes. The breast bone consists of several pieces, one behind the other, to which the anterior or true ribs are joined by cartilages which rarely become ossified; the posterior are the false or floating ribs, and are not attached immediately to the breast bone; this arrangement gives mobility to the chest and allows the elevation and depression of the ribs during respiration. The bones of the skull and face are immovably connected with each other, a character which does not occur in any of the lower classes; the brain cavity is larger than in birds and reptiles; the occipital condyles, near the centre of the base in man, are gradually removed to the posterior portion as we descend in the scale; the number of cranial bones, eight in man, is less than in most lower vertebrates. For the general characters see Comparative Anatomy,
where also are given sufficient details on
the organs of sense, teeth, digestive system, and
hair covering. The lower jaw consists of two
pieces, and is alone movable; in man it is sus-
tenable to motion up and down, laterally, and
from before backward; in the carnivora the first
movement, in the ruminants the second, and
in the rodents the third, is specially provided
for by the shape of the condyles and the form of
the glenoid cavity.—The limbs of mammals vary
exceedingly in shape, according to the
offices to be performed by them; we find
the hand of man with its thumb opposable to
the fingers, the four hands of the monkey, the
paddies of the whale, the walking feet of the
horse, the wing of the bat, the paw of the lion,
the shovel of the mole, all constructed on the
same type and modified from the same bony
elements.
The anterior limbs are always
present, with a well developed scapular arch,
usually kept in place by a clavicle; this last is
present in man, monkeys, the insectivora,
squirrels, and bats, but absent in cetaceans,
the hoofed animals, and some edentates; in most
carnivora and in some rodents it is imperfect-
ly developed; it corresponds to the furcular
bone in birds, and the monotremata have in
addition the second or coracoid clavicle of
birds. The shoulder blade is thin, flat, and
more or less triangular, generally with a well
marked spine; it is long and narrow in herbiv-
ora, and placed perpendicularly on the anterior
and lateral portion of the chest; in carnivora
and rodents, requiring more freedom of motion,
it is oblique, and so of course is the glenoid
cavity; jockeys are well aware that an upright
shoulder is the mark of a stumbling horse.
The arm bone is nearly straight in man, much bent
in the carnivora, long in monkeys and slothis,
and short in ruminants and cetaceans; it is con-
ected by a ball and socket joint with the scap-
ular; below it articulates with the radius and
ulna of the forearm by a hinge joint. The ulna
is the longest in man and lies on the inside,
and receives the arm bone in a deep sigmoid cavity;
the radius is connected with the wrist, and
turns with the movements of the hand, rolling
around and upon the ulna; this independence
of movement becomes less and less, according
as the limbs are more used as instruments of
progression; in the carnivora and rodents the
two bones are distinct, but the rotation is very
imperfect, and in the hoofed animals generally
the two make a single bone; the radius seems
to form the principal bone, the ulna being very
frequent, as in the horse and bats, very rudimen-
tary. The wrist in man consists of eight
bones in two rows, in other mammals varying
from five to eleven; to these are attached the
five parallel metacarpal bones in man, followed
by the five fingers, each having three joints,
except the first or thumb, which has only two;
in the ruminants the two metacarpals form
the single cannon bone; sometimes with rudimen-
tary bones on the side, as the splint bones of
the horse; most pachyderms have three
metacarpals, the elephant having five. In ani-
imals which walk on the ends of the toes, the
metacarpals are so lengthened that it has been
mistaken for the forearm, and supposed there-
fore to be flexed in an opposite direction to
that of man; but the lower part of the fore leg
of a horse, for instance, is in reality the meta-
carpus, and the part called the knee is the wrist
joint. The fingers vary from one to five; the
third or middle finger is the most constant, and
commonly the longest, and is the only one found
in the horse; the thumb disappears first, then
the little finger, and then the fourth finger;
ruminants have the second and third, or fore
and middle fingers. The hind limbs are more
firmly connected to the trunk than the ante-
rior; the supporting arch is the pelvis, com-
posed of the ilium, ischium, and pubis on each
side, the first joining the sacrum, the second
forming the prominences upon which man sits,
and the third uniting in front; in cetaceans
there is only a rudiment of this bony arch, and
the hind limbs are absent. The thigh bone,
the longest in man, is in most other mammals
relatively shorter; it is attached by a ball and
socket joint to the pelvis, in man its axis being
nearly that of the body, but in the lower mala-
sals bending more and more forward until
it forms an acute angle with the trunk. The
tibia and fibula correspond to the radius and
ulna of the forearm, and have the patella or
knee-pan in front of the articulation with the
thigh bone; these are coalesced in various an-
imals somewhat as are the radius and ulna; the
tarsal bones correspond to the carpal, and are
followed in the same manner by the metatarsus
and toes. In the apes the great toe is opposable
to the others, like the thumb, whence they are
called quadrumanous, four-handed; while man
rests his whole foot, from the heel to the toes,
on the ground, other mammals walk partially on
the toes; the tips of the middle fingers and toes, the heel being nearly
as high up as the knee in man, the cat on the
last two joints of several toes, and the bear on
the metatarsus and toes; there is no animal, ex-
cept man, that can be properly said to touch
the ground with the entire foot; in the seals
all the bones of the leg and foot may be recog-
nized, but they are united by a membranous web
into a kind of caudal fin. The bones of mala-
sals have not the air cells found in birds, but
are either solid or their cavities are filled with
an oily matter called marrow; there are, how-
ever, air cavities called sinuses, especially large
in the frontal bone of ruminants, as in the ox
and sheep, and greatly developed in the fron-
tal region of the elephant; these communicate
either with the nasal or auditory passages.—
While most mammals resemble man in the
arrangement of the muscles, others approach
birds and even fishes in this respect; as they
are less active than birds, their muscles are less
firm and the tendons less liable to ossify; they
are generally fewer in number than in man,
and their variations from the human type are
noticed chiefly in the limbs; in the mole, for instance, the flexors of the arm, the great pectoral, and the latissimus dorsi are very large; the herbivora, and pachyderms possess mighty muscles, and the agile carnivora compact and energetic ones; the muscles of the ears are specially developed in the herbivora, and those of the nose in the hog; the glutaeus maximus, the largest of all in man, is much smaller in the monkeys, and very small in the lower mammals; the nates in the horse are composed principally of the glutaeus medius; the muscles of the calf, so characteristic of man, are small in all below him, and the short muscles of the human hand are absent in the lower mammals; those of the wings in bats are arranged somewhat as in birds, and those of cetaceans as in fishes. A muscle remarkably developed in many mammals, but rudimentary in man, is the cutaneous layer, the pan-niculatus cornornus, of which the human analogue is the platysma myoides of the sides of the neck and face; we notice its action in the horse when a fly or any irritating object touches the skin, in the erection of the quills of the porcupine, and in the coiling of the body of the armadillo and hedgehog. The minute coccygeal muscles of man are represented by numerous and powerful ones in the prehensile tail of certain monkeys, in the strong trowel of the beaver, and in the fluke of the whale, analogons to the human multifidus spinae. In man and mammals the heart is composed of two distinct halves, each divided into two cavities, an auricle and a ventricle; the course of the blood is from the left ventricle to the aorta and over the body, pure arterial; then traversing the systemic capillaries it enters into the veins, and is carried to the right auricle; thence it passes to the right ventricle, and thence by the pulmonary artery to the lungs, in whose capillaries it becomes purified by the oxygen of the respired air, and is returned by the pulmonary veins to the left auricle, whence it enters the left ventricle to be distributed as before. Here, therefore, the blood passes twice through the heart and through two systems of capillaries before completing its circle; hence the circulation is called double, and it is also complete, as the whole mass of the blood is purified in the lungs before it is sent over the body. Before birth, when the lungs are impervious, the auricles communicate directly, and one or more vessels pass from the right ventricle to the aorta, conveying the blood over the body without sending it to the lungs; but when respiration begins these communications between the arterial and venous systems are closed. In the dugong the two ventricles are separated by a deep cleft; in some mammals the right auricle receives three venae cavae; the apex is not inclined to the left, as in man, except in some monkeys, and in some hoofed animals two thirds of the heart is encased in the substance of the left ventricle. In cetaceans there is a pleuroform arrangement of the arterial walls of the chest, allowing an accumulation of blood in them, to be used as required during prolonged submergence; in many ruminants the internal carotid forms a rete mirabile, or network of vessels, at the entrance of the skull, doubtless to prevent injury to the brain from too great force of the blood while the head is in a dependent position; in the slow-moving sloths the arteries of the limbs communicate very freely, rendering compression during their climbing impossible except in a few vessels at a time. A similar disposition prevails in the venous system; in the seal and otter, as in the ducks, the inferior cava is dilated into a receptacle which holds the blood while they are under water, and only permits it to pass on to the lungs when they come to the surface; in the porpoise tortuous sinuses receive the intercostal veins, and in the foot of the horse a fine network is distributed on the front of the coffin bone. The heart is composed of muscular fibres, each cavity having its own, arranged in a spiral manner from the point to the base; the course of the blood is directed from the auricles to the ventricles by the mitral valve on the left side and the tricuspid on the right, kept in place by tendinous cords attached to fleshy columns, and the entrances of the aorta and pulmonary artery are guarded each by three semilunar valves which prevent regurgitation. The lungs of mammals are almost always in pairs, and hang freely in the chest suspended by the straight windpipe, and enclosed within the serous cavity lined by the pleura; the air tubes are distributed to all their parts, and the pulmonary cells are minutely subdivided and do not communicate with any other air cells in the body as they do in birds. The windpipe varies much in length, in the number of its rings (which are from 14 to 78), and in their completeness; the cartilages do not generally form a complete tube, but are membranous posteriorly, and in the whales the membranous portion is said to be in front. The mechanism of the mammalian respiration has been described under DIAPHRAGM, the muscular partition which separates the thoracic and abdominal cavities in this class. The voice, under the control of the will, is produced by the passage of air from the lungs over certain organs in the larynx or upper portion of the wind-pipe; in man the larynx is a short and wide tube, suspended as it were from the hyoid bone, formed of cartilaginous plates, called the thyroid, cricoid, and two arytenoid cartilages; the prominence commonly called "Adam's apple" is the anterior surface of the thyroid cartilage. The mucous membrane forms two lateral folds from before backward, like the lips of a buttonhole, the vocal cords or ligaments; above these are two other folds, between which and the vocal cords is a cavity on each side, the ventricle of the larynx; the space between these four folds is the glottis, which is covered above, during the passage of food or drink, by a fibro-cartilaginous tongue,
of the epiglottis. In ordinary respiration the air passes noiselessly; but when the will contracts or otherwise modifies these cords, sound is produced, which in man becomes articulate speech by the action of the pharynx, nasal passages, and parts contained within the mouth. The epiglottis exists in all mammals, but it is sometimes divided at the upper end; in cetaceans, the larynx ascends to the posterior nares and communicates with the blow-hole on the top of the head. The lion's roar depends on the great size of the larynx; the grunt of the hog is produced in cavities communicating with its ventricles; the neigh of the horse by vibration of folds connected with the vocal cords; the bray of the ass by reverberation in a large cavity with small aperture under the thyroid cartilage; in the howling monkeys the hyoid bone is dilated into a bony pouch, and each ventricle opens into a large membranous sac, in which the loud sounds of these animals are produced; in the marsupials the voice is very weak.—The urinary system of mammals consists of secretory organs (the kidneys), and a reservoir for the secreted fluid (the bladder), communicating with the former by the ureters and externally by the urethra. The kidneys of mammals present the same external cortical and internal tubular portions as in man, and also the suprarenal capsules, in the lumbar region near the vertebral and external to the peritoneal sac; they differ somewhat in form, being more or less lobulated, as in the human fetus, in cetaceans, seals, otters, bears, the elephant, and ox; the lobules vary from 10 in the otter to 190 in the seals, in cetaceans resembling a bunch of grapes; in all, except the monotremata, the ureters open into the bladder; in these into the urethra, as in chelonians. The bladder is generally more loosely connected in other mammals than in man; it is largest in the herbivora, smaller and more muscular in the carnivora and rodents. The chemical composition of the urine is about the same in carnivora as in man, except in the absence of uric acid; in the herbivora it is alkaline, containing hippuric acid and much earthy carbonate. In the stags, below the inner angle of the eyes, there are two openings communicating with a large membranous pouch, from the glands of which is secreted a brownish liquid, flowing down the sides of the face, like tears; many animals have glands on the abdomen, in the groins, or about the genito-anal openings, whose secretion is very odorous, as in the musk deer, beaver, civet, and skunk.—The special internal male organs are the testes, which secrete the sperm, with certain accessory glands (as the prostate and Cowper's), and seminal receptacles or vesiculae; in the female the germ cells are formed in the ovaries, whence they escape through the Fallopian tubes into the uterus, and thence when full-grown externally; as the name mammal imports, they have also external glands for the secretion of milk, the mamma or breasts. The testes may be permanently external, as in the dog; always abdominal, as in the seal, elephant, and cetaceans; or external during the rutting season and at other times internal, as in the mole and porcupine. The epibaldymy is usually largely developed; the seminal vesicles are found in monkeys, bats, rodents, and pachyderms, but are wanting in carnivora, most plantigrades, ruminants, and marsupials; the prostate gland exists in some form in all mammals; the absence of Cowper's glands in most pachyderms, rodents, and carnivora shows that their action is not essential to reproduction. The human ovaries are two oval, glandular bodies, about an inch long, in the posterior portion of the broad ligaments; each contains about 20 Graafian vesicles, enclosing an ovum. All the internal organs, except the uterus, are much alike in the other mammals. This last organ, single in the monkeys, is in carnivora, many rodents, pachyderms, ruminants, and cetaceans, generally divided at the base into two horns (cornua), each sometimes having its distinct opening; in marsupials the ovaries are more or less racemose, as in birds. In most mammals, after the fecundated ovum has descended through the Fallopian tube (in the higher orders about the 12th day), an intimate vascular connection takes place between the sinuses of the parent and the chorion of the foetus, forming the placenta, which continues to supply the young with nutrition until it is capable of an independent existence. The period of utero-gestation, about 270 days in the human mammal, varies in the different families. This group of placental mammals has been called monodelphians to distinguish them from the didelphians, which include the marsupials and monotremata; the former have a more perfect brain, with its hemispheres united by a corpus callosum; the latter bring forth their young in a very imperfect condition, but have the brain destined to be of a corpus callosum. The abdominal walls supported in front by two bones arising from the pubis, and an external pouch for the reception of the young. Prof. Jeffries Wyman ("Proceedings of the Boston Society of Natural History," vol. vi., p. 363), from the examination of a large number of feral pigs, has shown that the above division of mammals into "placentals" and "implacentals" is not well defined; he found that in pigs there is, strictly speaking, no placenta, the maternal and fetal vessels being in relation only by means of very minute diffused villi and slight foldings of the chorion; this condition is intermediate between those of marsupials and ruminants, and shows such a gradual transition in this respect that the former must be brought nearer than has been usually admitted to ordinary mammalia. Mammary glands exist in both sexes, but serve for purposes of lactation only in the female; the number is generally in relation with the number of the young at a birth; there are 2 in monkeys,
the elephant, the goat, and the horse; 4 in the cow, the stag, and the lion; 8 in the cat; 10 in the hog, rabbit, and rat; and 12 or 14 in the agouti. The position also varies; in monkeys and bats they are on the chest, in most carnivora on the chest and abdomen, and in the ruminants far back between the posterior limbs; in marsupials they are concealed within the abdominal pouch. Some mammals are born with the eyes open, and are at once able to run in search of food; many, however, are born with the eyes closed and in a very weak condition; and a few, as the marsupials, leave the uterus in such an imperfect state that they would perish did not the parent place them in her pouch, where they complete their development, each suspended to a teat. In the monotremata (ornithorhynchus, &c.), which seem to form the connecting link between the mammals and birds, in addition to the horny bill, cloaca, and bird-like ovaries, there are the form, external covering, skeleton, and milk-secreting glands of the mammals.—As to physiological distribution, some mammals dwell entirely in the sea, as the cetaceans and most seals; some of the latter and the sirenomed pachyderms (manatee, &c.), live chiefly in fresh water; others, beavers, muskrats, the ornithorhynchus, &c., frequent rivers and lakes; but most live upon the land, some on mountains like the chamois and ibex, some on plains like the antelopes and bison, some on trees like the apes, squirrels, and sloths; others sail or fly in the air like the flying lemur and the bats, and others live under ground like the moles. For these different methods of progression and habits of life, the limbs are variously adapted by modifications of the same few osseous elements, and the study of fossil mammals develops the same order in past geological ages. The study of the geographical distribution of mammals shows that the number of genera and species increases from the poles to the equator, with the exception of the whales and seals, which are most numerous in the polar regions; within the northern arctic circle there are species common to both hemispheres, as the arctic fox, white bear, reindeer, and ermine; in temperate North America the species are different from those of the eastern hemisphere, and in South America even the genera from those of the old world, as those including the peccary, llama, armadillo, ant-eater, sloth, cavy, agouti, vampire bat, marmoset, the howling and prehensile-tailed monkeys; the raccoon and muskrat are exclusively American; the hog, horse, camel, rhinoceros, elephant, lion, tiger, lemur, and anthropoid apes belong now to the eastern world; the giraffe, hippopotamus, chimpanzee, and most of the antelopes are African; all the marsupials (except the American opossums) and the monotremata are Austral; while the stags, squirrels, cats, bears, dogs, and bats are absent from this region. The marsupials, though forming scarcely one fifteenth of the land mammals in the world, constitute three fourths of the mammalian fauna of Australia; exclusive of cetaceans and seals, the rodents form one third of the entire number of species of the world, the bats and carnivora one third, the remaining third being chiefly the monkeys, ruminants, marsupials, and insectivora, according to Van der Hoeven; in Europe, wanting marsupials and monkeys, the rodents are one third, bats one sixth, and insectivora about one thirteenth; in North America the species of rodents form perhaps half the entire number of land mammals; the large pachyderms, edentates, and the apes belong to the warm regions, most of the latter being African; the insectivora are almost peculiar to the northern hemisphere, and the le- nurs are most common in the southern. Ex- cepting the whales and bats, mammals do not migrate, but spend the summer and winter in the same locality; the whales pass the summer in the polar regions, and come southward in winter into the same locality. The phenomena of hibernation or winter-sleep in mammals have been described under the former title.—MAMMALOGY includes the classification of mammals. The mammalia were first separated from other four-footed animals by Aristotle, who called them soōtoco or viviparous animals; he divided them into three sections according to their locomotive organs: 1, dipoda, or bipeds; 2, tetrapoda, or quadrupeds; 3, apoda, or impeds or whales. The quadrupeds, including all but man and the cetaceans, he subdivided into two great groups according to the modifications of the organs of touch, in the first of which the ends of the digits are left free for the sense of feeling, the nail being on the upper surface only, and in the second the feet ending in hoofs, corresponding respectively to the un- guiculata and ungulata of Ray. The ungucu- lates he divided by the teeth into three families: 1, those with cutting incisors and trituration or flattened molars, like the apes (pithe- coida) and the bats (dermaptera); 2, those with canine or carnivorous teeth, earcharo- donta or gampsonucha; 3, those corresponding to the rodents, with the negative character of the absence of canine teeth. The ungulate or hoofed quadrupeds he divided, according to the organs of motion, into: 1, polyostride or multungulates, like the elephant; 2, dischidida or bisulcates, including the ruminants (mery- cizonta) and the hogs; and 3, aschid, or so- lidungulates, like the horse. The apodal quad- rupeds included the cetaceans or cetoda. It thus appears that Aristotle clearly perceived the principles upon which mammals are classi- fied by the best modern naturalists.—This ar- rangement was not improved upon until John Ray published his Sygnum in 1698 in London, and his improvements relate to the four-foot- ed mammals. In his ungulate quadrupeds he places the solipeds (as the horse), the bisul- cate ruminants (like the ox and stag) or non- ruminants (as the hog), and the quadrissulcate (rhinoceros and hippopotamus); in the un-
gnicate the feet are either bifa (as in the camel), or multitud with digits adhering togeth-
er (as in the elephant), with distinct depressed digits (as in apes), or compressed (as in car-
nivora, insectivora, rodents, and edentates).—Linnaeus founded his primary divisions on
the locomotive organs, deriving his orders from the modifications of the teeth; in his ear-
erly editions of the Systema Naturae, up to the 10th, he called the class quadrupedia, in-
cluding the cetaceans among fishes; in his 12th edition (1766) he makes seven orders, as fol-
low: A. Ungulata: I., primates, with four
front cutting teeth, including man, the mon-
keys, and bats (4 genera); II., bruta, with no
front teeth in either jaw, including the el-
phant, walrus, and edentates (6 genera); III.,
fero, with front teeth, conical and long canines,
including the carnivora, opossum, and insecti-
vora (10 genera); IV., glires, with two front
cutting teeth in each jaw, including the ro-
dents (6 genera). B. Ungulata: V., pecora,
with cutting front teeth in the lower jaw, but
none in the upper, including the ruminants (6
genera); VI., bellua, with obtuse front teeth
in both jaws, including the pachyderms gen-
erally (4 genera). C. Mutica: VII., cetæ, with
horns or bony teeth, pectoral fins instead of
feet, and horizontal flattened tail, including
the cetaceans (4 genera). He thus made 40 genera
in all. Linnaeus followed Ray in placing the
elephant among the unguiculata, an error
avoided by Aristotle. In 1798 Cuvier pub-
lished his Tableau élémentaire des animaux,
in which he laid down the basis of his classi-
fication, which was variously modified until
the second edition of his Règne animal in 1829;
in that work he makes the nine fol-
lowing orders of mammalia: binana, qua-
drumana, carnivora, marsupialia, rodentia,
edentata, pachydermata, ruminantia, and ce-
tacea. In his first edition the marsupials were
ranked among carnivora, and in the Tableau
élémentaire there were three grand divisions:
I., unguiculata, with the orders binana, qua-
drumana, cheiroptera, plagiura, carnivora,
pedmana, rodentia, edentata, and tardii-
grada; II., ungulata, with the orders pachy-
dermata, ruminantia, and solipeda; and III.,
mutica, with the orders amphibia and cetacea.
—The systems of Blumenbach, Illiger, and
Desmarest differ little from that of Cuvier, ex-
cept in the names of the orders and their sub-
divisions. De Blainville (1822) makes in the
type otoezius, or vertebrates, the sub-type
vesicara and the class pilisera or mammisera,
with the division monodelphia and didelfphia.
Temminck (1827) makes the 11 orders of man,
monkeys, bats, carnivora, marsupials, rodents,
edentates, pachyderms, ruminants, cetaceans,
and monotremata. Fischer, in his Synopsis
Mammalium (1829), makes the nine orders of
primates (man and monkeys), cheiroptera
(bats), feræ (carnivora), bestia (insectivora and
marsupials), glires (rodents), bruta (edentates
and monotremata), bellua (pachyderms and
soliceps), pecora (ruminants), and cete (her-
vivorous and ordinary cetaceans).—McLay
(1821), the founder of the quinary classifica-
tion, makes five orders of mammals, which
may be arranged in a tabular form as follows:

<table>
<thead>
<tr>
<th>Mammalia</th>
<th>Characters</th>
<th>Birds</th>
</tr>

</table>

This shows the analogies between mammals and
birds, in regard to food and habits, which
were afterward modified by Swainson (1835) as follows: I., typical group, quadru-
manæ, organized for grasping; analogous to
insectivorous birds; II., sub-typical, feræ, with
retractile claws and carnivorous, to the rap-
tores; III., aberrant group, including cetææ,
ominously aquatic, with very short feet, to
natatoræ; glires, with lengthened and point-
ed muzzle, to grallatores; and ungulata, with
crests on the head, to rauvore.—Oken in 1802
divided animals into five classes according to
the organs of sense; this view is elaborated in
his "Physiophilosophy" (Ray society editi-
1847); of these five classes the fifth and
highest is the ophthalmozoa or mammalia, so
called because in them the eyes are movable
and covered with two perfect lids, the other
sense organs having however suffered no de-
gradation; he also calls them thricoza or pli-
lose animals on account of their hairy hair-
covering, and aesthetic or sensorial animals
from the completion and combination of all the
organs of sense. They belong to his province
of sarcozoæ or flesh animals. His divisions are
as follows: A. Splanchno-thricozoæ: or-
der I., rodents; II., edentates and marsupials;
III., insectivora and cheiroptera. B. Sarco-
throzoæ: IV., ungulata. C. Æsthesio-thri-
throzoæ: V., unguiculata. Every family of the
thricozoæ contains five genera, in accordance
with the five organs of sense. The human
family or genus has also five varieties on the
same principle: 1, the skin, the black
African; 2, the tongue man, the brown Aus-
tralian and Malay; 3, the nose man, the red
American; 4, the ear man, the yellow Mongo-
lian; and 5, the eye man, the white Euro-
pean.—Another philosophical system is that
of Carus. The mammalia are made the sev-
enth class of his third circle, the cephalo-
zoæ. He makes ten orders, as follows: 1, natantia,
or herbivorous and carnivorous cetaceans,
with evident relations with fishes; 2, reptiantia,
or monotremata and edentates, related to repti-
lakes; 3, solitarioïdæ, bats and flying lemuris,
related to birds; 4, mergentia, seals and wal-
rus, a repetition of the first; 5, marsupialia,
a repetition of the second; 6, glires or rodents,
a repetition of the third; 7, pachydermata, a
second repetition of the first; 8, ruminantia,
a second repetition of the second, indicated
by the fifth, which is half ruminant; 9, feræ,
MAMMALIA

a second repetition of the third; and 10, quadrumana, having relations with man.—The fundamental idea of the classification of Fitzinger (1848) is the same as that of Oken, the class mammalia having five series, according to the development of the organs of sense, and each series three orders, viz.: Touch. Taste. Smell.

Hearing. Vision. 

—Of the embryological systems of classification may be mentioned those of Von Baer, Van Beneden, and Vogt. Von Baer (1825) proposed the following divisions of this class of his doubly symmetrical or vertebrate type, with osseous skeleton, lungs, an allantois, and an umbilical cord: the cord may disappear early, 1, without connection with the mother (monotremata), or 2, after a short connection with the mother (marsupialia); or the cord may be longer persistent, 1, the yolk sac continuing to grow for a long time, the allantois growing little (rodentia), moderately (insectivora), or much (carnivora), or 2, the yolk sac increasing slightly, the allantois growing little and the umbilical cord very long (monkeys and man), continuing to grow for a long time and the placenta in simple masses (ruminants), or growing for a long time and the placenta spreading (pachyderms and cetaceans). According to Vogt (1851), mammals may be arranged in two divisions: I, aplacentaria, with the orders monotremata and marsupialia; and II, placentalia, with series 1, composed of the orders cetacea, pachydermata, solidungula, ruminantia, and edentata; series 2, of the orders pinnipedia and carnivora; and series 3, of the orders insectivora, solitaria, glivo, quadrumana, and bima. Van Beneden (1855), in the class mammalia of his hypocyotyledones or hypoveltillians (vertebrates), in which the vitellus or yolk enters the body from the ventral side, establishes the ten orders primates, cheiroptera, insectivora, rodentia, carnivora, edentata, proboscidea, ungulata, sirenoidea, and cetacea. Prof. Baird (in vol. viii. of the "Pacific Railroad Survey," 1857) adopts the following arrangement: A, ungulata, with the orders: 1, quadrugrana; 2, cheiroptera; 3, raptalia; 4, marsupialia; 5, rodentia; and 6, edentata;—B, ungulata, with orders: 7, solidungula; 8, pachydermata; and 9, ruminantia;—C, pinnata, with orders: 10, pinnipedia; and 11, cetacea. All of these, except the first, are found in North America; the horse, though not now existing native, was formerly an inhabitant of this country. Agassiz, in his essay on classification (1857), makes mammals the eighth class of vertebrates, with only the three orders of marsupialia, herbivora, and carnivora.—Owen (in the article "Mammalia" in the "Cyclopaedia of Anatomy and Physiology," 1847) admits in the sub-class of placentalia the ten orders of bimana, quadrumana, cheiroptera, insectivora, carnivora, cetacea, pachydermata, ruminantia, edentata, and rodentia, and in the sub-class implantentalia the orders marsupialia and monotremata; the monkeys by the galeopithecus are connected with the cheiroptera, and by the lemurs with the carnivora; the last by otaria are related to cetacea, which in turn have certain affinities with the fishes; the rodents are connected with ruminants by the musk deer; the monotremata lead to reptiles.—Before introducing the more recent classification of mammals by Prof. Owen, according to the cerebral system, the reader should be reminded that until the time of Cuvier the principal subdivisions were based upon the Aristotelian characters derived from the organs of locomotion, the secondary groups being established on the peculiarities of the dental system; Cuvier added others drawn from the osseous and generative systems; De Blainville in 1816 first adopted the division, according to the method of reproduction, into monodelphs, didelphs, and ornithodelphs, or ordinary mammals, marsupials, and monotremes, retaining for the most part the Linnaean orders. Classification by the placenta seems to have been first proposed by Sir Everard Home, but, as modified by successive naturalists, leads to many unnatural affinities; placing, for instance, rodents and insectivora with monkeys, and solipeds, pachyderms, and some ruminants with the carnivorous cetaceans. Prince Bonaparte, in his Systema Vertebatorum (1840), adopts the division of placentalia and implantentalia, subdividing the first into the sub-classes of educabilia and ineducabilia, the latter including the orders bruta, cheiroptera, insectivora, and rodentia, with the common character of a single-lobed cerebrum; Prof. Owen regards this as the most important improvement since the establishment of the natural character of the ovo-viviparous or implantental division. In 1845 Isidore Geoffroy Saint-Hilaire raised the marsupials to the rank of a distinct class, making its subdivisions orders equivalent to those of the placentalia; Owen, however, did not regard them as groups of equal rank and value. In 1849 Prof. Owen, from the consideration of the times of formation and the succession of the teeth, divided mammals into two groups, monoplyodonts, or those which generate a single set of teeth (as the monotremata, bruta, and cetaceas), and the diphyodonts, or those which generate two sets of teeth (comprising the great bulk of the class); at the same time he wished it to be clearly understood that this dental character is not so associated with other organic characters as to indicate natural or equivalent subclasses. As early as 1842 he drew attention
to the value of the principal modifications of the mammalian brain in regard to their association with concurrent modifications in other systems of organs; it was not till 1857, however, that he felt himself justified in proposing to the Linnean society a fourfold division of this class, based upon the four leading modifications of the cerebral structure. His first and lowest group or sub-class is called gyrencephala, signifying the loose or disconnected state of the cerebral hemispheres, which leave exposed the olfactory ganglia, the cerebellum, and more or less of the optic lobes, have the surface generally smooth, and the anfractuosities, when present, few and simple; in this division the absence of the corpus callosum commissure is associated with the marsupial mode of development and the non-development of the placenta; it includes the monotremes and marsupials. The next stage in the development of the brain is where the corpus callosum is present, but the hemispheres leave the olfactory lobes and cerebellum exposed, and are commonly smooth or with few and simple convolutions; these are the lissencephala, or smooth-brained mammals, or rodents, insectivora, bats, and edentates, in many respects, in common with the preceding subdivision, resembling birds and reptiles. The third modification is an increased relative size of the hemispheres, which extend over more or less of the cerebellum and olfactory lobes, and have their surface, except in a few of the lower quadrupeds, folded into more or less numerous gyri or convolutions; hence this sub-class is called gyrencephala; among these are not found marks of affinity with the ovi- para, but the highest mammalian perfection is attained, as shown by size, strength, activity, sagacity, and docility of many of its members; this sub-class comprises the other orders of mammals, man only excepted. In man the hemispheres overlap the olfactory lobes and cerebellum, extending in advance of the former and further back than the latter; in man only is there what is called a third or posterior lobe, and in him the superficial gray matter attains its highest development through the number and depth of its convolutions; as representing a distinct sub-class of mammalia, and ruling naturally over all the other members of the class, he proposes for man the name of archencephala, signifying that he is master of the earth and of the lower creation. For details on the characters of the secondary groups and their distribution in time and space, the reader is referred to the original paper in the "Proceedings of the Linnean Society" of London, vol. ii., pp. 1-37, 1857. His tabular arrangement is as follows:

The later classification of Huxley does not differ materially in its orders from that of Owen.

—Among the many recent American laborers in the department of mammalian classification may be mentioned Prof. Theodore Gill of Washington, D. C., whose articles on this subject, too long to be condensed here, will be found in the "Proceedings of the American Association for the Advancement of Science" for 1870 and 1871. The fossil mammals must be considered before the student can form an idea of the affinities of the class; these and the orders of existing mammalia will be treated under their respective titles. The mammalian class has existed certainly from the lower oolitic period, and probably from the triassic; during
MAMMARY GLANDS

this immense lapse of time genera and species have changed, either that they have been newly created at the several epochs, or, as Darwin and others maintain, have been modified by processes of natural selection and development. Many original and intermediate forms having become extinct, and, from the imperfection of the geological record, as yet having afforded no indication of their existence. None of the mammalian genera of the secondary epoch have been found in the tertiary ones; no genus of the older eocene has been discovered in the newer; very few eocene genera have been found in the miocene, and none in the pliocene; many of the miocene genera are peculiar to that division, and some indistinguishable from existing species begin to appear only in the newer pliocene; while the perissodactyls and omnivorous artiodactyls have been gradually dying out, the true ruminants have been increasing in genera and species. One class of organs seems to govern one order, and another class another order; for example, the teeth, which are so diversified in marsupials and edentates, are remarkable for the constancy of their characters in rodents and insectivora; and as a general rule, the characters from the dental, locomotive, and placental systems are more closely correlated in the geonecephala than in the two inferior sub-classes. 

MAMMARY GLANDS, the organs which secrete the nutritive fluid, milk, by which the young of man and the mammalia are nourished during the early periods of life. They vary from two in the human female to 10 or 12 in the lower mammals, and may be pectoral as in the former, or pectoral and abdominal, or only abdominal, as in the latter. Each gland is made up of a number of separate lobules, more or less closely connected by fibrous tissue and fat, and bound down by the same to the pectoral or abdominal muscles. The lactiferous tubes arising from the minute ultimate follicles of the lobules terminate in the mammary tubes of the nipple, 10 or 12 in the human female, straight but of variable size; at the base of the nipple, and extending into the gland, are reservoirs for containing a constant supply during lactation; these are often much larger in the lower animals than in woman. The skin covering them is very delicate and smooth; the colored circle around the nipple is called the areola, which becomes darker during and after gestation; the irregular surface of the nipple is covered with a very sensitive skin, and much erectile tissue enters into its substance. The tubes are lined with a very vascular mucous membrane, which has its own secretion sometimes in considerable quantity. These glands, especially during lactation, are well supplied with blood from branches of the subelavian and axillary arteries; their nerves come from the brachial plexus and the intercostals, and the sympathetic plexus accompanying the mammary arteries. The inner surface of the follicles is covered with a layer of epithelium cells, the real agents in the secreting process. They present no great difference in size in the sexes until near the age of puberty, when a considerable enlargement takes place in the female; from the increased supply of blood during gestation, there is a sense of tenderness and distention which is one of the earliest and most valuable signs of pregnancy. These glands in the male are miniatures of those of the female, but the essential structure is the same, as is shown by the authentic cases in which they have become sufficiently developed in men to produce a secretion of true milk. Though the functional activity of these glands is naturally limited to the period succeeding parturition, their secretion is sometimes seen in virgins and in aged women, in whom a strong desire to furnish milk and a continual irritation of the nipple by the infant’s mouth have stimulated the organs to unnatural activity. The prolonged secretion of milk in domestic cows, which usually lasts for about ten months after calving, is simply a continued action of these glands due to artificial treatment. The presence of these organs has given the name to the mammalia, the highest class of vertebrated animals, implying a mode of intra-uterine and extra-uterine development not found in birds, reptiles, or fishes. Physiologically these glands belong to the generative system, and are gradually removed from the caudal to the pectoral region, as we ascend from cetaceans to the human female; the forward, outward, and upward direction of the nipples is exactly adapted to the position of the child lying in its mother’s arms, and the greater abundance of the lactiferous tubes at the lower portion of the breast forms a soft cushion for its head to rest upon. In the African and sometimes in other races, after lactation, the skin covering the breasts becomes so lax, and the organs so elongated, that they can be thrown over the shoulders like bags. The mammary glands are subject to many painful and dangerous diseases, among which may be mentioned acute and chronic inflammations, abscesses, and encysted, fibrous, and cancerous tumors; they are sometimes enormously overloaded with fat.

MAMMEE APPLE (mammee Americana), a handsome tree of 60 ft. in height, native of the Caribbean islands and the neighboring continent. It has large, oval or obovate, shining, leathery, opposite leaves, white, sweet-scented flowers, and large, round, obsoletely three- or four-cornered fruit, which sometimes grows to the size of a child’s head. The fruit is covered with a double rind; the outer is leathery, tough, and brownish yellow; the inner, thin, yellow, closely adhering to the flesh, which is firm, bright yellow, and of a singular pleasant taste and a sweet aromatic smell; but the skin and seeds are very bitter and resinous. The pulp is eaten alone, or cut up into slices with wine and sugar; prepared as a jam or marmalade, or with sirup. From the yellowness of
the pulp, like that of an apricot, it is called by the French abricot sauvage. This fruit is occasionally brought to our seaport cities, but rarely in an eatable condition. The seeds, which are sometimes as large as hen's eggs, are used as anthelmintics, and an aromatic liquor called eau de créole is distilled from the flowers. The tree belongs to the natural order of guttifera. Browne ("Natural History of Jamaica," London, 1736) speaks of the species as among the largest trees of Jamaica, and esteemed among the best timber trees. It has been observed that no one can behold this tree towering above a cluster of fruit trees without a sentiment of respect for it. The mammee tree has become naturalized in some parts of Africa, where it produces excellent fruit. Two or three other species, natives of tropical Asia, are known to botanists. 

**MAMMOTH**, the fossil elephant of Siberia (*elephas primigenius*, Blumenbach), found in the diluvial strata of Europe and Asia, and perhaps also in North America. Large fossil bones were alluded to by Theophrastus, Pliny, and many ancient authors, and were general-

ly supposed to be the remains of giant men. They are abundant in the drift of central and northern Europe, mingled with the bones of other pachyderms, principally in river basins; in Great Britain, in the Kirkdale cavern of Yorkshire; in Sweden and Norway; but most abundantly in the frozen region of European and Asiatic Russia, about the mouths of rivers descending into the icy sea; there is indeed hardly a river in Siberia in whose bed or on whose banks these remains have not been found, as well as in the neighboring plains, in connection with bones of other animals now strangers to the climate; they are not found in the elevated districts. In Siberia fossil ivory is so abundant and so well preserved that it gives rise to a considerable traffic both for home and foreign use. The most remarkable discovery in relation to the mammoth was the occurrence of a carcass found by a Tungus fisherman in a block of ice on the border of the Arctic sea in 1799, near the river Lena; in the course of

Skeleton of Mammoth.
between the fossil and living elephants, as determined by Cuvier. In the former the laminae of the teeth are narrower and more numerous than in the Indian elephant, which they most resemble, with the lines of enamel more slender and less festooned, and the teeth absolutely and relatively wider. The tusks are larger than in most living specimens, and generally more curved, but the structure is the same. In the skull, there is much greater length and perpendicularity in the sockets for the tusks; the head is more elongated, with a greater development of occiput, and concave and nearly vertical forehead; the long alveoli must have modified the trunk, and have given the animal a different physiognomy from that of the present elephant; the antero-posterior length of the lower jaw is less, the lower molars are parallel instead of converging forward, and the jaw is truncated in front instead of having a projecting grooved symphysis. The bones of the limbs are more massive, and the usual distance between the two condyles of the femur is reduced to a narrow line. The skin is like that of the living elephant, but is covered with hair of three kinds; the longest, 12 or 15 in., is brown and like horse hair; the shorter, 9 or 10 in., is more delicate and fawn-colored; and the wool at the base of the hair, 4 or 5 in. long, is fine, smooth, fawn-colored, and a little frizzled toward the roots; there is a mane on the neck, and the whole covering is well suited for a cold climate. The mammoth has never been found living, nor have any of the existing elephants been discovered in the fossil state; it was probably not much if at all higher than the elephants of the present epoch, but was stouter, more clumsy, and heavier. Their bones are found mingled with those of the rhinoceros, ox, antelope, horse, often with marine animals, and sometimes with fresh-water shells. They were undoubtedly overwhelmed by a comparatively recent and sudden catastrophe during some portion of the long drift period, accompanied by a depression of temperature, and probably by a subsidence of the land and an invasion of the sea, general over the northern regions of both hemispheres; during the preceding tertiary epoch there was an elevation of temperature, permitting tropical animals to go far to the north; this temperature gradually became colder, the animals becoming adapted for it, as shown by their external covering, until they suddenly became extinct during the glacial period of the drift. From the abundance of the remains found in Siberia, it is inferred that elephants were more numerous during the diluvial epoch than at the present time. To the **E. primigenius** belong the Siberian fossils, and most, if not all, of those of the drift of Europe.—Several species of fossil elephant have been found in North America, referred by some to the **E. primigenius**. Prof. H. D. Rogers ("Proceedings of the Boston Society of Natural History," vol. v., Feb. 1, 1854) drew attention to the fact that while the European mammoth is found in the drift stratum, the North American fossil elephant is imbedded in strata above the drift, of a distinctly more recent age, and was a contemporary of the mastodon *giganteus*, their bones being found together in the marshy alluvium of Big Bone Lick; he maintains that they lived together in the long period of surface tranquility which succeeded the strewing of the general drift (the period of the Laurentian clays), and were overtaken and exterminated together by the same changes, partly of climate, partly of a second but more local displacement of the waters which reshifted the drift, and formed the later lake and river terraces. From figures on bones, it is beyond doubt that the mammoth lived with man in the early stone age. In the pliocene deposits of Kansas and Nebraska Dr. Hayden found bones of mastodon and elephant (**E. imperator**, Leidy), and a similar coexistence has been ascertained in the pliocene of Europe; the remains of this and **E. Americanus** have been found in Kentucky, Texas, Mexico, Spanish America, from Alaska to Georgia and the Mississippi valley, and as far west as Oregon and California. The elephants of the tertiary sub-Himalayan Sivalik hills have been described by Cautley and Falconer; in these the dental laminae are so separated that each forms the summit of a ridge, making a transition from elephant to mastodon, constituting the genus *steedodon* (Cautley and Falconer). The mammoths of the American continent are now admitted to be different species from those of Europe and Asia.—For details on the mammoth, see Cuvier's articles in vol. viii. of the *Annales du Muséum*, and in vol. i. of the *Oeuvres fossiles*; Pictet's *Traité de paléontologie*, vol. i.; vol. v. of the "Naturalist's Library," which treats of the pachyderms; and vols. ii. and iv. of the "American Naturalist."

**MAMMOTH CAVE**, the largest cavern known, situated in Edmonson co., near Green river, in Kentucky, about 75 m. S. S. W. of Louisville. Its mouth is reached by passing down a wild rocky ravine through a dense forest; it is an irregular, funnel-shaped opening, from 50 to 100 ft. in diameter at the top, with steep walls about 50 ft. high. The cave extends about nine miles, and it is said that to visit the portions already traversed requires from 150 to 200 miles of travel. This vast interior contains a succession of marvellous avenues, chambers, domes, abysses, grottoes, lakes, rivers, catastrophes, &c., which for size and wonderful appearance are unsurpassed. The rocks present numerous forms and shapes of objects in the external world, while stalagmites and stalactites of gigantic size and fantastic form abound, though not so brilliant and beautiful as are found in some other caves. Chief among the objects of
interest are Sullivan's avenue, about 1½ m. long, from 20 to 200 ft. wide, and from 20 to 40 ft. high; Marion's avenue, of about the same dimensions; the Star chamber, about 500 ft. long and 70 ft. wide, the ceiling of which, 70 ft. high, is composed of black gypsum, and is studded with innumerable white points, which by a dim light present a most striking resemblance to stars; and Cleveland's cabinet, an avenue about 2 m. long, spanned by an arch of 50 ft., with an average central height of 10 ft. By many the last is regarded as the most wonderful object in the cave. "It is inerced from end to end with the most beautiful formations in every variety of form. The base of the whole is sulphate of lime, in one part of dazzling whiteness and perfectly smooth, and in other places crystallized so as to glitter like diamonds in the light. Growing from this, in endless diversified forms, is a substance resembling selenite, translucent and imperfectly laminated. Some of the crystals bear a striking resemblance to celery, and all are of about the same length; while others, a foot or more in length, have the color and appearance of vanilla cream candy; others are set in sulphate of lime, in the form of a rose; and others still roll out from the base in forms resembling the ornaments on the capital of a Corinthian column. Some of the inercedations are massive and splendid; others are as delicate as the lily, or as fancy work of shell or wood." Proctor's arcade is a magnificent natural tunnel three fourths of a mile long and 100 ft. wide, covered by a ceiling of smooth rock, 45 ft. high. The Temple or Chief City is a chamber having an area of between four and five acres, and covered by a single dome of solid rock 120 ft. high. Lucy's dome, the highest of the objects of this class, is over 300 ft. high and about 60 ft. in its greatest diameter. Mammoth dome and Stella's dome are each about 250 ft. high, while Gorin's dome is about 200 ft. Sidesaddle pit, over which rests a dome 60 ft. high, is about 90 ft. deep and 20 ft. across. This and some of the other pits and domes in the cave have been formed out of the solid rock by the solvent action of water charged with carbo nic acid. The deepest of the pits are the Maelstrom, 175 ft. in depth and 30 in diameter, and the Bottomless pit, of about the same depth. There are several bodies of water in the cave, the most considerable being Echo river, which is about three fourths of a mile long, 200 ft. wide at some points, and from 10 to 30 ft. deep; its course is beneath an arched ceiling of smooth rock about 15 ft. high. This river has inivisible communication with Green river, the depth of water and the direction of the current in the former being regulated by the stage of water in the latter. The river Styx, 450 ft. long, 15 to 40 wide, and from 30 to 40 deep, is spanned by an interesting natural bridge about 30 ft. above it. Lake Lethe is about 450 ft. long and from 10 to 40 wide, and varies in depth from 3 to 30 ft.; it lies beneath a ceiling about 90 ft. above its surface; its waters sometimes rise to the height of 60 ft., in consequence of freshets in Green river. The Dead sea is a gloomy body of water somewhat smaller than the preceding. Two remarkable species of animal life are found in the cave, in the form of an eyeless fish and an eyeless crawfish, which are nearly white in color. Another species of fish has been found with eyes, but totally blind. Other animals known to exist in the cave are lizards, frogs, crickets, rats, bats, &c., besides ordinary fish and crawfish washed in from Green river. The atmosphere of the cave is pure and healthful; the temperature, which averages 50°, is about the same in winter and summer, not being affected by climatic changes without.—The Mammoth cave was discovered in 1809, and has always been the property of private individuals. For some time after its discovery saltpetre was made here. In this vicinity are the Proctor's cavern, the big cave, the Diamond, and Indian caves, each about a mile long. Several accounts of this wonderful curiosity have been published, the most recent and complete being "The Mammoth Cave," by W. Stump Forwood (Philadelphia, 1870). **MAN.** See ANATOMY, ARCHITECTURE, COMPARATIVE ANATOMY, ETHNOLOGY, MAMMALIA, PHILOSOPHY, AND PHYSIOLOGY. **MAN, Isle of** (Manx, Mannin, or Ellan Vannin; Lat. Monapia), an island belonging to Great Britain, in the Irish sea, about midway between England, Scotland, and Ireland, its centre lying in lat. 54° 16' N., lon. 4° 30' W.; length N. N. E. and S. S. W. 31 m., greatest breadth 12 m.; area 227 sq. m.; pop. in 1871, 54,042. The coasts are very irregular, and on the east and southwest are precipitous. There are numerous bays with good anchorage. A ridge of mountains traverses the length of the island, culminating in Mt. Snaefell at an elevation of 2,024 ft. above the sea. Its prevailing geological formation is clay slate, varied on the E. side with large masses of granite. The principal rivers are the Neb, Colby, and Black and Gray Waters, all of which are very small. The climate is mild and equable, the mean temperature of summer being about 60° F. and of winter 42°. The chief mineral resources of the island consist of lead, zinc, copper, and iron; lead is extensively mined. The soil is fruitful, but agriculture is not in a very forward state. Oats, barley, wheat, potatoes, turnips, and hay are the principal crops. A native breed of small sturdy horses, an inferior kind of sheep, horned cattle, and pigs in great number, are among the domestic animals. The island possesses a breed of cats having either no tail, or at most a very rudimental substitute for it. Sea birds and some rare kinds of bat are also found. The fisheries of herring were formerly the principal reliance of the islanders, but of late have become inconsiderable. There are
MANAGUA, a city and the capital of Nicaragua, and of the department of Granada, situated on the S. shore of the lake of the same name, 220 ft. above the level of the Pacific, in lat. 13° 7' N., lon. 86° 12' W.; pop. about 6,500, for the most part proprietors of the fertile lands which surround it, and which are productive in all tropical staples. The public buildings are few and devoid of beauty. The old parish church, which was in a state of ruin, has been demolished, and a new edifice is in process of construction; and there are four other churches. The national palace is a low square edifice with balconies in the Spanish style, the only ornate portions of which are the congress halls and those occupied by the president of the republic. A new structure beside the palace contains the cabildo or city hall, a prison, and barracks. The environs of Managua are very picturesque; on the declivities of the mountain range to the south there are more than 100 coffee plantations, yielding copious crops, despite the lack of water for irrigation in some of them; and in another direction are the lakes of Tiscaipa, Nejapa, and Asososca, near the banks of which last exist curious antique paintings. Managua owes its rank as capital chiefly to the rivalries of the cities of Granada and Leon, and partly to its central position.

MANAGUA, Lake, a beautiful body of water in Nicaragua, about 40 m. long by 16 m. wide, 137 ft. above the Pacific ocean, from which it is separated by a ridge of land 15 m. broad in its narrowest part. It has a depth of water varying from 2 to 40 fathoms; but numerous moving sand banks render its navigation difficult for large vessels. The N. and E. banks are unhealthy marshy deserts; the W. shores are sandy, interspersed with bold rocks; and there are several ports, that of Managua being the best, and the point designated for the inland terminus of the projected railway from the lake to the port of Corinto via Leon. It has an outlet at its S. extremity called Rio Tipitapa or Estero de Panaloya, connecting it with Lake Nicaragua. The difference of level between the two lakes, at average stages of water, is 28 ft. The Rio Tipitapa, during severe rainy seasons, has a considerable body of water; but it is frequently almost dry, the evaporation from the surface of the lake exceeding the supply of water from its tributaries, which are all intermittent streams, except Sinogapa and Rio Viejo. In the various projects for an interoceanic communication through Nicaragua, it has been proposed to connect the two lakes by means of a canal, deepening the Tipitapa and constructing a series of locks to the superior lake, with another canal from the lake to the port of Realejo, or by means of the Estero Real to the bay of Fonseca. Between the N. portion of the lake and the Pacific there is only the magnificent plain of Leon, having an elevation at its highest part of about 50 ft. above the level of water in the lake. The volcano of Momotombo projects boldly into the lake at its N. extremity, and within the lake itself rises the island cone of Momotombita, which had a sacred repute among the aborigines, and still contains numbers of their idols and other monuments, concealed beneath the shadows of its dense forests. The city of Leon was first built on the shore of the N. W. extremity of the lake, at a place called Imbita, abandoned for the present site in 1610.

MANAKIN, the name applied to the denticratal birds of the family ampeedeae or chattering and subfamily piprinae; they are generally small and of brilliant colors, and with one exception inhabitants of the warmer parts of South America. They have a moderate or short bill, depressed, with broad base, curved ridge, compressed sides, and tooted tip; the nostrils are hidden by the frontal feathers; the wings generally short and pointed; tail short and even; tarsi moderate and slender; toes long, the outer united to the middle to beyond the second joint; claws acute. The red manakin or chatterer (Phonicercus carnipes, Swainson) is
The small manakin of tropical America is of singular plumage; feathers are brown; the tail is arranged with end and outer web dusky brown; the female is of a general greenish olive color, with tinges of red on the head, abdomen, and tail; the young birds are brownish with whitish markings. This and the *Pipra nigricollis* (Swains.) inhabit the eastern parts of tropical South America.—The blue-backed manakin (*Pipra parvola*, Linn.) is 4½ in. long; the plumage is black, with the back and lesser wing coverts blue, and a crest of bright crimson feathers; the female and young are greenish. There are more than 30 other species. These beautiful and active birds inhabit damp woods, on the borders of which they live in small flocks, seeking for insects and fruits.—The rock manakins belong to the genus *rupicola* (Briiss.), of which the best known species is the orange manakin or cock of the rock (*R. crocea*, Bonn.); the plumage is saffron orange, with the quills partly white and partly brown, and the wing coverts loose and fringed; it has a singular crest of feathers arranged in two planes, arising from the sides of the head and meeting over and in front of the bill; the size is that of a small pigeon. This handsome species inhabits rocky places near the borders of the streams in Guiana, and its legs and feet are nearly as stout as in a gallinaceous bird of the same size, whence its common name; it is active and suspicious, feeding on fruits and berries; the nest is placed in holes in the rocks, composed of roots, grass, and earth, lined with finer materials; it lays two white eggs, about the size of those of a pigeon; it is now comparatively rare, as it is hunted for the beauty of its plumage. There is a species in Peru (*R. Peruviana*, Lath.), of a reddish saffron color, with black quills and tail, and ashy wing coverts; it is a little larger than the other.—The only old-world representative of this subfamily belongs to the genus *Calyptopterus* (Raffles), found in the thick forests of Java and Sumatra; the plumage is shining green, with a spot on each side of the nape, three oblique stripes on the wings, and the quills, except the outer margins, dark-colored. The only species described by Gray is the green manakin (*C. viridis*, Raff.), about 6 in. long; the color so nearly resembles the foliage of the high trees upon which it generally perches, that it is very difficult to see and to procure; its food is entirely vegetable.

**MANASSAS JUNCTION, Battle of.** See Bull Run.

**MANASSEH.** I. The elder son of Joseph, son of Jacob, adopted by the latter on his deathbed to become the head of one of the tribes of Israel, yet made inferior to his younger brother Ephraim. At the time of the census at Sinai the tribe of Manasseh numbered 32,200, and 40 years later 52,700. On the conquest of Palestine, half of the tribe received from Moses its allotment E. of the Jordan, N. of Gad, and the other half received from Joshua the region W. of the Jordan, between Issachar on the north and Ephraim on the south, the Mediterranean forming the western boundary. The eastern division contained among others the districts of Iturea, Trachonitis, Gaulonitis, Batanaza, and part of Gileaditis, and the towns of Gadara, Ashtaroth, Edrei, Gamala, Jabesh-Gilead, Mahanaim, and Gerasa. The western division was less important in history, it being almost always overshadowed by its southern neighbor, Ephraim. II. A king of Judah, 696–641 B.C. See HebReWs, vol. viii., p. 589.

**MANATEE, Laminatia, or Sea Cow,** a large aquatic mammal (**manatus**, Cuv.), which was arranged by Cuvier among cetaceans, forming with the dugong the herbivorous group of this order, the family *sirenia* of Illiger. Recently, on account of the many important differences in their organization, they have been removed from cetaceans and placed in an order called sirenoids, intermediate between the old order of pachyderms and the cetaceans. The manatee has an elongated, fish-like body like that of the whales, the anterior limbs be-
MANATEE

there are two sharp incisor teeth in the upper jaw, which after ward fall out; there are no canines; the molars are generally 2-8, with quadrangular flat crowns, divided by a transverse groove. The bones are dense and heavy, differing in this from cetaceans; the ribs are numerous and rounded; the mammae are two and pectoral; the intestinal canal is 10 or 12 times the length of the body, in accordance with the vegetable character of their food; the stomach has two cecal appendages in the pyloric portion, which is separated from the cardiac by a constriction. They inhabit the sea shores, especially about the mouths of rivers, and the rivers themselves, keeping near the land, feeding upon alge and aquatic plants; they do not feed upon the shores, though they sometimes quit the water, and not unfrequently support themselves in the shallows in a semi-erect position; under these circumstances they present at a distance somewhat of human appearance, increased by the distinct lips, the long whiskers in the male, and the pectoral mammae in the female. The largest and best known species is the Florida manatee (Manatus latirostris, Harlan), which inhabits the Gulf of Mexico and the West Indies; it sometimes attains a length of 15 or 20 ft., but is generally about 12. They are usually seen in small troops, associating for mutual protection and for the defence of their young; they are harmless even when attacked, of gentle disposition, not afraid of man, and rarely quarrelling with each other. Being found only in shallow waters, they are easily captured. Their flesh is wholesome and palatable. The South American manatee (M. australis, Wiegm.), usually 9 or 10 ft. long, is not uncommon about the mouths of the great rivers of northern Brazil and Guiana; it ascends the streams several hundred miles, and even into inland fresh-water lakes; the flesh of this aquatic mammal is considered fish by the Roman Catholic church in Brazil, and may consequently be eaten on fast days; salted and dried in the sun, it is an excellent meat; the oil from the blubber is of fine quality, and free from smell; the hide is made into harnesses and whips, and is noted for strength and durability. An African species (M. senegalensis, Desm.) is rarely more than 9 ft. long. The manatees are all tropical, but are not found in the Pacific or Indian oceans, their place being there taken by the allied dugongs (halicore, Illiger).—There was among the Russians an animal called the northern manatee or sea cow; this is the creature described by Steller, forming the genus rhynia (III.) or Stellera (Cuv.). This, the R. Stelleri (Desm.), was unknown before 1741, when Behring's second expedition was wrecked on an island in the straits bearing his name; its flesh formed the principal food of the shipwrecked mariners for nearly a year; one of the party, Steller, described the animal, and his account was published in St. Petersburg, and probably contains all that will

Manatee (Manatus latirostris).

symmetry of the cranial bones and their usual position; the shape of the jaws, and the character of the molars; and the structure of the stomach and heart. Many other distinctions are given in the "Proceedings" of the third meeting of the American association for the advancement of science, Charleston, S. C., 1850 (pp. 42-47). The head is conical, without a distinct line of separation from the body; the fleshy nose much resembles that of a cow, the nostrils opening as usual on the end of the snout; the full upper lip has on each side a few bristly tufts of hair; the mouth is not large, and the eyes are small; the openings of the ears are very small. The swimming paws are more free in their motions than in cetaceans, and may be used also for crawling up the muddy banks of the rivers in which they dwell; the separate bones may be felt through the skin, and the fingers are provided with small nails. The skin is of a grayish black color, becoming black on drying, with a few scattered bristles. In the young animal

ing flattened into fins, and the posterior limbs wanting and only represented by a rudimentary pelvis; the tail is oval, about one fourth of the extent of the body, ending in a flattened, horizontal, rounded caudal expansion; in these respects it resembles cetaceans. It differs from cetaceans in the separation of the cervical vertebrae; the smaller total number in the whole column, and the absence of osseous disks between the bodies; the articulation of the ribs to two vertebral bodies and to transverse processes; the long and narrow scapula; the regularly shaped humerus; the rounded radius and ulna; the compact structure of the phalangeal bones; the wide separation of the occipital condyles, and their partly horizontal position, and the large size of the occipital foramen; the well marked and strong sutures, and the absence of internal bony falces; the fusion of the parietals into one; the position of the frontals as usual in front of the parietals; the strong zygomatic arches; the
ever be known concerning it, as in 1768 the crews of the ships in pursuit of sea otters had entirely exterminated it; it has not met the fate of the dodo; but at a much more recent period, a skull and a few fragments are said to exist in European museums. It had no teeth, the jaws being covered with an undulating surface of horny tubular matter; the head was small, the body covered with a thick, fibrous, fissured epidermis, and the caudal fin lanunate. It attained a length of 25 ft., and formerly lived in the neighborhood of Behring island on the coast of Kamchatka. The epidermis had a singular structure, being composed of perpendicular horny tubes, sometimes an inch in length, of a blackish brown color, rough and wrinkled like the bark of a tree, and so tough as to be with difficulty cut with an axe; it served to protect the animal from the ice and sharp rocks among which it fed. They lived in shallow water in troops, the older protecting the younger; they were harmless and very tame, and strongly attached to each other; they fed on fuci under water, and the skin, fat, and flesh were esteemed by the natives.

**MANATEE.** A S. W. county of Florida, bordering on the gulf of Mexico, touching Lake Okeechobee at the S. E. corner, bounded S. by the Caloosahatchee river, and watered by the Manatee river, Peaso creek, and other streams; area, 4,070 sq. m.; pop. in 1870, 1,931, of whom 88 were colored. Along the coast are numerous low sandy islands, within which lie Sarasota bay and Charlotte harbor. The surface of the mainland is level and low, and not very fertile. The chief productions in 1870 were 12,727 bushels of Indian corn, 21,632 of sweet potatoes, 29 bales of cotton, 41 hogheads of sugar, and 71,452 lbs. of rice. There were 330 horses, 44,970 cattle, and 5,197 swine. Capital, Manatee, or Pine Level.

**MANAVUNK.** See PHILADELPHIA.

**MANBY, George William,** an English officer, born at Hilgay, Norfolk county, Nov. 28, 1765, died at Southtown, Nov. 18, 1854. He was educated at the military college of Woolwich, and became in 1803 barrack master at Great Yarmouth. Here he attempted casting a rope from the shore to a wreck by means of gunpowder. The problem to be solved was the maintenance of the connection between the rope and the mortar during its transmission. Chains were unable to stand the shock of the discharge, but stout strips of raw hide closely platted together were found to answer; and on Feb. 12, 1808, the entire crew of the brig Elizabeth, wrecked within 150 yards of the beach, were rescued by this simple contrivance. In 1810 his invention was brought before a committee of the house of commons, and he received a grant of money, and all the dangerous stations on the British coasts were supplied with his apparatus. He also contrived a pyrotechnic which renders vessels visible from shore on the darkest night; and shells filled with luminous matter, to enable the crew to perceive the approach of the rope. He published "The History and Antiquities of the Parish of St. David, South Wales" (1801), and kindred works; also "Journal of a Voyage to Greenland in 1821" (1822).

**MANCHA, la,** an old province of Spain, chiefly in the S. part of New Castile, now included in the central and eastern portions of Ciudad Real, and the adjoining parts of Cuenca and Albacete; area, about 7,000 sq. m.; pop. about 200,000. The N. and S. portions are mountainous and the centre in general a desolate sandy plateau. The towns are few and uninteresting; the cottages in the villages are built of mud. Most of the country is composed of trees, exposed to the wintry blasts, and scorched by the summer heat. The earth is arid and stony; the dust is impregnated with saltpetre, and the glare of the sun almost blinds the eye. Water is wanting, and dry dung is used for fuel. In some places, however, corn, saffron, and wines are produced; and the mules of La Mancha are celebrated. The natives are jovial, honest, industrious, brave, and temperate. The scenery has become celebrated by the descriptions in "Don Quixote."

**MANCHE, la,** a N. W. department of France, in Normandy, bordering on the English channel and the departments of Calvados, Orne, Mayenne, and Ille-et-Vilaine; area, 2,289 sq. m.; pop. in 1872, 544,776. The coast is generally flat, and lined with swamps. There are several excellent harbors, the principal of which are Cherbourg, La Hogue, and Granville. La Manche has several short but navigable rivers, the principal of which is the Vire, and is traversed from N. to S. by a hilly range of moderate height, called Cotentin, which gives its name to the southern portion of the department. The rest of the surface is undulating, the soil rich, and the climate moist and mild. A prevailing crop is a species of black oats. The quantity of cider made is very great. A considerable portion of the land is under pastureage. The horses are among the best in France. Iron, lead, and coal are mined, and granite, marble, slate, and limestone are quarried. Salt is largely manufactured on the coast, and in the towns iron, zinc, copper, woollen, and cotton. The department is divided into the six arrondissements of St. Lô, Avranches, Cherbourg, Coutances, Mortains, and Valognes. Capital, St. Lô.

**MANCHESTER,** one of the shire towns of Hillsborough co., New Hampshire, and the largest city in the state, situated on both banks (but chiefly on the E.) of the Merrimack river, 18 m. S. by E. of Concord, and 46 m. N. W. of Boston; pop. in 1850, 13,932; in 1860, 20,107; in 1870, 23,536, of whom 7,158 were foreigners, including a considerable number of French Canadians. The villages of Amoskeag and Piscataquog are on the W. side of the river, which is crossed by five bridges. The city is regularly laid out in squares, and the main street is 100 ft. wide, planted with elms on each side at in-
tervals of 40 ft. for more than a mile. There are five public squares of considerable extent in the central portion, three of them containing ponds. Valley cemetery, the largest in the city, is situated in the S. W. part, E. of the Merrimack; and there are two small cemeteries W. of the river. Manchester has railroad communication with Boston, Concord, Portsmouth, and other points, by means of the Concord, the Manchester and Lawrence, the Manchester and North Weare, and the Portsmouth railroads. It is one of the principal manufacturing cities of New England, being supplied with ample water power by the Blodgett canal, built in 1816 around the Amoskeag falls in the Merrimack. The fall is 47 ft., with rapids above, giving a total descent of 54 ft. in the space of a mile. The water power is owned by the Amoskeag manufacturing company, which has a reservoir in the N. E. part of the city capable of holding 11,000,000 gallons, for supplying the mills. The following table exhibits the statistics of the five corporations engaged in the manufacture of cotton and woollen goods in 1874:

Of the operatives, 2,700 were males and 6,300 females. The Amoskeag company also manufactures steam fire engines, and the Manchester company operates extensive print works. The Manchester and Namaske companies manufacture woollens as well as cottons, and the Stark mills some linens; the others, only cotton goods. The principal kinds of goods are tickings, denims, stripes, ginghams, sheetings, shadings, print cloths, balmorals, cotton linens, cotton duck, seamless bags, delaines, angola flannels, fancy cassimeres, alpacas, poplins, silesias, &c. The Amoskeag paper mill employs about 40 hands. There are also a manufactury of hosiers, one of boots and shoes, one of edge tools, one of locomotives, several of machinery and iron castings, of carriages, and of circular saws, a brass foundry, and an ale brewery. The city contains four national banks, with an aggregate capital of $650,000; five savings banks, with about 18,500 depositors and $7,250,000 deposits; and a fire insurance company, with $200,000 capital. It is divided into seven wards, and is governed by a mayor and a board of aldermen of one member and a common council of three members from each ward. There is an efficient police force, and the fire department is well organized. The streets are well paved and sewered and lighted with gas. Water is supplied from Lake Massabesic on the N. E. border of the city by works recently erected. The assessed value of property in 1873 was $12,001,200; tax, $300,768; value of city property, $717,120 45; net debt, Jan. 1, 1874, $807,860 16. Manchester is the seat of the state reform school, which occupies a brick building on the E. bank of the Merrimack, capable of accommodating 150 inmates. The public schools are in a flourishing condition, and in 1873 embraced 45 departments (1 high, 1 training or normal, 6 grammar, 6 middle, the rest primary or ungraded); number of teachers, 59; pupils en-rolled, 3,779; average attendance, 2,284; cost of maintenance, $49,063 17, including $36,-451 58 for teachers' wages; value of school property, $249,675. Besides these, evening schools are maintained during a portion of the year, and there are several Catholic schools connected with the churches and convent. The latter also conducts an orphan asylum. The city library at the close of 1873 contained 17,672 volumes. Two daily and three weekly newspapers and a monthly periodical are published. The number of churches is 16, viz.: 2 Baptist, 1 Christian, 2 Congregational, 1 Episcopal, 2 Freewill Baptist, 2 Methodist, 3 Roman Catholic (1 French), 1 Second Advent, 1 Unitarian, and 1 Universalist.—The place was first settled near the falls about 1752, incorporated under the name of Derryfield in 1761, and named Manchester by act of the legislature in 1810. It received a city charter in 1846. MANKCHESTER, a town of Hartford co., Connecticut, on the Hartford, Providence, and Fiskhill railroad, 5 m. E. of Hartford; pop. in 1870, 4,223. It contains extensive manufactories of book, government, and bank-note paper, of woollens and ginghams, print works, a silk factory, several carriage factories, &c. A weekly newspaper is published. The paper mills are at North Manchester, 3 m. from which is South Manchester, which has grown up around the Cherry silk works, the most extensive in America. Dress silks and sewing silks are manufactured in immense quantities, by ingenious machinery, much of which was invented solely for use here. The cocoons are imported, and all the work of spinning, weaving, and dyeing is done here. The village was laid out by a landscape gardener; there are no fences, and pigs and poultry are prohibited. It is lighted with gas. There is a handsome public hall, with a library and reading room, and a free school to which the operatives are required to send their children.
MANCHESTER

MANCHESTER (anc. Mancunium), the most important manufacturing city in Great Britain, situated in the S. E. corner of Lancashire, on both sides of the river Irwell, 162 m. N. W. of London, and 31 m. E. by N. of Liverpool. It consists of Manchester proper, including several suburbs on the E. bank of the Irwell, and the borough of Salford on the W. bank; pop. in 1871, 475,990, of whom 351,189 were in Manchester city, and 124,801 in Salford (exclusive of suburban districts not lying within the municipal limits). The two towns, although having distinct municipal governments, constitute in all other respects one city. They are connected by eight bridges, among which are the Victoria, of a single arch, and Blackfriars, of three arches, of stone; the bridges of Strange- ways and Springfield Lane, of iron; and the iron suspension bridge of Broughton. The streets are intersected by numerous canals, crossed by bridges, and are generally well paved and lighted; but the site is low, and notwithstanding the recent improved drainage and the introduction of an abundant supply of pure water, Manchester is still one of the most unhealthy places in the kingdom, the annual death rate being about 3·2 per cent. A portion of the place still presents an antiquated appearance, but there are many handsome streets, such as Market street, Portland place, Grosvenor square, Mosley street, George street, King street, Ardwick green, Salford crescent, &c.

There are several handsome public parks and gardens, of which the most important are the botanical and horticultural gardens; the Peel park, on the Irwell, with an area of 32 acres; Victoria park, between London and Oxford roads, a space of 140 acres, covered with villas; the Queen's park, Phillips park, and Alexandra park, opened in 1870. The buildings devoted to business and manufactures have generally an imposing appearance. A marked change has been made of late years in the architectural character of the city. New squares have been laid out, new streets opened, and commercial buildings of a more ornamental appearance have been erected. In Manchester proper, in 1872, there were 168 places of worship, of which 8 were Baptist, 51 Church of England, 26 Independent, 45 Wesleyan and other Methodist, 12 Roman Catholic, 9 Presbyterian, and 5 Unitarian; including Salford, the whole number exceeds 200. The parish church, commenced by Lord Delaware in 1422, and since 1847, when Manchester became a bishopric, the cathedral, is a highly ornammented Gothic structure, 216 ft. long and 120 ft. wide; but being built of a soft and mouldering stone, many repairs have been necessary, which give the structure a modern appearance; it has within a few years been restored at a great expense, and a new tower has been added to replace the old one, which was found incapable of restoration. There are several other handsome churches, among which are St. George's, in the suburb of Hulme, and the Roman Catholic cathedral of St. John, in Salford. Trinity church in Salford, the oldest in the borough, has a fine Gothic tower, and is interesting from the antique aspect of the interior. The old town hall, in King street, is in the Grecian style, and contains a hall 130 ft. long by 38 ft. wide, having its walls and dome covered by allegorical frescoes; but having become inadequate to the needs of the city, a new town hall, commenced in 1868, has been completed at a cost of £250,000. The new exchange is an Italian edifice, with a porch flanked by two towers, the great hall having a clear breadth of 120 ft. The corn exchange is an Ionic structure capable of holding 2,400 persons.

The free-trade hall, somewhat irregular but large and effective, occupies the site of the old free-trade hall, and like it is noted in the history of Manchester as the place of several important political meetings. The new building, erected in 1856, occupies an area of 20,700 sq. ft.; it contains a hall 134 ft. long, 78 wide, and 52 high, and will hold 5,000 persons. The Salford town hall is one of the handsomest buildings in the town. The new royal exchange has a handsome front with Corinthian columns; its great room is 207 ft. long, 103 wide, and 80 high; the roof is supported by two rows of pillars, with a span of

Royal Exchange, Manchester.
nearly 100 ft. between them. The new assize courts were opened in 1864; the building is Gothic, 270 ft. long and 140 deep, with a tower 210 ft. high. The branch bank of England, opposite the town hall, is a fine structure, in the Grecian style, with a Doric colonnade. The royal infirmary, erected in 1755, is built on three sides of a quadrangle, each with a portico supported by four fluted Ionic columns, the whole surrounded with grass borders and walks, with a sheet of water in front; it has an income of £39,000, and annually relieves more than 20,000 patients. Among the other notable public buildings are the court halls, the jails, and the asylum for the blind and the deaf and dumb. In front of the new town hall is the Albert memorial, including a statue of Prince Albert. Two statues of Richard Cobden were erected in 1867, one in St. Anne's square, the other in Peel park. In front of the royal infirmary is a statue of Dalton; and there are also statues of Watt, Wellington, and Peel. Among scientific, literary, and art associations are the royal Manchester institution, occupying buildings which cost £40,000, and devoted to the exhibition of paintings, lectures, &c.; the mechanics' institution, founded in 1825, for which a new edifice was erected in 1856, established for the instruction of the working classes, male and female, in the principles of the arts they practise and in other branches of useful knowledge; and natural history, botanical, horticultural, geological, statistical, and medical societies. The royal school of medicine and surgery, founded in 1824, has 80 to 100 students. The literary and philosophical society, established in 1781, has numbered many distinguished members, and has issued several volumes of valuable transactions. The Chetham society, established in 1843, has published 22 volumes of historical and literary remains. There are many public libraries. The free library, founded by voluntary subscription, and maintained by a municipal rate, has four branches, and is divided into two departments, reference and lending, each having about 40,000 volumes. A free library of about 25,000 volumes is attached to Chetham's hospital, or the "College" as it is now simply called, an institution founded in 1651 by Humphrey Chatham, for the education of poor boys. Owens college was founded in 1846 by the munificence of a merchant of the city, who bequeathed for the purpose more than £100,000, which has of late been considerably enlarged by means of a fund raised by public subscription; it issues certificates to candidates for the degrees of bachelor of arts and bachelor of laws, to be conferred by the university of London. The Lancashire Independent college was established by the Independents as a theological seminary, and will accommodate 50 students. Manchester New college, Unitarian, founded in 1786, was removed to London in 1857; and in 1856 Memorial Hall was erected in Manchester as a Unitarian college. There is a free grammar school founded by Hugh Oldham, bishop of Exeter, in 1515-'25. The Jubilee school trains pupils for domestic service.—Manchester is supplied with water from a "gathering ground," about 24 m. distant, of nearly 20,000 acres. The reservoirs form a series of 10 artificial lakes of a capacity of 600,000,000 cubic ft. The pure water only is supplied to the city, the turbid water being collected in separate reservoirs and used for mill purposes. The water is conveyed in aqueducts 12 m. to Godley, thence to
two reservoirs at Denton, and then 4 m. to Manchester. The works are capable of furnishing 40,000,000 gallons daily, and their cost was about £1,050,000. Manchester is the centre of a great system of canals, and has railway communication with nearly all parts of England. The Liverpool and Manchester line was the first railway on which was attempted the practical application of steam power for the transportation of passengers.—The borough of Manchester, comprising besides the city itself the townships of Charlton-upon-Medlock, Halme, Ardwick, and Chetham, with the extra-parochial district of Beswick (total pop. in 1871, 379,374), was incorporated by royal charter in October, 1838. The management of its local affairs is intrusted to a town council of 64 members, styled respectively mayor, aldermen, and councillors, who appoint from their body committees for the transaction of public business, who report their proceedings for approval at the general meeting of the council. This council have introduced many valuable improvements, notable among which are the water works; it is anticipated that when these are fully completed, the sale of water for the purposes of trade will be sufficient to defray the entire expense, leaving free that required for domestic purposes. The gas works are also under control of the council, and notwithstanding the price of gas has been frequently reduced, there is a profit of about £35,000 a year, which is expended in improving and widening the streets. In 1846 the town council purchased from Sir Oswald Mosley his manorial rights for £260,000, of which £165,000 was left on mortgage at an interest of 3½ per cent.; the income from this property now amounts to £16,000 a year. The borough formerly returned two members to parliament, but by the reform act of 1867 the number was raised to three. The borough of Salford, constituted by the reform act of 1832, returns two members to parliament. It is governed by a mayor, 8 aldermen, and 24 councillors.—Manchester has from a very remote period been connected with industry and trade; but its present great importance is specially due to the magnitude of its cotton manufactures, the greatest in the world. It is mentioned as having maintained a trade with the Greeks of Massilia (Marseilles). In 1552 an act was passed for the better manufacture of "Manchester cottons;" and in 1650 its manufactures ranked among the first in extent and importance, and its people were described as "the most industrious in the northern parts of the kingdom." The inadequate supply of cotton goods about the middle of the last century stimulated efforts for increasing the means of production; and the machines successively invented by Leigh, Hughes, Arkwright, Hargreaves, and others, had their efficiency vastly increased by the steam engine of Watt. The value of the exports of the cotton industry in 1780 was £555,060; it rose in 1781 to £1,104,457, and in 1856 it had reached upward of £28,000,000. The imports of raw cotton in 1751 were to the amount of 2,976,610 lbs.; in 1780, upward of 6,700,000; in 1800, 56,000,000; and in 1860, 1,115,890,608. In 1857 an advance in the price of American cotton caused the formation in Manchester of the cotton supply association, to procure the staple from other countries. After the outbreak of the civil war in the United States, Manchester suffered severely from the cotton famine, and in 1862 more than one third of the operatives were thrown out of employment. At the close of the war there was a renewal of activity, though the import of United States cotton in 1870 was but little more than half the supply from the same source in 1860. Sole reliance, however, is not now placed on the American supply. During the war the machinery of many of the mills was altered to adapt it to the fibre from India and Egypt, and these mills still continue to use to a large extent the cotton from those countries. Connected with the cotton manufacture are many important and extensive branches of industry, such as bleaching, printing, and dyeing works, manufactures of the various materials employed in those processes, and particularly the great establishments for the construction of steam engines and machinery. It is also the chief market in the world for cotton yarn or thread, the supply of which passes through the hands of numerous resident foreign merchants, who export it to their respective countries, giving to Manchester in this respect a character quite unique among inland cities. The manufacture of silk and silk goods, and of mixed cotton and silk fabrics, is also largely carried on. The following table, furnished by the inspector of factories, presents the statistics of the manufacturing industry in 1871:

—The site of Manchester is mentioned as a chief station of the druids, who had there an altar called Meyne. In A.D. 500 it was an unfrequented woodland. In 620 it was taken by Edwin, king of Northumbria, and shortly after occupied by a colony of Angles. It then passed to the Danes, who about 920 were expelled by the king of Mercia. The charter conferring the privileges of a borough was granted in 1301. Manchester cotton is first mentioned in 1359, by which was meant, however, a coarse woolen cloth woven from unprepared fleece. In 1579 the manor was sold to John Layce, a London cloth-worker, for £3,000, and resold in 1596 to Sir Nicholas Mosley for £3,500. At the time of the civil war it was distinguished for active industry, and suffered much from both parties. On Jan. 8, 1819, a great radical meeting was held at St. Peter's field; and another great meeting attended by 60,000 persons, on Aug. 16 of the same year, was dispersed by the yeomanry cavalry, eight persons being killed. In 1857 an exhibition was held from May to October for the display of the art treasures of the kingdom. Among the objects exhibited were 1,115 paintings, 969 water-color drawings, 160 specimens of modern sculpture, 260 original sketches and drawings by the old masters, and a museum of ornamental art comprising 17,000 choice specimens.

MANCHINEEL (Hippomane mancinella), a poisonous evergreen tree growing wild in the West India islands, along the shores of the Caribbean sea, and in southern Florida. It is of the natural order euphorbiaceae; and the name hippocrene (Gr. πτερος, horse, and μαύλωκας, to be mad) is given to the genus from the supposed maddening effect of its juice upon horses. The manchineel tree grows to the height of 40 or 50 ft.; it has a smooth brownish bark, and short and thick branches. The leaves are about 3 in. long and half as wide, with two glands at the junction of the blade with the short footstalks; the flowers grow in short thick spikes at the end of the branches; the fertile flowers are solitary at the base of the spikes, and the staminate ones in small clusters at its apex; both kinds are obscure and without petals. The fruit when ripe is of a yellow color, and resembles an apple in appearance; hence it is called manzanillo (little apple), a name that in Spanish American countries is applied to several plants bearing fruit like an apple, or the leaves and flowers of which have an apple-like odor. Some early accounts state that this tree is more deadly poisonous than the upas, asserting that grass would not grow beneath it, that death would follow sleeping under its shade, and that a drop of its juice falling upon the skin had the same effect as the application of red-hot iron. While the milky juice of the tree is highly poisonous, investigations have shown the earlier reports to be greatly exaggerated, and that, like our poison sumach, it affects some persons more seriously than others. Those who, not knowing its character, have inadvertently tasted of the fruit, have suffered from severe blistering of the lips. The juice as well as the smoke from the burning wood produces temporary blindness. Berthold Seemann, the botanist, was blind after gathering specimens, and a boat's crew of his ship, the Herald, were blind for several days from having used some of the wood in making a fire. On account of the beauty of the brown and white wood when polished, it is much used for cabinet work. It is said that before striking the axe into the trees the workmen take care to light fires around them in order to thicken the juice and drive off the volatile poisonous quality; and cabinet makers also when working it protect their faces with veils from the poisonous effects of the saw dust and exhalations from the wood.

MANCHOORIA. See MANCHOORIA.

MANCINI, a Roman family, founded in the 14th century by Pietro Omni-Santi, surnamed Mancini dei Luci. Among his descendants was Michele Lorenzo Mancini, a brother of Cardinal Francesco Maria Mancini, who mar-
ried in 1634 a sister of Cardinal Mazarin. His daughters became prominent, according to Michelet, as "a battalion of Mazarin's nieces, brought up under the cynical influence of Christina of Sweden, and for whom one of their brothers, the duke de Nevers, had a more than brotherly love." 1. Laure (1635–57), the least dissolute of the five sisters, though her beauty captivated many persons, among whom was the young Louis XIV., married the duke de Mercœur. One of her two sons, the duke de Vendôme, became a famous warrior. II. Olympe (1639–1708), called on account of her dark complexion and mischievous disposition "black soul and black face," was a mistress of Louis XIV. Her uncle found a husband for her (1657) in Eugène de Carignan, of the house of Savoy, who was on his mother's side a French prince of the blood royal, and for whom the cardinal revived the title of count de Soissons. Though superseded for a time in the king's favor by her sister Marie, she soon regained her ascendancy, and they lived openly together. Her husband died suddenly in 1673, and it was suspected that she poisoned him. In 1679 she was compromised by the revelations of the poiser Voisin. But she was considered to have been innocent as regarded the death of her husband, to whom she had borne eight children, and nothing was proved against her in connection with Voisin. She was however prosecuted by Louvois and fled to Brussels, where she barely escaped being mobbed, and spent the rest of her life in various countries. While in Spain, where she met her fugitive sister Marie, King Charles II. attributed the sudden and premature death of his wife, Louise of France, to the frequent and clandestine visits which Olympe had paid to the queen in her illness, and to some milk which she had prepared for her shortly before her death. The celebrated soldier Prince Eugène of Savoy was one of her five sons, and she had three daughters. III. Marie (1640–1715) became an adept of St. James's place, where gambling and dissipation became the order of the day. The Swedish count Bannier, another lover of hers, was killed in a duel by her nephew, the chevalier de Soissons, who, though a mere boy, was madly in love with his aunt. After the revolution of 1688 her pension was cut off, and she was accused of complicity in Jacobite plots. But William III. restored to her one half of her former English pension, and permitted her to remain in England, and she ended her life at Chelsea. Lafontaine celebrated her in verses, giving her credit not only for all imaginable fine qualities of person, mind, and heart, but also for being adored from one end of the world to the other, and to such an extent as to create jealousy between England and France. V. Marie Anne (1649–1714) reached Paris only in 1655, much later than her sisters. She was also prosecuted as an associate of the poisoner Voisin, and did not live long with her husband, Maurice Godet de la Tour, duke de Bouillon, a nephew of Turenne, whom she had married in 1662. She retired to the palace of Château-Thierry, where she became the patroness of Lafontaine. Subsequently, after her husband's death, she made her home a literary centre, with Molère and the aged Corneille among the habitués. Like her father and all her sisters, she dabbled in necromancy as well as in poison, and was obliged to leave Paris in 1680. She lived for eight years with her sister the duchess of Mazarin in England; and after spending two years in Venice and Rome she was permitted in 1690 to return to Paris, where her society was courted to the last by eminent men of letters.

MANGINI. Pasquale, an Italian statesman, born in Naples about 1815. He took his degree at the university of his native city, where he became professor of jurisprudence. In 1848 he was a member of the Neapolitan parliament, and drew up the protest against the king's violent proceedings of May 15. To escape from the vengeance of the king he fled to Turin, where he was appointed professor of international law, which gave him an opportunity to urge the rights of nationalities; be
MANCO CAPAC

was also elected to the Sardinian chamber. In 1860 he became minister of justice and religion at Naples, and was a leader of the liberal party in the first Italian parliament, which met in 1861. In 1863 he was for a time minister of education in the cabinet of Rattazzi. He has published *Diritto internazionale* (Naples, 1873). II. Laura Beatrice Oliva, an Italian poetess, wife of the preceding, born in Naples in 1829. She devoted the early part of her life to her invalid father, to whom she was indebted for her education. In 1840 she married against the wish of her relatives, and wrote a play entitled *Ines* founded upon the romantic circumstances of this alliance, which was performed in Florence in 1845. In 1846 appeared her poem *Colombo al convento della Rabida*, and a volume of miscellaneous poetry. In 1851 she addressed a poem to Mr. Gladstone in gratitude for his revelations in regard to the Neapolitan government; and one of her finest poems was elicited by the death of Gioberti (L'Italia sulla tomba di Vincenzo Gioberti, Turin, 1858). Upon the establishment of the kingdom of Italy she composed several poems for patriotic celebrations.

**MANCO CAPAC.** I. The mythical ancestor of the incas of Peru. (See PERU, and QUICHOAS.) II. Inca of Peru, killed in 1544. He was the second son of the inca Huayna Capac, the conqueror of Quito, who died shortly before the arrival of Pizarro, dividing his kingdom between his legitimate successor Huascar and a younger son Atahualpa. The latter, after having made war upon Huascar and put him to death, was himself captured and executed in 1533 by Pizarro, who then set up Topara, a brother of his victim, as a nominal sovereign, under whose name the conquerors might themselves direct the government. Topara died within the year, and shortly afterward Manco Capac appeared in the Spanish camp to announce his pretensions to the throne and claim Pizarro's protection. The conqueror received him cordially, and made it his first care after the taking of Cuzco to place him on the throne. After in vain petitioning for power to exercise the sovereignty, he withdrew secretly from Cuzco, but was overtaken, brought back, and imprisoned. Again escaping, he roused the whole nation to arms, and appeared before Cuzco in February, 1536, with a host of Indians who covered the surrounding hills. He destroyed a large part of the city by fire, and reduced the Spaniards to extremities; but after the siege had lasted more than five months, he had to draw off most of his followers on account of the scarcity of food, and retired to the fortress of Tambo in the valley of the Yucay. Defeated here by Almagro, and forsaken by most of his warriors, he fled to the Andes, and for several years remained a terror to the Spaniards, hovering over their towns, lying in ambush on the highways, sallying forth as occasion offered at the head of a few followers, always eluding pursuit in the wilds of the Cordilleras, and in the event of civil war among the foreigners throwing his weight into the weaker scale in order to prolong their contests. Pizarro attempted to negotiate with him, and sent him rich presents by an African slave. The negro was murdered on the way by some of Manco's men; and Pizarro in revenge caused one of the monarch's wives to be tied naked to a tree, scourged, and shot to death with arrows. The Spanish rulers who succeeded Pizarro, down to Blasco Nuñez, bore orders from the crown to conciliate the formidable chief, but he refused all offers of accommodation. He was killed by a party of Spaniards belonging to the younger Almagro's faction, who on the defeat of their leader had taken refuge in the Peruvian camp. They were in turn massacred by the Indians.

**MANDAMUS,** the name of a remedial writ, belonging to a once extensive class of precepts, which bore the generic name of mandamus. They derived their name from the significant word of the mandatory clause, which, while the writs were framed in Latin, ran: *Nos igitur tibi mandamus, &c.* "We therefore command you." Their origin is referred to that clause of Magna Charta which declares that to no man will the king refuse or delay justice: *Nulli negabimus aut differemus justitiam vel rectum.* At a very early period, the injunction was in form nothing but a letter from the sovereign. Subsequently it became a parliamentary writ, and issued on petition from the king and his council. Later the king's bench took jurisdiction, which in the recent judicial changes in England has been transferred to the supreme court. The writ is directed to persons, corporations, or courts of inferior jurisdiction, and requires them to do some specific act which belongs to their official duty, or which exact justice demands. In this country the power to grant it is vested in the supreme judicial authority of the state, but in some states, also, in inferior courts. Not only does it form a branch of that general supervisory control which the sovereign power must possess over tribunals, magistrates, and all indeed who in any sense are invested with public functions; but also, as it was originally contrived to prevent failure of justice and to remedy defects of police, it is to be awarded in cases for which the law affords no specific and adequate remedy, yet where justice requires that there should be one. By the judiciary act of 1793 the United States supreme court received power to issue writs of mandamus in cases warranted by the principles and usages of law "to any courts appointed or persons holding office under the authority of the United States;" but in Marbury v. Madison, 1 Cranch, 137, the latter clause was held to be unconstitutional and void, and the supreme court refused to grant the writ to compel the secretary of state to deliver a civil commission alleged to be illegally withheld by him. Circuit courts, too, were authorized to issue the writ
when necessary for the exercise of their jurisdiction. The award of the writ is generally a matter of judicial discretion. He who seeks this remedy must show that he is innocent of laches, that he has a clear right in the premises, that there has been a distinct refusal to do that which the petitioner would compel, and finally that he has in the ordinary processes of law no adequate remedy. The most common practice is for the court in the first instance to issue a writ to commanding to be done that which is prayed for, or that the respondent show cause why it should not be done; or an order may issue in the first instance that the respondent show cause why a peremptory mandamus should not issue. In either case the defendant makes answer, and if the petitioner, who is usually called relator, is satisfied with the statement of facts in the answer, he will demur thereto, and the question will thus be referred to the court on an issue of law. If the relator is dissatisfied with the statement of facts in the answer, he may join issue thereon, and this issue of fact will be tried as the court may direct. If either issue is decided in favor of the relator, a peremptory mandamus is awarded. In a very clear case the peremptory writ may issue in the first instance. When directed to a court, the writ merely sets such court in motion; it bids it exercise a power which is vested in it. It does not presume to revise the decision of the inferior tribunal upon a question either of fact or law addressed to its judgment. As examples of this jurisdiction, mandamus has been granted to compel the sealing of a bill of exceptions or its amendment according to the truth of the case; or, at suit of a defendant, to require the inferior court to enter judgment upon a verdict, in the regular course of proceedings, in order to enable the defeated party to bring his writ of error. But the writ does not lie to control courts in respect to matters of practice under their rules, where their authority is discretionary. Mandamus often lies to commissioners of highways and supervisors of counties, commanding them to perform the peculiar duties of their office; ordering them, for example, to open a road regularly laid out; to estimate the damages caused to landowners thereby, or to levy a tax as they were required by law to do for the payment of damages caused by laying out a highway. Corporations, too, are often commanded by this process to do what their constituent acts require. Thus railway corporations have been compelled to pursue, in crossing rivers, the mode prescribed in their charters, and have been forbidden to obstruct navigation by the location of their track. Re- tiring public officers may also be compelled by this writ to deliver official books and papers to their successors, and corporations to admit members to their privileges, to restore a member irregularly disfranchised, and to allow directors, and in proper cases other corporators, to have inspection of books. It is a common process to compel the performance of public duties by public officers, but in such cases the attorney general or other public prosecuting officer should be relator, and a private citizen would not be allowed to take action except where some special and peculiar right of his own was involved in the performance of the public duty. The action of one of his peculiar duties, however, in the performance of his peculiar duties, is not to be controlled by this writ.

MANDANS, an Indian tribe of the Dakota family, dwelling on the Upper Missouri. According to their traditions, they came from under the earth, where they lived near a subterranean lake. They ascended by means of a grape vine, which a heavy woman broke, so that part of the tribe were left below. About 1772 they are said to have resided 1,500 m. from the mouth of the Missouri, in nine villages, en-circled with earth walls, two on the east and seven west of the river. The Sioux soon after drove the eastern villages to the Rickaree or Arikaree country, further up the river, and they emigrated again before those on the west followed them. Lewis and Clarke found them 1,600 m. up the river, in two villages, one on each side of the river, and as they were friendly built Fort Mandan near them. By the advice of the explorers they made peace with most of the neighboring tribes. In 1822 they were estimated at 1,280 in number, and though some placed the population much higher, it did not probably exceed 2,500. They made a treaty with Gen. Atkinson and the agent O'Fallon, July 30, 1825, recognizing the authority of the United States, and making peace. They continued to live severely by their wars with the Sioux, who to this day pursue them with unrelenting hatred, parties under White Bon-net having twice attempted to destroy their village in 1870. In 1882 they dwelt at Fort Clarke, near the mouth of Knife river, and were supposed to number 2,000. In 1897 the smallpox broke out among them, and reduced the tribe to 145 souls in all, chiefly women and children. The survivors took refuge with the Rickarees. They are often spoken of as having been entirely swept away; but they gradually regained numbers, and always maintained a distinct tribal organization. In 1846 they removed to their present abode. In 1850 they numbered 50 lodges and 150 souls, and in 1852 had increased to 385. They are now (1874) with the Rickarees and Minnetarees at Fort Berthold, Dakota territory, on the left bank of the Missouri, in lat. 47° 34' N., lon. 101° 50' W. An executive order of April 12, 1870, set apart a reservation of 8,640,000 acres for the three tribes, in northwestern Dakota and eastern Montana, extending to the Yellowstone and Powder rivers. Under a treaty made July 27, 1866, the government appropriates $75,000 a year for the three tribes. The Mandans were reported in 1873 as numbering 479. Though always friendly, living in a permanent village, they have had no mission-
aries and very feeble attempts at a school. The Mandans live partly by agriculture, having 100 acres in corn and potatoes, and possessing 150 horses, but they have no cattle or proper implements. They extend their hunts west to the Rocky mountains, north to the British line, and south to the Black hills.—The Mandans are of lighter complexion than many of the tribes, and gray hair, even in young persons, is common. This, and a story based on very vague hearsay, that Welsh soldiers at Fort Chartres conversed in their language with the Mandans, has led to many attempts to trace their origin to Madoc’s supposed Welsh colony. Their houses are of wood; some of them are polygonal in shape, with an excavated cellar in the centre. The wooden frame is covered with earth, and the roof is a favorite resort. Quadrangular log cabins are also used. Besides pipes, arrows, bows, &c., they make matting of wild rushes, baskets of willow bark woven in different and intricate colored patterns, large beads, and a very substantial black pottery; some of the vessels hold three gallons and are capable of standing great heat. Their canoes are made of skins. They place the dead, wrapped in skins, on scaffolds, and when these fall they gather the skulls and place them in circles. They have a strange annual religious ceremony, relating to the great canoe and Numinomuckanah, the first or only man. They have many peculiar dances and a fearful cruel initiation rite for young warriors.

**Mandate**, a law term derived from the Roman civil law. It may be defined as a bailment (delivery) of a chattel or chattels to a person who is to do something with or about the things bailed, entirely without compensation. The essential element of the contract lies in the fact that there is not paid or promised, in law or in fact, any compensation whatever for the service to be rendered. The person delivering the chattels is called a mandator; and the person receiving them and undertaking the service called a mandatary. As it must be a service or an act, the whole benefit of which rests with the mandator, this, by the ordinary principles of bailment, determines the amount of care to which the mandatory is bound, and the degree of negligence for which he is answerable. For negligence in a bailee has in law three degrees: slight negligence, which makes the bailee responsible where the bailment was wholly for his benefit; ordinary negligence, for which he is responsible if the bailment be for the benefit of both parties; and gross negligence, for which only the bailee is responsible where the contract is for the exclusive benefit of the bailor. And as it is not a mandate if the bailee derives any benefit whatever from the service, it follows that a mandatory is responsible for loss of or for injury to the thing delivered to him, only when it is caused by his gross negligence.—There is no especial form for the contract of mandate; it may be in writing or by word only, and made very solemnly or in the simplest way; in either case the law is the same. The mandator may recall the thing delivered at any time, and so rescind the contract. But if the nature of the contract be such that a mandatory has rendered the service in part, and will himself suffer detriment if it be not completed, the mandator cannot now rescind it without providing adequate indemnity to the mandatory. When the contract is lawfully dissolved, the chattel must be restored to the mandator; but if indemnity be due to the mandatory, he would have a lien on the chattel to secure it. So, too, the contract would be dissolved by the death of the mandator or of the mandatory, or by any change in the state of the parties which from its nature should recall it, as by insolvency of either party, or insanity, or the marriage of a woman, or the sale of the property, or the determination of a guardianship on which the mandate rested. But in all these cases there must be the same exception as to a service partially rendered. So, too, it is believed that the mandatory may at his own pleasure terminate the contract; and as he may do this at any time, he may do it before he has begun to perform the service at all. But this very question has been more frequently and more elaborately discussed than any or all others which have arisen out of the contract of mandate.—Banks and bankers are so far mandatories, that they receive notes for collection, and render, or engage to render, by agreement or by mercantile usage, these and similar services without any especial or specific compensation. But it is understood that they do this as a part of their business, and for the general and indirect benefit they derive from doing it; and this is undoubtedly consideration enough to make them liable for any injury to their customer caused by their negligence; and it is sufficient to make them liable that their negligence was ordinary, or consisted in the want of common care.—We have seen that a mandatory is, by law, liable only for gross negligence. But it is a voluntary contract, and the parties may vary it in any way, and make it more or less stringent, at their pleasure. Where the parties enter into no specific stipulations, there the law sometimes varies their liabilities in accordance with the particular circumstances of the case. Thus, it is an obvious principle that the mandator has no right to require any more skill or care than he has reason to expect. If an owner of a valuable chronometer carry it for repair to an ordinary watchmaker who does no business of this kind, and the instrument be injured in his hand because no more care and no better skill were applied to it than would suffice for ordinary watches, the owner has no one to blame but himself; unless he can show that the watchmaker especially undertook to be able to do the work required, and that the bailor had no means of knowing his incompetency. On the other hand, if the owner intrusted his instrument to a person who was
known to deal with those of like kind, who
professed this as his business, and expressly or
by implication asserted himself to possess suf-
ficient skill, this person would then be liable,
as for gross negligence, if he did not possess
the requisite skill, or did possess it but did
not make use of it, although he was strictly
a mandatary, and had undertaken the work
 gratuitously. Here, however, a distinction
must be taken. If a workman who is paid for
his service asserts himself to have sufficient
skill, he is liable for injury resulting from the
want of that skill, although he does his best.
But if he is not paid for his service and makes
the same assertion, he is now not liable merely
for the want of it unless he made the assertion
fraudulently and knowing its falsehood; but,
however honest, he is liable if, besides a want
of skill, he has been guilty of negligence.—Man-
dates in the civil law were the orders of the
high functionaries, as the consuls and procen-
suls, and afterward the emperors, to subordi-
nate officers, to instruct them as to the con-
duct they should pursue, either in general or
in particular cases. At common law, the word
mandate in a corresponding sense can hardly
be said to be known. But it is sometimes
used to signify an official command issued by
a court, or a magistrate, or any tribunal hav-
ing authority, in the form of a writ or pre-
cept. It is generally, if not always, confined to
commands issued to an inferior court, to con-
firm or set aside a judgment, as by the supreme
court of the United States to a circuit court,
or to a proper officer, to enforce or execute a
judgment, decree, or order. When the com-
mand is issued to an individual who is a party
before the tribunal, it is commonly known as
an injunction, prohibition, or the like.

Mandelay, Mandalay, or Pattawapura, the
present capital of the kingdom of Burmah, a
little N. of the former capital Amarapura, 8
m. from the Irrawaddy river, and 350 m. N. of
Rangoon; pop. about 90,000. In 1856 its site

Mandelay.

was occupied by cultivated fields; but after
the royal determination to select a new capi-
tal, its erection was carried forward so rapidly
that by July, 1857, it was ready for the recep-
tion of the court. The city is laid out in three
parallelograms, one within another, of which
only the two inner are walled. Within the
inmost is the palace, which is also defended by
high palisades, and surrounded by courtyards,
gardens, and pools. Within this square are
also the various offices of government. The sec-
ond enclosure contains the houses of the civil
and military officers and the soldiers' quarters,
and is laid out in wide streets crossing at right
angles. It is surrounded by a high wall flanked
with strong towers, with four massive gates,
which are locked at night. There is also a
deep ditch. A wide interval separates this
quarter from the outer city, which is occupied
by the merchants, mechanics, &c. The fortifi-
cations are massive, and the palace, pagodas,
and cloisters are brilliant with color and gold;
but the city still resembles the encampment of
a tribe of nomads, and many of the dwellings
are little more permanent than tents. Water
is obtained from the river by a canal, which to
obtain a proper level has to be carried a distance of 16 m. Postal communication with
Rangoon is kept up by dak boats, which make
the voyage in eight days.

MANDEVILLE, Sir John, an English author,
born in St. Albans about 1300, died in Liège,
Nov. 17, 1372. He was a proficient in theolo-
gy, natural philosophy, and medicine, and even
practised as a physician for some time. In 1228 he proceeded to the East, visited the holy places in Palestine, being favored by the sultan of Egypt, and travelled in Armenia, Persia, India, Tartary, and northern China (Cathay). He returned to England about 1235, and wrote a narrative of his travels and adventures, first in Latin, and afterward in French and in English, which he dedicated to Edward III. This work is a singular mixture of fact and fable, a monument at once of the author’s candor and credulity. The earliest edition of it is that of Wynkin de Worde (Westminster, 1499), and the best of the old English editions is that of 1725. A new edition was published by J. O. Halliwell (London, 1839).

MANDINGO, a country in W. Africa, bounded N. by Kaarta, E. by Bambarra, S. by the Kong mountains, and W. by Senegambia, lying between lat. 8° and 15° N., and lon. 8° and 12° W. Much of this region is a high table land, and contains the sources of the Senegal and the Niger. Iron is abundant in the mountains, and gold dust is found in the rivers. The country is divided into a number of small states, each of which is nearly independent of the others. The most considerable of these states are Bambook and Kankan. The Mandingos are remarkable for their industry and energy. They are mostly Mohammedans. The principal trade of that part of W. Africa which lies between the equator and the great desert is in their hands. They are shrewd merchants, industrious agriculturists, and breeders of cattle, sheep, and goats. They are black in color, tall and well shaped, with regular features and woolly hair. They have been called the Hindoos of Africa. They are amiable and hospitable, imaginative, credulous, truthful, and fond of music, dancing, and poetry. They are adventurous travelers, extending their commercial journeys as far as the Guinea coast. They are traders chief ly in gold dust, ivory, and slaves. Polygamy is practised, and each wife has a separate hut. Their language is the richest of the negro tongues, is widely spread, and is written in Arabic characters. The Mandingos are the most numerous race of W. Africa, and have spread themselves to a great distance from their original seat, being found all over the valleys of the Gambia, Senegal, and Niger.

MANDRAGORA. See MANDRAKE.

MANDRAKE (mandragora officinarum), a stemless plant, with lanceolate leaves, concealing beneath them several pale violet-colored flowers, and having a large, forked, fleshy, perennial root. It grows spontaneously in the south of Europe. The plant belongs to the natural order solanaceae, which comprises many poisonous species. Its large root is often divided into two or three forks, causing it to be likened to the shape of the human body, a circumstance which in old time gave it the reputation of being endowed with animal feelings; and there are fabulous stories of its uttering shrieks when torn from the earth. The works of the early herbalists have curious accounts of the supposed virtues of this plant, of which they distinguished male and female varieties. According to Josephus, the collecting of mandrake was no easy matter; after the earth had been well dug from around the root a dog was tied to it, and when the animal tried to follow its master, its struggles pulled up the root; the dog died immediately, a fate which would have befallen the man had he pulled it. Sibthorp (Flora Graeca, London, 1806-'40) says that the young Greeks wear small pieces of the root about them to serve as love charms; and among the ancients it was held in high repute for philters. The qualities of the mandrake are aero-narcotic, purgative, and aphrodisiac. According to Lindley, Dr. T. H. Silvester has shown that the root was formerly used in the same way as chloroform and other anesthetic agents now are. The mandrake of the Old Testament (Gen. xxx. and Canticles vii.) was thought, according to some commentators, to have the power of removing barrenness.—The American mandrake, also called May apple, is podophyllum peltatum, a plant belonging to a very different family, and now largely employed in medicine. (See Podophyllum.)

MANDRILL. See BABAON.

MANES. See MANICHEANS.

MANES, in Roman mythology, the souls of the departed, who were generally recognized as gods and propitiated by sacrifices at certain seasons called feriae denicales, and more particularly at an annual festival kept on Feb. 19 under the name of feralia or parentalia, when each person made offerings to the souls of his deceased parents and benefactors. The manes were believed to have power only by night.

MANETHO, an Egyptian historian, who flourished in the reign of Ptolemy Soter, at the beginning of the 3d century B. C. He was a priest of Sebennytus in Lower Egypt, and wrote in Greek a work on the religion and an
Other on the history of his country, the title of the former being Τον Φύσικον Ευρήμαθη, and of the latter Αιγυπτιατικά. Both books are lost, but numerous fragments have been preserved by Josephus, Juliius Africanus, Eusebius, and by Syncellus, who compiled from the two latter. The list of the Egyptian dynasties, as preserved in the Armenian version of Eusebius, is the most valuable remnant of Manetho's history, the dates of which appear to have been derived from genuine documents, including the sacred books of the Egyptian priests. Attacked as a fabulist by various critics, Manetho has found zealous defenders among the most distinguished Egyptologists, and the recent discoveries in hieroglyphic archeology have vindicated his authority (see Eovr, vol. vi., pp. 458—9); but parts of this fragments are now generally acknowledged to be spurious, as is the astrological poem Αιστελευματικά, which bears his name, but is of late date.—The best critical editions of the fragments of Manetho are by Fruin (Leiden, 1847) and Müller, in vol. ii. of the Fragmenta Historicorum Graecorum (Paris, 1848).

MANFRED, prince of Tarentum, king of the Two Sicilies, natural son of the emperor Frederick II. and of Blanche, a daughter of Count Lanzio of Lombardy, born in Sicily about 1253, fell in the battle of Benevento, Feb. 26, 1266. At his father's death in 1250 he was appointed regent in Italy during the absence of his half brother Conrad IV., the legitimate heir. Pope Innocent IV. immediately excommunicated him, declaring that the house of Swabia had ceased to rule over Sicily, because Frederick II. had died under the papal ban. Insurrections were excited in Capua, Naples, and other cities, but Manfred reduced most of the rebels, advanced to meet Conrad at Pescara, delivered the government into his hands, and aided him in completely suppressing the revolt. He was, however, removed from any part in the administration, his principality of Tarentum was taxed, and the Lanzias were exiled from it. Conrad died in 1254, leaving the crown to his infant son Conradin, and Manfred was again called to the regency. Innocent IV. renewed his opposition to him, supported by the Guelph party in the Two Sicilies, forced him to agree to hold his possessions as an immediate fief of the holy see, and had demanded from him an oath of eunuchism, which when he made his escape to the Saracens at Lucera. Aided by them, he defeated the papal troops at Foggia, recovered Apulia, and after the death of Innocent was recognized king of the Two Sicilies, and crowned at Palermo, Aug. 11, 1258, a report of Conradin's death in Germany being at that time spread through Italy. This report was immediately contradicted by envoys, but Manfred refused to resign the crown, and his bravery, handsome person, accomplishments, and success made the people willingly submit to his rule. Regarded as the hereditary protector of the Ghibellines, he sent troops to Tuscany, by whom the Guelphs were defeated at Monte-aperto. His court abounded with poets and artists, and he himself was noted for poetical skill. He was excommunicated by Pope Alexander IV., who, however, proclaimed a crusade against him, and again by Urban IV., who offered his kingdom for sale to any European prince who had the strength to take it. Charles of Anjou, brother of Louis IX. of France, received the investiture of the Sicilian kingdom, was solemnly crowned by Pope Clement IV. at Rome, Jan. 6, 1266, and marched thence for the conquest of his realms. He was met by Manfred beneath the walls of Benevento. The latter was bravely supported by the Saracens, but the Apulians refused to advance against the enemy, the Sicilian army was thrown into disorder, and Manfred fell covered with wounds in the thickest of the battle. Dante alludes to his death and to his interment without religious rites (Furgatoria, canto iii.). He was twice married, first to Beatrice of Savoy, and next to Helena, a Greek princess, and left three sons and one daughter, who became the prisoners of the victor.

MANFREDONIA, a seaport of Italy, in the province and 22 m. N. E. of the city of Foggia; pop. about 7,500. It is situated at the foot of Mt. Gargano, and surrounded by walls, and the harbor is protected by a strong castle. It is well built, is the seat of an archbishop, and has a Gothic cathedral, containing one of the largest bells in Italy, which stands in the old town (originally Sipontum), about 1 m. S. W. of the new. Salt is obtained from lagoons S. of the town, and there is a considerable export trade in that article, as well as in corn and oranges. The harbor is only accessible to small vessels. Manfredonia was founded about the middle of the 13th century by King Manfred. It was nearly destroyed by the Turks in 1620.

MANGANESE, a metal having the symbol Mn and the atomic weight 54.4. Its mineral is pyrolusite, a compound of the mineral pyromusite, used to neutralize the green color of glass. The ores containing it were variously styled female magnets, magnesia nigra in contradistinction to magnesia alba, alabandine from the city of Alabanda, magnes-denum by the glass makers, and subsequently by different chemists manganesium, manganum, and finally manganese. In 1774 Scheele, and Bergman described the black oxide as a peculiar earth, and Gahn afterward succeeded in isolating the metal from it by mixing the pulverized mineral with charcoal and oil, forming the mass into pellets, which were introduced into a brasqueled crucible and exposed for a long time to the highest heat of a forge. The metal obtained in this way is very brittle, and, like cast iron, contains silicon and carbon, and has a variable specific gravity. Brunner adopted a method analogous to the one employed in the preparation of aluminum; the chloride of manganese was fused with an equal weight of flour spar and one fifth its weight of metallic sodium. The metal thus prepared is very hard and brittle, will take a fine polish, cannot be scratched by a file,
MANGANESE

Nearby nine tenths of the manganese of commerce is consumed in the manufacture of chlorine and bleaching powders; the other tenth is employed in the following industries: to color and decolorize glass; in the manufacture of iron and steel; in the painting and glazing of porcelain and pottery; in the production of oxygen; and in the preparation of the various salts required in medicine and the arts. — Manganese enters as a base into two classes of compounds, the manganous and manganic; and also as an acid into two classes of salts, the manganates and permanganates. There are five well characterized oxides. 1. Manganous oxide, or manganese monoxide, MnO, is a basic body furnishing a series of manganous salts, pink-colored, which rapidly absorb oxygen, and pass into a higher state of oxidation. The pure oxide is a greenish powder obtained by heating the carbonate in absence of air; the hydrate is precipitated as a white gelatinous mass, when an alkali is added to a solution of a manganous salt. Of the manganous salts the chief soluble ones are the sulphate, MnSO₄·4H₂O, and the chloride, MnCl₂·4H₂O. The sulphide, MnS, and the carbonate, MnCO₃, are insoluble. 2. Manganic oxide, or manganese sesquioxide, Mn₂O₃, exists in nature as braunite, and may be prepared artificially by exposing manganous oxide to a red heat. It forms a series of insoluble salts, of which manganese alum is one of the most interesting. 3. Red or manganese-manganic oxide, Mn₃O₄, is a neutral body, corresponding to the magnetic oxide of iron, and occurring in nature as hausmannite. 4. Black oxide or manganese dioxide, MnO₂, is the chief ore of commerce, the magna nigra of the ancients, and termed pyrolusite by modern mineralogists. It can be artificially formed by adding a solution of bleaching powder to a manganous salt. This compound yields one third of its oxygen when heated to redness, and one half its oxygen when heated with sulphuric acid. According to Görgen, MnO₂ is capable of forming manganese salts with alkaline bases. 5. Permanganic acid, H₂MnO₄, is a dark green heavy liquid, obtained by the action of strong cold sulphuric acid upon potassium permanganate. Manganic trioxide, its corresponding hydrate, manganic acid, and the anhydride of permanganic acid, are not known in a free state. The salts of the permanganates, notably the potassium permanganate, are now largely employed as disinfectants, for bleaching, and in the laboratory for the purpose of volumetric analysis. Among numerous methods for the preparation of potassium permanganates, the following may be recommended: 500 lbs. of freshly prepared potash lye of 45° B. are mixed with 105 lbs of pure potassium chlorate, and concentrated by evaporation in an iron kettle; and then, under constant stirring, 182 lbs. of finely pulverized black oxide of manganese are added, and the heat continued until the whole is fluid; it is then stirred until cold; the granular mass is again heated to redness in small
MANGANSE
iron kettles until it is wholly fused, and is then, after cooling, broken up, boiled with water in a large pot, and allowed to settle; the clear liquor is decanted and evaporated to crystallization. In this way, from 180 lbs. of oxide of manganese, 98 to 100 lbs. of potassium permanganate, in beautiful long needles, can be obtained. For the bleaching of engravings and paper stock, for the purification of drinking water, as a disinfectant in hospitals, as a deodorizer of tainted meat in culinary operations, as a tooth wash under the name of Condy’s liquid, for the evolution of ozone oxygen, and for chemical analysis, there are a few agents more valuable than potassium permanganates. Various colors or dyes are prepared from salts of manganese. Nuremberg violet is made by fusing finely powdered pyrolusite and phosphoric acid in proper proportions, digesting in ammonia, filtering, evaporating to dryness, and treating with water, when a yellow powder remains. Barium manganese affords a fine green pigment, much safer than arsenic colors. Potassium permanganate dyes wood in imitation of mahogany and nut wood. The employment of manganese in glass manufacture was one of the earliest uses of this element. The oxide of manganese is put into the glass mixture to counteract the effect of oxides of iron; but in course of time it is itself oxidized by the light and air, and colors the glass red. As red glass intercepts the chemical rays of light, the skylights of photographers and the shades of greenhouses have to be provided with glass to which no manganese has been added. The manufacture of oxygen on a commercial scale, according to the process of Tessié du Motay, is founded upon the property of the black oxide of manganese, when fused with caustic soda, to take up oxygen from current of hot air, which it yields up again to superheated steam, thus offering a cheap and continuous process. As the principal application of the oxides of manganese is in the manufacture of bleaching powders, their commercial value depends upon the amount of oxygen they can furnish, or, which comes to the same thing, the quantity of chlorine which they are capable of eliminating when treated with hydrochloric acid. The methods of assaying the oxides of manganese may be classified under four heads: 1. The determination of the amount of oxygen disengaged by sulphuric acid; 2. the oxidation of oxalic acid; 3. the evolution of chlorine from hydrochloric acid; 4. volumetric estimation. For the details of these methods the reader is referred to Fresenius’s “Chemical Analysis.” The chloride of manganese, obtained by crystallization from the residues in the manufacture of chloride of manganese from the dioxide and hydrochloric acid, is regenerated so as to recover the dioxide to be employed again, by neutralizing its solution with excess of manganese and treating with hydrochloric acid; by slightly elevating the temperature chlorine is disengaged, and the hydrate of the dioxide is precipitated in great purity, thus accomplishing a great saving in the quantity of hydrochloric acid and manganese required in this important industry. Several salts of manganese have been used in medicine, the most important of which are the dioxide, iodide, sulphate, and phosphate, and permanganate of potassium. The first of these is said, when slowly introduced into the system, as happens to those engaged in grinding the mineral, to act as a poison, finally inducing paraplegia; but this by no means a common occurrence. It has been used as a tonic, and also as a local remedy in dyspepsia. The iodide, sulphate, and phosphate are used together with or instead of the corresponding salts of iron, and are supposed to have a similar action. Minute quantities of manganese have been found in the body, but it is extremely doubtful whether its presence is of physiological importance, or is in fact anything more than an accident. Although the therapeutic value of these compounds may be doubted on theoretical grounds, yet practically they have been occasionally found of service. Cases of anemia that have proved rebellions to chalybeate will sometimes respond to the salts of manganese. In chronic nervous debility also these salts sometimes act favorably as a tonic to the nervous system in some unexplained way. The dose of the sulphate of manganese is from 5 to 10 grains. The sirup of the iodide is one of the best preparations of manganese for medicinal use; its dose is from 10 to 20 drops three times a day, and should be given in water soon after eating.

MANGEL WURZEL. See Beet.

MANGLES, James, a British traveller, born about 1785, died about 1861. He entered the navy in March, 1800, took part in the expedition of Good Hope, and became a commander in 1815. In 1816 he visited the Levant, went up the Nile, and joined Belzoni in clearing away the sand from the entrance to the great temple of Isumbul. They then crossed the desert to Syria and the Dead sea, whence in 1820 they returned to England. In 1823 they printed for private circulation a selection from the letters written by them while absent, republished in 1844 under the title of “Travels in Egypt and Nubia, Syria, and the Holy Land.”

MANGOISE, or Mangous. See Ichneumon.

Mango, the native name of an East Indian fruit, of species of Mangifera, of which 14 are known; some of them have been cultivated and become completely naturalized in the West Indies and other tropical countries. The genus belongs to the anacardiaceae or cashew family, of which our native representatives are the sumachs. The most important species is M. indica, of which there are numerous varieties; it is a large spreading tree, with simple, entire, leathery, lanceolate leaves, and large terminal panicles of flowers; the calyx is four- or five-parted, petals six; the stamens four or five, only one or two of which are fertile; ovary
MANGROVE

one-celled, with a curved style; the fruit is large, 3 in. or more long, ovate, and very variable in shape and color; it is at first green, and then becomes partly or wholly orange-colored; beneath the skin there is in the better varieties a rich delicious pulp, in the centre of which is a large stone, to which the inner portion of the pulp is attached by coarse fibres, something after the manner of a clingstone peach. The largest varieties weigh two pounds, but the fruit is usually not larger than a goose egg. In its fresh state the fruit is much prized by the inhabitants of tropical countries, and it is sometimes offered in a very poor condition in our seaport cities. It is sent from the West Indies in the form of a sweetmeat, but in that state it is simply sweet and flavorless. The green fruit, pickled and highly spiced, is imported into England from the East Indies; an imitation of this pickle, called mangoes, is made of green melons stuffed with aromatics. Some of the varieties are not edible on account of their strong flavor of turpentine, and being very stringy also, one writer compares them to "a mixture of tow and turpentine." The tree is sometimes cultivated under glass as a curiosity. The wood is used together with sandalwood by the Hindoos in burning their dead; the bark possesses astringent properties, and the tree when wounded exudes a gum resin which is also astringent. The natives of India are said to make use of the astringent leaves and leaf stalks of the mango to harden the gums, and they also employ them as remedial agents in other ways. The seeds are said to possess anthelmintic properties, and when boiled are eaten in times of scarcity.

MANGOSTEEN (Malay, mangostana; Garcinia mangostana), a tree growing with an upright stem to the height of 20 ft., and bearing a very beautiful and edible berry, esteemed the most delicious of East Indian fruits. The genus Garcinia, of which there are over 30 species, belongs to the natural order Gutifera, which contains trees that are natives of the hottest parts of the world, and characterized by thick, entire, opposite leaves and resinous juices. Several species of Garcinia furnish a portion of the gamboge of commerce. In the mangosteen the leaves are about 7 or 8 in. long, and about half as much in breadth at the middle, gradually tapering at both ends, of a shining green above, but of an olive color beneath. The flower resembles a single rose, composed of four roundish petals, of a dark red color, which are thick at the base, but thinner toward the margins. The fruit is about the size and shape of an orange, and is crowned by a broad peltate-lobed stigma; the rind is like that of the pomegranate, but softer, thicker, and fuller of juice; it is green at first, but changes to a dark brown with some yellowish spots; the inside is white or of a rose color, and is divided into several cells by thin partitions, in which the seeds are lodged, surrounded by a soft, juicy pulp, of a delicious flavor partaking of the strawberry and the grape; one writer describes its qualities as "utterly inexpressible." It can be eaten in great quantities without any inconvenience, and it is the only fruit which sick people in India are allowed to eat without scruple. It is said that Solander, when in the last stage of a putrid fever at Batavia, found great benefit from sucking this delicious and refreshing fruit. The pulp has a most happy mixture of the tart and the sweet, and is no less salutary than pleasant. The dried bark of the Garcinia is astringent, and has been used in dysentery and in infusion as a gargle for sore mouth; the Chinese employ it for dyeing black. The several species are beautiful stove plants.

MANGOSTEEN (Garcinia mangostana).
of the aerial roots borne by the plants; the genus gives its name to the small family of *Rhizophoraceae*, which is nearly related to the myrtle family. There are but few species, the best known of which is *R. Mangle*, a plant common in tropical countries; its northern limits upon this continent are southern Florida on the Atlantic and Lower California on the Pacific coast. It is a tree sometimes 40 ft. high, but usually much smaller, with opposite, entire, leathery leaves, and axillary, few-flowered clusters of showy flowers; the persistent calyx has an obovate tube and a four-lobed limb; the yellow petals are four, thick, notched at the apex, and woolly on the margins; stamens eight; ovary two-celled with two ovules in each cell; fruit one-celled, indehiscent, at length perforated by the radicle of the embryo, which germinates while the fruit is still upon the tree. The mangrove is found in muddy localities directly upon the seashore, where it forms impenetrable thickets; its manner of growth is like that of the banian tree in miniature, as the stem and branches produce long slender roots, which finally reach the earth and become fixed. The mangrove not only prevents the encroachments of the sea upon the land, but acts an aggregative part in wresting land from the sea; the seeds, which might be washed away if they fell as soon as ripe, germinate while yet attached to the stem, and when one falls it is already provided with a long radicle; in fact they are not properly any longer seeds, but young plants, which when they drop into the mud are ready to grow at once; after the young tree has formed a stem and head of branches, it is then by means of its aerial roots enabled to spread and occupy more territory, and thus advance seaward, while its fruit will drop beyond the line of the parent tree and new plants be produced further from dry land. The tangled mass of stems and roots in a mangrove thicket retains the débris from the land that may be brought down by floods, and thus upon the land side of the grove solid ground is gradually formed. From the great quantity of decaying vegetable matter collected in a mangrove thicket, such localities are highly malarious. The account of oysters growing upon trees is not, as has been supposed, a traveller's fable, for the submerged portions of the branch-like roots of the mangrove are often studded with these and other mollusks, and when the tide recedes oysters may be literally gathered from trees. Other species are found on the Malabar coast, and one is found on the Feejee and neighboring islands. The wood of the mangroves is tough, hard, and durable in the water; hence it is employed for boat building, a use for which the natural curves of its branches and its numerous knees especially adapt it. The bark contains a large amount of tannin, and is used all over the West Indies in the preparation of leather, as well as by dyers, giving with different mordants slate-colored and various brown tints. Occasional shipments of the bark have been made to England, but as there are many products which are much richer in tannin in proportion to their bulk, it is not likely to become of much value. The fruit of the common mangrove is ovate and crowned with the persistent calyx, and said to be sweet and edible; its fermented juice makes a kind of light wine.

**MANHATTAN ISLAND.** See NEW YORK.

**MANHEIM.** See MANNHEIM.

**MANICHÆANS**, a religious sect of the East, founded about the middle of the 3d century. Its origin is involved in obscurity, oriental and occidental writers differing much in their accounts of it. According to the latter, Manes or Mani, the founder of the sect, was not the originator of his doctrines. The fullest account of his life and of the source of his system is given by Epiphanius, and is in all essentials corroborated by Cyril, Socrates, Theodoret, Suidas, Cedrenus, and the *Acta Disputationis S. Archelai* from which their statements were derived. This work, of uncertain authorship, and extant only in a corrupted form, is rejected by some scholars as wholly unhistorical. It contains an account of a disputation between Manes and Archelaus, bishop of Cæsar. It states substantially that a certain Seythianus, an Arabian by birth, but a native of Seythia,
a man of much learning, wealth, and travel, conceived the idea of a dualism, the doctrine of good and bad principles. His disciple Terebinthus composed for him four books, entitled 

Mystripia, Kepelapia, Eiagyleon, and Oeyapio. Scythianus was intending to go to Judea, in the time of the apostles, and teach his doctrines there (as he did, according to Epiphanius), when he suddenly died. Terebinthus fled to Persia, took the name of Buddha, and taught the doctrine of Scythianus. Seeing that he was not gaining disciples, he attempted to deceive by magic arts, and while in the act fell from a roof and died. The books of Scythianus became the property of an old woman in whose house he had been lodging, and whose slave, Cubricus, called also Manes, inherited them at her death. Manes studied the doctrine and undertook to teach it, but with little success. Attempting to cure a sick child of the king of Persia with some of the remedies given in his books, and failing, he was thrown into prison. Shortly before this occurrence Manes had sent his disciples Thomas, Hermes, and Addas or Adda to Jerusalem to study the Christian religion. Upon their return they gave him the Christian books which they had bought, and he studied them in his prison, and embodied many Christian doctrines, changed and falsified, in his own system. Shortly after he succeeded in making his escape. He challenged Marcellus, a pious Christian of Cascar (Kaskar) in Babylonia, to a religious disputations, and was defeated. He then went to a place designated as Diodori Vicus, where he disputed with the bishop Archelaus and the presbyter Trypton, and was again discomfited. He was finally taken prisoner and sent back to Persia, where he was flayed alive, and his skin, stuffed with straw, was publicly exhibited as a warning. Several reasons, as pointed out by Baur (Das Manichäische Religionsystem, 1851), tend to show that the statements made by Epiphanius's narrative are far from being all historical. The Fibrit el-ulum ("List of Sciences"), the oldest known literary history of the Arabs, written about 987 by Abu'lfaraj Mohammed ben Ishak en-Nedin, a book which still made use of the works of Manes and his disciples, no longer extant, has statements in regard to Manes which are at variance with those of Epiphanius. According to this, Manes was born in Ctesiphon, the son of Futtak Bavek or Fatek, of Hamadan, and of a woman probably of Babylonian origin. When 13 years old Manes became the subject of a divine inspiration, and at the age of 24 he was asked to act as a prophet. De Sacy, in his Mémoires sur diverses antiquités de la Perse, adduces several oriental books which state that Manes, after hiding himself in a cave for a year, pretended to have come from heaven, where he had received a painted slate, thereafter known as the Ertenzi-Mani. It is further stated that Manes alleged that he had received his doctrine from the king of paradise through the mediation of an angel. He himself was the Paraclete of whom Christ had spoken. His tenets were derived partly from Christianity and partly from the Magi. His writings were six in number, one in Persian and five in Syriac, besides a multitude of epitaphs. The graphic system employed by himself and his disciples is said to have been peculiar, resembling both Persian and Syrian characters. Most of the oriental writers agree that Manes came to a violent death, and that he was brought before a tribunal of priests, charged with heresy, and condemned. Spiegel, in his Erdrische Alterthumskunde (vol. ii., 1873), is inclined to consider historical the statements that Manes entered the career of a prophet when he was 24 years old, and that he addressed himself both to the Zoroastrians and Christians of Mesopotamia. The Manichaean system is a mixture of Parseeism, Christianity, Babylonian mythology, and Buddhism. It contains a dualism different from that of the Magi, and shows the same easy transition from the concrete to the abstract characteristic of the Iranian religion. It assumes that there are two kingdoms existing from all eternity, those of light and of darkness, coexisting with and bordering on each other; the former under the dominion of God, the latter under the dominion of the demon or Hyle (matter). (See Gnosticism.) An inroad was made by the kingdom of darkness, the barriers were broken through, the primitive man, God's first-born son, was for a time imprisoned, and the materials of light and darkness were intermixed. God now caused the world to be made out of this mixed material. It was made by the "living spirit," in order that the unmixed and imprisoned material of light, which is called by the Latin writers Jesus potibilis, might be separated by degrees, and the old boundaries restored. This recapturing of the material of light was effected by Christ and the Holy Spirit, who inhabit respectively the sun and moon and the air, while the demon and evil spirits are fettered to the stars. Adam, the progenitor of the human race, was created after the image of the primitive man. Every man has two souls, one of light, the other of darkness; and it is his mission to subject the latter to the former, uniting with his soul of light some of the material of light imprisoned in certain plants, and so fitting it for return to the kingdom of light. The demon long led men astray by the false religions of Judaism and heathenism; but at length Christ descended from the sun, assumed a bodily appearance, and taught true worship. He was not fully understood even by his apostles; still less by their successors, whom Manes contemptuously calls Galleans. Hence Christ promised the Paraclete, who appeared in Manes. The Manichaeans therefore rejected wholly the Old Testament, and partially the New. They appealed to apocryphal writings, and especially to the writings of Manes, which alone they acknowledged as authoritative. The spirit of their
morality was self-conquest by asceticism, of which they held to three degrees: 1, what the Latin writers call signaculum oris, abstinence from all impure words, and even thoughts, and from any kind of food which might increase the power of the body over the spirit, and especially flesh, wine, and strong drinks; 2, the signaculum manuum, abstinence from such work as makes this world an attractive home; 3, the signaculum sinus, abstinence from sexual intercourse. Legal external marriage was not absolutely forbidden, but celibacy was strongly recommended, while abstinence from procreation was a moral duty. This rigorous asceticism imposed on the baptized members such privations that most Manichaeans remained catechumens, postponing baptism as long as possible. The worship of the Manichaeans was very simple. Sunday was celebrated by fasting; they kept the day of Manes's death as an annual festival; they administered baptism with oil, and admitted only baptized members to the Lord's supper, which was celebrated in secret. Manes himself sent out 12 apostles, and these were afterward represented by 12 magistri, with a 13th invisible one, without doubt Manes himself, at their head. After them followed 70 or 72 bishops, who in turn had under them presbyters, deacons, and the other eleti, or baptized members of the church. The cruel persecution of Manes, the date of which is commonly fixed at A.D. 276, in the reign of Bahram I., was undoubtedly followed by a persecution of his disciples. The Manichaeans consequently fled from Iranian territory into lands occupied by Tartaric races, where Buddhism was the general religion, and Toleration was shown to other sects. They returned to the west only after the fall of the Sassanian dynasty, and settled especially in Babylonia and its environs, which became the seat of the Manichaeen primate, and seems to have been looked upon as a sort of holy city. Many migrating to Khorasan in the reign of the caliph Muktadir, and still more to Samarcand. Moslem fanaticism did not disturb them there, as the chief of the Turkish tribe of Tagazgaz, who took an interest in them, threatened vengeance against the Mohammedans in his territory if any harm should be done to the Manichaeans. At the time of the author of the Fihrist, in the 10th century, there were but few Manichaeans in the west, and in Baghdad their number diminished, within his own recollection, from 300 to 5. Manes had appointed Sis or Sisininus to be his successor as the head of the church, and the succession was continued for several centuries. But in the time of the caliph Walid I. (705), while Mihr was the head of the Manichaeans, a certain Zadhrumuz separated from the community and built in Madain a temple, of which he declared himself to be the chief. He appointed Miklas to be his successor, and hence those who adhered to him were called Miklasiya, and those who recognized the authority of Mihr were called Mihriya. It seems that the two sects were subsequently reunited. During the caliphate of Al-Mamoun (813-833) Yazdaktes did nothing to cause another asceticism, of which very little is known. The doctrine of Manes succeeded in gaining many converts, as it appealed largely to the imaginative and philosophic character of the oriental mind. Manichaeism spread beyond Iran and Mesopotamia over Asia Minor and Africa, and it found its way into Europe. Its history may be divided into three periods. The first period extends to the end of the 6th century, until which time the Manichaean doctrines continued in a measure in their original oriental form. In Africa its success was sufficiently great to be looked upon as the rival of Christianity. It numbered among its converts many eminent and learned men, as Alexander Lycopolitans, Faustus of Milevi, and even St. Augustine for at least nine years. St. Augustine says that the name of Manes or Mani was changed to Manichaeans, in order to avoid ribald remarks called forth by the resemblance of the former to the Greek μανια. The persecutions of Dioecletian, Constantine, Gratian, Theodosius, Valentinian, and Honorius finally succeeded in weakening their power, and the Vandal kings drove them out of Africa into Sicily and Italy, where Pope Leo I. and his successor, soon took measures either to convert or destroy them. But a century and a half later Gregory I. still complained of the large number of Manichaeans in Christian lands. Persecutions had taught them, however, the wisdom of appearing to adopt some of the Christian rites and doctrines, which had the effect of gradually perverting the oriental faith into a Christian heresy, and thus Manichaeism entered upon a new phase of its existence. The second period reaches from the 7th to the 11th century. Cappadocia and Armenia had been the cradle of strong Manichaean communities, which, finally exiled into Bulgaria, in the 10th century, remained there, and headship of Manes, and rejected various doctrines seemingly unintelligible and unprofitable. Constantinople was not as severe on them as the Roman pontiffs and emperors, though the East finally subjected them to the same persecutions which their brethren had suffered in the West. (See PAULICIANS.) The Manichaeans of Italy soon came under the influence of the Bulgarian reform, and a new variety of the original doctrine sprung up in the West. This third development embraces the 11th, 12th, and 13th centuries. Germany, France, and Italy proceeded against heretics with unwavering severity, and even the populace joined in a general persecution of them, surrendering them to the penalty of death. (For the history of these new sects, see ALBIGENSES, and CATHARISTS.) In modern times the various forms of Manicheism have gradually disappeared, and to all appearance, perhaps with the exception of a few in Bulgaria and Persia, disciples of Manes are nowhere to
be found. In theological polemics the term Manichean is still applied to doctrines representing evil as a substance, identifying it with matter, or regarding the body of man as the source or seat of sin. The writings of Manes and his immediate disciples are not extant. Fragments are found quoted in the writings of their opponents, as in the Acta Disputationis Sancti Archelai, Episcopi Mesopotamensis, cum Manete; St. Augustine, Contra Faustum Manichaum, and Contra Fortunatum Manichaum; and St. Epiphanius. Besides the accounts of Manicheism found in works on ecclesiastical history, and the special works mentioned above, see Schmidt, Histoire et doctrine de la secte des Cathares ou Albigeois (2d ed., Paris, 1849), and Flügel, Idem, seine Lehre und seine Schriften, ein Beitrag zur Geschichte des Manichäismus, aus dem Fihrist, in Text nebst Übersetzung (Leipsic, 1862).

MANIKIN. See ANATOMICAL PREPARATIONS.

MANILA, a city, capital of the island of Luzon, and of the whole Philippine archipelago, near the mouth of the Rio Pasig, which empties into the bay of Manila; lat. 14° 36' N., lon. 121° E.; pop. (including the suburbs) from 140,000 to 150,000, of whom the Spaniards and creoles are about one tenth, the remainder being native Tagalas, mestizos, and Chinese. Most of the Chinese are engaged in commerce, and but few in agriculture. The city is divided by the river into two sections, Manila proper and Binondo. The former, which is the military town, is surrounded by lofty walls, and communicates with Binondo by a fine stone bridge 511 ft. long, with 10 arches, first built in 1630, but rebuilt in 1814. The situation of the town is beautiful. On one side is the bay, in a framework of forest-clad mountains declining gradually toward the shore; and on another a picturesque plain, where are the military parade ground and the fashionable promenades, crowded in the evening with showy equipages and gay equestrians and pedestrians. The aspect of Manila proper is somewhat dull and monotonous. The streets are perfectly straight, macadamized, and provided with ample granite sidewalks. The houses, which have in general a sort of pala- tial appearance, are of two stories, and built in a manner to resist the hurricanes and earthquakes so frequent here. The upper story, commonly occupied by the family, is encircled by a spacious gallery, from which the sun is excluded by large sliding panels with mother-of-pearl panes, sufficiently transparent to admit light to the apartments. In this town are the cathedral and some other churches, with all the monasteries and convents, both of which are numerous; the governor's palace; the citadel, overlooking both towns; the courts of justice, custom house, barracks, arsenal, hospital, and other public buildings. Binondo, on the N. bank of the river, is much larger and more animated; but the streets are less regular and many still unpaved. Numerous canals, crowded with pirogues, gondolas, and other boats, intersect this suburb, in which reside the wealthy merchants, Spanish, English, Indian, Chinese, and mestizos. The newest and most elegant houses on the banks of the Pasig, though of unassuming exterior, are highly adorned within. Each house has a landing
but the anchorage in the port of Manila is excellent for small vessels. Manila is by far the
sole emporium of foreign trade with the Spanish East Indies. The chief articles of export
are sugar, tobacco (exclusively to Great Britain), and in Spain, the latter receiving annually a
state tribute out of the tobacco crop to the amount of $800,000), cigars, hemp, coffee, indigo,
copper, and gums and other tropical products. The imports include cotton, linen, woollen,
and silk fabrics, manufactured iron, wines, beer, &c. The total value of the exports
for the year ending Sept. 30, 1872, was $18,679,770 19; of the imports, $2,557,227 42; the
amount of duties paid on the latter was $284,406 31. The more important commercial
relations are with Spain, Great Britain, the United States, France, Germany, China, Chili,
and the Hawaiian islands. The tobacco manufacture, a government monopoly, employs 20,
000 workers of both sexes. (For other manufactures, see Luzon, and Philippine Islands.)
Educational establishments are numerous in Manila: there are the university of St. Thomas,
with 500 students; that of St. John, with 250; a royal marine school (established in 1829), a
commercial (1840), and a number of primary schools public and private.—Manila was founded
by the Spaniards in 1571, on the site of a Malay town defended by stockades. Miguel Lopez
de Legazpi, conqueror of the Philippines and founder of the city, was indefatigable in
promoting its growth. He founded the cathedral, the metropolitan church of all Catholic
Oceanica, and established a municipal organization, which was confirmed by Philip II. of
Spain, and continues to be the form of municipal government in Manila. Chinese laborers
and traders settled here in large numbers, and in time became very turbulent. In 1603 an
insurrection took place, and 28,000 Chinese were massacred; notwithstanding which, the
Chinese population in 1639 numbered in Manila about 30,000. The severity of imposts
and religious persecution again led to insurrection, which terminated with the slaughter of
about 25,000 Chinese, and the banishment of the remainder; but they soon again resorted
to the city in large numbers, and assisted Admiral Cornish and Sir William Draper in the
capture of it in 1762. The English expedition, composed of 2,500 Europeans and sepoys,
which sailed from Madras, took the city by storm, after a siege of ten days. The governor
and archbishop agreed to pay $5,000,000 to save the rich cargoes then lying in the port;
but the king of Spain refused to ratify the offer. Sir William Draper has been rendered
conspicuous by his controversy with Junius concerning this ransom. Manila was restored
to Spain by the peace of Paris, Feb. 10, 1763. The Japanese had much trade with the city,
and were settled in it in large numbers during a portion of the 17th century, before their
laws excluded them from all communication with the rest of the world. They imported
the raw material extensively used in their manufactures directly from the Philippines.
Earthquakes have been frequent and disastrous; in that of 1645, 3,000 lives were lost;
and those of 1762, 1824, and 1852 were also destructive of life and property; while in that
of June, 1863, about 1,000 persons perished. In March, 1833, about 10,000 huts were burned,
some lives were lost, and about 30,000 people left homeless.

**MANILA, or Manila Hemp**, the fibre of *musa textilis*, a native of the Philippine islands, and
of the same genus with the banana and plan-}

![Manila Hemp Tree (Musa textilis)](image-url)
near the centre are rejected, as their fibres are not strong enough to be useful. To separate the fibre, the petioles are thoroughly beaten with wooden clubs, by which much of the adhering tissue is loosened; and the separation is further effected by the use of a coarse hackle, after which the fibres are frequently washed, and when freed of all extraneous matter they are hung upon poles or ropes to dry. The fibres are coarser or finer as they are from the outer or inner petioles, and they are carefully assorted, the coarsest being for cordage and the finer for weaving. As a material for ropes and other cordage its great tenacity and durability make it highly valuable, and large quantities are used for this purpose. From the finer fibres the inhabitants of the islands weave tissues of great delicacy; the fibres are not spun, but used in their natural state; those of a proper size being selected, the single fibres, which are about 15 ft. long, are tied together at their ends, and wound into a ball, soaked in hot water, and dried, when they are ready for weaving. Tissues woven from the abaca fibre are almost transparent, somewhat rigid, light, and cool to the touch; muslins, veils, napkins, &c., are made from it, and it is even woven into shirts and other articles of apparel; the material readily takes dyes of all colors. Large quantities of paper are made in whole or in part from manila, usually in the form of wound-out rope; it possesses great toughness in proportion to its weight.

M A N I L I U S, Marcus, a Latin poet, of unknown date and history. Bentley supposed that he was an Asiatic, and Huet that he was a Carthaginian, and there are indications in his only known poem, the Astronomica, that it was written under Augustus. The first manuscript was discovered by Poggio in 1416, and was printed at Nuremberg in 1472 or 1473. Other MSS. were afterward found, from which later editions were prepared. There is an Englishmetrical translation by Creech (London, 1697).

M A N I N, Daniele, an Italian statesman, born in Venice, May 18, 1804, died in Paris, Sept. 22, 1837. He studied law at the university of Padua, and commenced practice about 1820. He early became a champion of the national party, though aiming to combat Austria with legal weapons. After the accession of Pius IX. Manin and Tommaso became the leaders of the reform movement in Venice (1847). Manin asked for a separate government of Venice and Lombardy, a revision of the codes, an annual budget, and freedom of religion and of the press. Upon Radetzky's bloody suppression of a riot in Milan (Jan. 9, 1848), his and his colleagues' protests (Jan. 18) resulted only in the imprisonment of the two patriots. The revolution which soon followed forced the Austrian commander, Count Zichy, to surrender, March 22; the republic of Venice or St. Mark was proclaimed, March 23, and Manin and Tommaso were placed at the head of affairs. The Venetians prepared to form an independent republic in confederation with the other Italian states; but the Venetian assembly, convened June 3, agreed to the fusion with Sardinia and Lombardy so as to form a united kingdom of northern Italy under Charles Albert. Manin resigned; but after the king's defeat at Custozza (July 25), the Venetians prepared for a separate defence. The republican banner of St. Mark was again hoisted, Aug. 11, and a triumvirate was appointed to carry on a dictatorial government on the 10th, Manin being its head. After the defeat of Charles Albert's army at Novara, March 28, 1849, the Austrians concentrated their efforts upon the subjugation of Venice, while the French undertook the reduction of Rome. Fort Malaghera, one of the forts outside of Venice, fell into the hands of the Austrians, May 26, and Rome was occupied by the French at the beginning of July. Venice, however, continued its resistance under the military lead of Gen. Pepe, and Manin only capitulated (Aug. 29) upon terms of amnesty to all except 40 conspicuous leaders, including himself, who were compelled to withdraw before the entrance of Radetzky. He spent the rest of his life in exile in Paris, supporting himself by giving lessons in Italian, and occasionally writing for the newspapers of Paris, London, and Turin. After the liberation of Venice his remains were brought from Paris at national expense, and buried with great solemnity (March 22, 1868). An edition of some of his writings was published under the title Documents et pièces authentiques laissées par Daniel Manin (Paris, 1866). See also Daniel Manin, by H. Martin (Paris, 1859), and Errera, La vita ed i tempi di Daniele Manin (Venice, 1872).

M A N I O C, or Mandioca. See CASSAVA.

M A N I S, an edentate animal of Asia and Africa. See PANGOLIN.

M A N I S S A, or Manisa (anc. Magnesia ad Sipyllum), a city of Asia Minor, in the vilayet of Aidin, on the S. bank of the Hermus, and on the N. slope of Mt. Sipyllus, about 20 m. N. E. of the city of Smyrna; pop. estimated from 30,000 to 60,000, chiefly Turks, with nearly 4,000 Greeks and a number of Armenians and Jews. There are numerous mosques, four Roman Catholic and several Greek and Armenian churches, and four synagogues. Among the public buildings are those for the Turkish lieutenant governor and for the Greek bishop, a splendid khan, a district lunatic asylum, the Ottoman bank, the railway station, and the new bazaar. The finest palace is occupied by the Karoosmanglu family, the former princes of Carmania, once omnipotent here, and still large landed proprietors. The principal export is cotton, which has been produced in considerable quantities since the civil war in the United States; and the Smyrna railway, opened in 1865, of which Manissa is the last station before reaching Kassaba, has rendered the cotton trade still more active in the two localities. (See MAGNESEIA.)
MANISTEE

MANISTEE, a N. W. county of the lower peninsula of Michigan, bounded W. by Lake Michigan, and watered by the Manistee river; area, about 550 sq. m.; pop. in 1870, 6,074. The surface is level, the soil fertile, and there are extensive forests of pine. The chief productions in 1870 were 5,517 bushels of wheat, 10,509 of Indian corn, 4,749 of oats, 29,360 of potatoes, 12,730 lbs. of butter, and 565 tons of hay. There were 1 manufactory of engines and boilers, 2 of saw, doors, and blinds, 1 of cigars, and 20 saw mills. Capital, Manistee.

MANISTEE, a city and the county seat of Manistee co., Michigan, on Lake Michigan, at the mouth of Manistee river, 133 m. N. of Lansing; pop. in 1870, 3,943; in 1874, 4,894. It is one of the chief lumber manufacturing points on the lake. The mills, about 20 in number, are situated on Manistee lake, an expansion of the river above the city. There are also an extensive tannery and seven brick mills. Manistee has some fine residences, a good union school, and several churches. It was incorporated in 1869.

MANITOBA, a province of the Dominion of Canada, situated between lat. 49° and 50° 30' N., and lon. 96° and 99° W. It is bounded S. by Minnesota and Dakota, and on all other sides by the Northwest territories, and is 135 m. long E. and W. by 104 m. in breadth, forming nearly a parallelogram; area, 14,340 sq. m. It is divided into four counties, Lisgar, Marquette, Provencher, and Selkirk, which are subdivided into parishes. The capital and chief town is Winnipeg, on the N. bank of the Assiniboine or Assiniboine river, at its confluence with the Red, which has about 3,000 inhabitants, and contains within its limits Fort Garry, the American headquarters of the Hudson Bay company. The population of the territory now embraced within the province in 1823 was about 600; in 1843, 5,143; in 1849, 5,291; in 1856, 6,525; in 1870 (census taken Dec. 24), 11,963, of whom 5,757 were French half-breeds, 4,607 English half-breeds, 1,605 whites, and 553 Indians: in 1874, about 20,000. The half-breeds include all having any intemixture of Indian blood, and are the descendants of Indian mothers and French Canadian, English, or Scotch fathers, the Scotch element predominating over the English. The distinction of French and English in the census is based rather upon language than lineage. Since 1870 a considerable immigration, particularly from Ontario, has set in. The principal settlements are on both banks of Red river, from about 20 m. N. to 15 m. S. of Winnipeg, and along the Assiniboine for about 20 m. W. of that town. N. of the half-breed settlements on Red river is a village of settled and Christian Indians of the Swampy Cree tribe. The westernmost settlement on the Assiniboine is at Prairie Portage (Portage-la-Prairie), 67 m. above Winnipeg. Besides the Indians enumerated there are unenrolled Saulteaux and Maskegons, or Swampies, in the province, and some Sioux who have been driven from Minnesota. The half-breeds are a handsome race, large, strong, and well made; they are generally swarthy, but many exhibit no sign of Indian extraction. Intrepidity and indefatigable travellers, they manifest the Indian instinct in the ability to find their way through forests and across prairies. Many are employed by the Hudson Bay company as boatmen, guides, and sledge drivers; others are farmers; while a large proportion, especially of the French, pay comparatively little attention to agriculture, but pursue the buffalo in summer and winter on the plains W. and S. W. of the province. In general they are intelligent and hospitable, but prodigal of their earnings, fond of pleasure, inclined to drunkenness and indolence, and resolute of restraint. Those engaged in farming, with a settled mode of life, have acquired more stable and provident traits of character than the hunters.—The general surface is a level prairie, 80 ft. above Lake Winnipeg and 700 ft. above the sea. It is broken by the Big ridge and Pembina mountain, ancient beaches of that lake which is supposed at one time to have extended over this region. The Big ridge, rising in places 60 or 70 ft. above the general level, commences near Lake Manitoba, N. of the Assiniboine river, and runs nearly parallel with that stream to the Red river, crossing which below Winnipeg, it continues in a S. E. direction to German creek, and thence a little W. of S. to the Roseau river, which it crosses near the United States boundary and 46 m. above its mouth. The Pembina mountain enters the province near the 98th meridian, and runs N. to the Assiniboine, just below Prairie portage. It marks the ascent from the general level to the hilly and undulating prairie on the south and west, which is about 100 ft. higher. West of Pembina mountain, and a little S. of the Assiniboine river, are the Blue hills, 300 to 400 ft. above the plain. Stony mountain, W. of Red river, and about 15 m. N. of Winnipeg, rises 60 ft. above the surrounding prairie. The valley of Red river through most of its course is marshy; the Assiniboine, about 140 m. above sea level, is navigable by steamers from Manitoba to Minnesota. Red river divides Manitoba into two unequal parts, about a third lying on the E. and two thirds on the W. bank. The chief tributaries from the east, commencing at the
United States boundary and going N., are the Roseau or Redgrass river, Rat river, Oak creek, and la rivière Seine or German creek, which joins the Red just below Winnipeg. On the west the Pembina river drains the S. W. corner of the province, and flowing S. E. joins Red river in Dakota, a little S. of the boundary. Proceeding N., the other western tributaries are the Scratching river, la rivière Sale or Stinking river, the Assiniboine, and Netley creek, which joins the main stream near its mouth. The Assiniboine, the largest tributary, rises in about lat. 52°, W. of Lake Winnipegosis, flows first S. E., then bends E., and continues in this direction for about 150 m. of its course through Manitoba, emptying into Red river about 50 m. above Lake Winnipeg. The only other stream worth mentioning is White Mud river, which flows into Lake Manitoba. —The geological formations occurring in the province are the Silurian in the east, the Devonian in the centre, and the cretaceous in the southwest, W. of Pembina mountain. These series run parallel with each other in a N. N. W. and S. S. E. direction. The Laurentian series occurs only in the N. E. corner. The soil of the greater portion, and particularly of the prairies extending for 30 m. on each side of Red river, consists of a deep alluvial deposit of rich black mould, resting partly on limestone and partly on a bed of hard clay. The limestone crops out on the Red river below Winnipeg, where it is suitable for building material. Stony mountain consists of limestone. The elevated prairie W. of Pembina mountain is covered with a light sandy clay loam, and near Scratching river the soil is light and sandy. Big ridge is composed of gravel, and Pembina mountain consists of clay, gravel, and sand, thickly strewn with granite boulders. Salt springs are found in the valley of la rivière Sale, and at one or two points on Red river further S.; and there are saline deposits near Stony mountain and in the vicinity of Lake Manitoba. —The climate is healthy, but exhibits great extremes of temperature, the thermometer falling in winter to 40° below zero and even lower, and in summer rising as high as 100°. Owing to the dryness of the atmosphere, the cold is not severely felt, and horses winter on the prairies without shelter, fattening on the grasses which they dig from beneath the snow, which is seldom very deep. The rainfall in summer is ample for agricultural purposes, and vegetation comes rapidly to maturity. Winter sets in with the commencement of November, and continues to the middle of April. Frosts are liable to occur until the end of May, and cold nights begin toward the end of August. The mean temperature at Winnipeg of the year ending May 31, 1873, was 33°; of summer, 65°; of autumn, 37°; of winter, -3°; of spring, 52°; warmest month (July), 67°; coldest month (December), -9°. The total precipitation of rain and melted snow was 22-33 inches. The soil is very fertile. Wheat is the staple crop, and yields abundantly, 40 bushels to the acre being commonly raised. Barley, oats, rye, potatoes, turnips, beets, carrots, parsnips, cabbage, lettuce, &c., also do well. Indian corn is not much cultivated, though some varieties come to maturity in the driest soils. Flax and hemp have been successfully grown. The prairie grasses furnish good hay, and afford nutritious pasturage. Considerable numbers of horses, cattle, sheep, and swine are raised. Grasshoppers or locusts are the chief pest of the farmer, and have on several occasions destroyed all vegetation. The principal wild fruits are strawberries, currants, raspberries, plums, cherries, blueberries, whortleberries, and marsh and high-bush cranberries. Wood is scarce, and is found chiefly in narrow strips along the Red and Assiniboine rivers, the timber belt extending from ½ m. to 2 m. back from the stream on either bank. There are also portions of woodland along the other streams. The principal trees are the clu, oak, maple, and poplar; tamarack, spruce, cedar, and birch also occur. The ridges afford small aspens and pines, and clumps of willows and aspens are found in the marshes, as well as on portions of the prairies. The ash-leaved maple (negundo fraxinifolium) yields sugar. Among the wild animals are elk, rabbits, badgers, and squirrels. There are ducks, geese, cranes, swans, snipe, prairie hens, and other birds. The rivers and lakes swim with whitefish, sturgeon, trout, cat fish, pike, perch, and gold-eyes. —There are no returns of the trade with the other provinces of the Dominion. The value of goods entered for consumption from foreign countries for the year ending June 30, 1873, was $1,029,130, of which $509,838 were from Great Britain and $441,559 from the United States. The exports to foreign countries amounted to $246,988, all but $4,915 consisting of furs. The greater part of the exports were to Great Britain, the rest to the United States. There are no railroads in Manitoba, but the projected Canadian Pacific line is to pass through it, and a railroad has been commenced from Winnipeg to the United States boundary, to connect with the Minnesota system. There is telegraphic communication with the United States. —The government is based upon the British North American act (1867) of the imperial parliament, and the Manitoba act (1870) of the Dominion parliament. The executive power is vested in a lieutenant governor, appointed by the governor general of the Dominion in council, and an executive council of six members, appointed by the lieutenant governor, and responsible to the assembly. The legislature consists of the legislative council of seven members, appoint- ed by the lieutenant governor for life, and the legislative assembly of 24 members, elected by districts for a term of four years. The sessions are annual. Every male person 21 years of age and upward, actually resident in the province, being a British subject or having taken
the oath of allegiance, is entitled to vote, upon having his name entered by the sheriff on the voters' list. Voting is **viva voce**. Qualified voters are eligible to office. The judicial power is vested in a court of queen's bench, county courts, and justices of the peace. The queen's bench consists of a chief justice and two puisne judges, appointed by the governor general in council, and has general jurisdiction. A county court, having inferior jurisdiction, is held for each county by a judge of the queen's bench without a jury. The records and journals of the legislature are kept and the laws are published in both English and French. Either language may be used in legal proceedings and in debates in the legislature. The common law does not prevail, but the general principles in force are the same as those recognized in Quebec, and are derived from Roman and French sources. Manitoba is represented in the Dominion parliament by two senators and four members of the house of commons (one from each county). The amount appropriated for the support of the government for 1872 was $81,425, including $7,000 for common schools. The salaries of the lieutenant governor and judges are paid from the Dominion treasury, besides which the province receives grants from the Dominion amounting in the aggregate to $67,204 50 per annum. The public schools are under the charge of a board of education of 14 members, of whom half are Catholics and half Protestants, one of the members acting as superintendent of the Catholic and another of the Protestant schools. There are 40 common schools (20 Protestant and 20 Catholic), three Protestant female schools, several conventual academies and schools controlled by the Catholics, and three colleges, viz.: St. John's (Episcopal), St. Boniface (Catholic), and Kildonan (Presbyterian). Three weekly newspapers are published in the province (one each in English, French, and German, and there are 32 post offices. A majority of the population are Roman Catholics; the other principal denominations are Episcopalians, Presbyterians, and Wesleyan Methodists. The Roman Catholics have an archbishop (archbishop of St. Boniface), and the Episcopalians a bishop (bishop of Rupert's Land). There are 32 churches, viz.: 15 Episcopal, 2 Methodist, 4 Presbyterian, and 11 Roman Catholic,—Manitoba forming part of the territory granted in 1670 by Charles II. to the Hudson Bay company, which in 1811 sold a tract, including what is now the province, to Thomas Douglas, earl of Selkirk. Under his auspices a colony was established, which was sometimes called the Selkirk settlement, but more commonly the Red River settlement. The first body of colonists arrived from the highlands of Scotland in 1812, and a second party in 1815, and settled on the Red river near its confluence with the Assiniboine. Subsequently other settlers arrived, including a number of French Canadians in 1818; and as the colony gained permanence many who had been in the employment of the Hudson Bay company (mostly native of the Orkney islands) and others connected with the fur trade, generally accompanied by Indian families, came in and took up their residence in the settlement. Until 1821, when the Northwest company was merged in the Hudson Bay company, the colonists suffered much from attacks by the employees of the former. In 1835 the Hudson Bay company bought back from the heirs of Lord Selkirk the territory granted to him in 1811, and established a more regular government than had previously existed, under the style of the governor and council of Assiniboia, giving it jurisdiction over the district embraced within a radius of 50 m. from Fort Garry. The officers were appointed by the company, the councillors being chosen from among the most influential citizens of the district. Settlements having been made W. of these limits, a provisional government was formed at Prairie Portage in 1867, with Mr. Spence as president and a council of eight members styled the council of Manitoba, but it dissolved before the annexation of the country to Canada. The act of parliament of 1867 creating the Dominion of Canada contemplated the acquisition by that government of the Hudson Bay territory, and Dec. 1, 1869, was subsequently fixed as the date of transfer. In the mean time an act of the Dominion parliament was passed providing for the temporary government of the entire region under the name of the Northwest territories, a measure respecting which the inhabitants of Assiniboia were not consulted. This fact, with other grounds of apprehension, caused much dissatisfaction. Upon the approach of William McDougall, who was to act as lieutenant governor of the Northwest territories, the French half-breeds, under the lead of Louis Riel, resolved to prevent his entrance, and that the government of the province be carried out by the people. These were conceded by the Manitoba act, which passed the Dominion parliament on May 20, 1870, and was accepted by the legislative assembly of Assiniboia on June 24, providing for the admission of the province from and after the day of the queen's proclamation annexing the Hudson Bay territory. The actual transfer of this region, delayed by the disturbances, took place July 15 in virtue of a royal proclamation of June 23. On Aug. 24 the 60th rifles, under Col. (now Gen.) Wolseley, entered Fort Garry, Riel having
previously vacated the place; and on Sept. 3
Mr. Archibald, the lieutenant governor of the
province, arrived. The troops soon returned,
and were replaced by Canadian militia.—See

River Troubles," by Alexander Begg (Toron-
to, 1871); "Manitoba and the Northwest of
the Dominion," by Thomas Spence (Toronto,
1871), and "Red River Country and its Re-
sources," by J. J. Hargrave (Montreal, 1871).

MANITOBA, Lake, a body of water in the
Northwest territories of Canada, intersected
by the 51st parallel and 99th meridian, situa-
ted about 60 m. S. W. of Lake Winnipeg, into
which it discharges through the Little Saskatchewan
or Dauphin river, which expands near the
middle of its course into St. Martin's lake.
Lake Manitoba is about 120 m. long from N.
N. W. to S. S. E., and has a breadth not ex-
ceeding 25 m.; area, about 1,900 sq. m. It is
40 ft. above Lake Winnipeg, and is navigable
by vessels drawing 10 ft., though its outlet only
admits small craft. At its N. extremity it re-
ceives through Water Hen river the waters of
Winnipegosis or Winnipegosis, Dauphin, and
Water Hen lakes, and at its S. extremity White
Mud river. It abounds in fish. The name sig-
nifies "supernatural strait," the Indians attrib-
uting the peculiar agitation of the water in a
portion of the lake to the presence of a spirit.

MANITOULIN, among some tribes of the American
Indians, the name of any object of wor-
ship. "The Illinois," wrote the Jesuit Marest, "adore a stone of genius, which they call mani-
tou; to them, it is the symbol of life, the spirit
that rules all things. A bird, a buffalo, a bear,
a feather, a skin—that is their Manitou." "If
the Indian word Manitou, says Palfrey, "ap-
peared to denote something above or beside
the common aspects and agencies of nature, it
might be natural, but it would be rash and mis-
leading, to confound its import with the Chris-
tian, Mohammedan, Jewish, Egyptian, or Greek
conception of Deity, or with any compound of
a selection from some or all of those ideas."

MANITOU, a county of Michigan, comprising
the Beaver, Fox, and Manitou islands in Lake
Michigan, off the N. W. coast of the lower pen-
insula; area, about 100 sq. m.; pop. in 1870,
891. The largest island is Big Beaver; the
other principal islands are Great Manitou, Lit-
tle Manitou, Little Beaver, Garden, Hog, South
Fox, and North Fox. The surface is rough and
the soil only moderately fertile. Capital, St.
James, on Big Beaver island.

MANITOULIN ISLANDS, a group stretching E.
and W. along the N. shore of Lake Huron from
Georgian bay to the N. peninsula of Michigan,
the principal of which are Great Manitoulin or
Sacred island, Little Manitoulin or Cockburn,
and Drummond's. All but the last (which
belongs to Chippewa co., Mich.) are included
in Algoma district, Ontario, Canada; area,
1,189 sq. m.; pop. in 1871, 2,011, of whom
1,562 were Indians. Great Manitoulin, about
80 m. long by from 5 to 30 broad, is deeply in-
dented by numerous bays, and has an elevated
and rugged surface, abounding in fine scenery.
The interior is densely wooded with pine, and
in the E. part are several lakes. Little Manitou-
lin, about 10 m. in diameter, resembles Great
Manitoulin in its general features. Drum-
mond's island is about 20 m. long by from 2 to
15 broad, and has an irregular surface, covered
with large masses of rock. It is separated from
the mainland of Michigan by a strait scarcely
a mile wide, which forms the principal passage
for vessels bound to Lake Superior.

MANITOWOC, an E. county of Wisconsin, bor-
dering on Lake Michigan, and drained by the
Manitowoc, E. and W. Twin, and Sheboygan
rivers; area, 612 sq. m.; pop. in 1870, 33,564.
The soil is fertile and heavily timbered, pine
lumber being the principal article of export.
The chief productions in 1870 were 517,146
bushels of wheat, 92,861 of rye, 386,759 of
oats, 30,176 of barley, 108,150 of potatoes, 80,-
410 of peas and beans, 44,421 lbs. of wool,
575,319 of butter, and 26,937 tons of hay.
There were 4,460 horses, 9,351 milch cows,
11,017 other cattle, 16,403 sheep, and 11,200
swine; 15 flour mills, 21 saw mills, 3 woolen
mills, 11 tanneries, 11 currying establishments,
and 10 breweries. Capital, Manitowoc.

MANITOWOC, a city and the capital of Mani-
towoc co., Wisconsin, on Lake Michigan, at
the mouth of Manitowoc river, and on the
Milwaukee, Lake Shore, and Western railroad,
105 m. N. E. of Madison, and 75 m. N. of Mil-
waukee; pop. in 1860, 3,058; in 1870, 5,188,
of whom 2,577 were foreign born, and there is a
good harbor and considerable trade, and contains
several ship-building establishments, tanneries,
and manufactories. There are a national bank,
graded schools, a semi-weekly and four weekly
(two German) newspapers, and five churches.

MANKATO, a city and the county seat of Blue
Earth co., Minnesota, on the right bank of the
Minnesota river, at the great bend, and on the
St. Paul and Sioux City and Chicago and North-
western (Minnesota division) railroads, 76 m.
S. W. of St. Paul; pop. in 1870, 3,482; in 1874,
about 6,000. It has an important trade
and thriving manufactures. The sales of mer-
chandise in 1873 amounted to $2,225,000; the
value of manufactures was $860,000. The
principal establishments are an extensive lin-
seed oil factory, two flouring mills, two plough
and agricultural implement factories, three
founderies, and manufactories of woolens,
bricks, furniture, and sash and doors. It con-
tains two national banks, a private bank, 15
hotels, three public halls, a driving park and
MANLEY

fair grounds, one of the state normal schools, three large public school buildings, a denominational school, a public library, four weekly newspapers (one German), and 11 churches.

MANLEY, John, an American naval commander, born at Torbay, Devonshire, Eng., in 1734, died in Boston, Feb. 12, 1798. He settled at Marblehead, Mass., and was master of a merchantman. At the outbreak of the revolutionary war he had command of the armed schooner Lee, with which he cruised along the coast of Massachusetts bay, making captures of great value to the American army then investing Boston. Among these was an ordnance brig laden with heavy guns, mortars, and intrenching tools. He was commissioned as a captain by congress Aug. 22, 1776; and on June 1, 1777, his ship, the Hancock, 32 guns, in company with the Boston, 24 guns, Capt. Hector McNeil, encountered the British frigate Rainbow, 44 guns. While Manley was preparing for action, McNeil deserted him; and knowing the disparity in strength, Manley tried to escape, but was chased and captured. After a rigorous confinement in Halifax, he was exchanged, and in 1782 was put in command of the Hauge frigate, which, after lying in a perilous position on a sand bank off Guadeloupe for three days, exposed to the fire of four British ships of the line, contrived to effect her escape. This exploit closed the regular maritime operations of the United States during the revolutionary war. Capt. Manley was subsequently tried by a court martial for the loss of the Hancock, but was honorably acquitted, while McNeil was dismissed from the service.

MANLEY (De la Riviere), Mary, an English authoress, born in Guernsey about 1672, died in London, July 11, 1724. She was the daughter of Sir Roger Manley, governor of the island of Guernsey, who was author of "History of the late Wars of Denmark" (1670), and Commentarii de Rebellione Angleia (London, 1686). He carefully educated his daughter, and dying when she was young committed her to the care of his nephew, who, having already another wife, enticed her into a marriage with himself and abandoned her in London. The duchess of Cleveland, formerly a mistress of Charles II., then took her under her protection, but soon deserted her. In this emergency she began to write for the stage. Her "Royal Mischief," a tragedy represented at Lincoln's Inn Fields theatre in 1696, brought her into great literary repute, and she almost immediately became the centre of a brilliant circle of men of fashion. Although engaged in numerous intrigues, she soon produced her "Memoirs of the New Atlantis" (4 vols., London, 1709), a romance describing with much freedom of language and under feigned names the amours of several distinguished characters. The work created so much scandal that a criminal prosecution was commenced against the printer and publisher, to screen whom from punishment she voluntarily declared herself in the court of king's bench the sole author. She was in consequence imprisoned for a time, but was subsequently released on bail. There were several later editions of the work, and it was translated into French. Upon the accession of the tortoys to power in 1710, she resumed her position as a leader of fashionable profligacy, and employed her pen with effect in behalf of the ministry, under the direction, it is said, and with the approval of Swift. The "Vindication of the Duke of Marlborough" and other political pamphlets testify to her industry; and she also conducted the "Examiner" for some time after it had been relinquished by Swift, and frequently finished pieces begun by him. Among her remaining works are: the comedy of "The Lost Lover, or the Jealous Husband" (1696); "Lucina, the First Christian King of Britain" (1717), a tragedy, for which Steele wrote the prologue and Prior the epilogue; and a variety of ephemeral novels, memoirs, dramas, and poems. During the last few years of her life she lived with her printer, John Bowles, who was alderman of London.

MANLI, one of the most celebrated patronage of ancient Rome, members of which held high offices in the state for about five centuries. The first of them who attained to the consulship was Cneius Manlius Cincinatus, consul in 480 B. C., who fell in battle against the Etruscans.—MARCUS MANLIUS CAPITOLINUS, consul in 392 B. C., obtained his surname, according to Livy, from his defence of the capitol against the Gauls (about 390). Roused from sleep by the cackling of the sacred geese, he hastily collected a force, and repulsed the enemy, who had already gained the summit of the hill. He incurred the enmity of the patricians by his defence of plebeian debtors, was accused of aiming at the kingly power, and was for a time imprisoned. After his liberation, he instigated the plebeians to take up arms, but was arraigned for high treason before the people in the Campus Martius, was condemned to death, and was thrown from the Tarpeian rock (381). The Manlian gens determined that the name of Marcus should be conferred in future upon none of its members.—The Torquati and Vulsones were families of the Manlian gens.

MANN, Horace, an American educationist, born in Franklin, Mass., May 4, 1706, died at Yellow Springs, Ohio, Aug. 2, 1859. His father was a farmer in limited circumstances, and the education of the son was obtained entirely from the common district schools until the age of 20, when he fitted himself to enter the more professorate of Brown university, at Providence, R. I., where he graduated in 1819. The theme of his oration, "The Progressive Character of the Human Race," foreshadowed his future career. After his graduation he was tutor in Latin and Greek in Brown university; subsequently he studied in the law school of Litchfield, Conn., was admitted to the bar in 1828, and opened an office in Dedham, Mass. In
1827 he was elected to the legislature, and immediately took an active part in the discussion of all important questions, especially such as related to morals, public charities, education, or the welfare of the poor, the ignorant, or unfortunate classes. He was foremost in procuring the enactment of laws for the suppression of intemperance and the traffic in lottery tickets, and for improving the system of common schools. The establishment of the state lunatic hospital at Worcester was due to his untiring efforts; he was chairman of the commission that erected the buildings, and in 1833 was chairman of the board of trustees of the institution. He continued to be returned by large majorities as a representative from Dedham till 1833, when he removed to Boston and entered into partnership with Edward G. Loring. At the first election after he became a citizen of Boston he was chosen a member of the state senate, and by re-elections was continued a senator for four years. In 1836 and again in 1837 he was president of the senate. While in the legislature he was a member and for part of the time chairman of the committee for the revision of the state statutes; and a large number of most salutary provisions were incorporated into the code at his suggestion. After the revised statutes were enacted, he was appointed in conjunction with Judge Metcalf to edit the work, for which he prepared the marginal notes and the references to judicial decisions.—At the organization of the Massachusetts board of education, June 29, 1837, he was elected its secretary, and for the next eleven years was annually relected. On accepting this office he withdrew from all other professional and business engagements and from politics. He introduced a thorough reform in the school system of the state; extensive changes in the law relating to schools were adopted; normal schools were established; school committees were paid; a system of county educational conventions was instituted; by means of "school registers" the actual condition of the schools was ascertained; and from the detailed reports of the school committees the secretary made valuable abstracts, which he embodied in his annual reports, forming several large volumes. In 1843, under the auspices of the board, but at his own expense, he visited Europe, to examine schools and to obtain such information as could be made available at home. His seventh annual report, made on his return, embodied the results of this tour. Many editions were printed, not only in Massachusetts, but in other states, sometimes by order of legislatures, sometimes by private individuals; and several editions were printed in England. This report, in which he advocated the disuse of corporal punishment in school discipline, involved him in a controversy with some of the Boston teachers, which resulted in the adoption of his views on discipline in the schools. The "Common School Journal," which he edited and much of which he wrote, consists of 10 vols. 8vo. He published a volume of lectures on education, at the request of the board. He travelled over the state every year to hold conventions or teachers' institutes, at which he often taught during the day and lectured in the evening. His correspondence was voluminous. He was continually called upon for legal opinions in regard to school matters, which he always gave gratuitously; and whenever the cases were brought before the courts, his opinions were invariably sustained. He superintended the erection of two state normal school houses, and drew plans and gave directions for hundreds of others. He says in his "Supplementary Report" in 1848: "From the time when I accepted the secretariatship in June, 1837, until May, 1848, when I tendered my resignation of it, I labored in this cause an average of not less than 15 hours a day; from the beginning to the end of this period, I never took a single day for relaxation, and months and months together passed without my withdrawing a single evening from working hours to call upon a friend. My whole time was devoted, if not wisely, yet continuously and cheerfully, to the great trust confided to my hands." In the spring of 1848 he was elected to congress, to fill the vacancy caused by the death of John Quincy Adams. On June 30 he made his first speech in maintenance of the right of congress to legislate for the territories of the United States, and its duty to exclude slavery therefrom. In the ensuing November he was re-elected, receiving 11,000 out of 15,000 votes. During his first session he volunteered as counsel for Drayton and Sayres, indicted for stealing 76 slaves in the District of Columbia, and at the trial was engaged for 21 successive days in their defense. In 1850 he engaged in a controversy with Daniel Webster in regard to the extension of slavery and the fugitive slave law, and Mr. Webster's famous speech of March 7 of that year. At the ensuing election in November Mr. Webster's friends succeeded in the whig convention in defeating by a single vote Mr. Mann's renomination. He, however, appealed to the people as an independent anti-slavery candidate, and was re-elected. His last speech in congress was on the slavery question, Aug. 17, 1852. On Sept. 15 the state convention of the free-soil party of Massachusetts nominated Mr. Mann for governor, and on the same day he was chosen president of Antioch college, a new institution just established at Yellow Springs, Greene co., Ohio. Failing in the election, he accepted the presidency of the college, and continued there until his death, laboring with zeal and energy in the cause of education and philanthropy. He carried the institution through its early pecuniary and other difficulties, and satisfied himself by the experiment that a college for the common education of both sexes was practicable.—Besides his annual reports, his vol-
The juice of the Manna ash (Fraxinus ornus) exudes in the summer months, from the punctures of an insect, Cicada orni, but is increased by transverse incisions made for the purpose in the bark. The finer kind, known as flake manna, is from incisions in the upper part of the stem; it dries upon the tree in long flakes, which when removed have the under surface conformed to the trunk of the tree and the upper of irregular and somewhat stalactitic appearance. The coarser kinds are obtained near the roots of the tree, where the juice is collected in joints of the prickly pear (Opuntia), or upon straw placed to receive it. It is an article of import for the sake of its medicinal qualities, and is obtained chiefly from Sicily and Calabria. The best is of a whitish or light yellow color in flakes and tears, while the poorer sorts are darker colored from the impurities with which they are mixed. It possesses a sweet, somewhat nauseous taste, and is soluble in water or in alcohol. From its boiling saturated solution it separates in slow cooling in crystalline form. It consists of a crystallizable sweet principle called mannite, which sometimes amounts to 75 per cent.; of true sugar; and of a yellow nauseous matter, which it is supposed gives to the manna its purgative property. For the sake of this it is used in medicine, and is commonly prescribed with other purgatives, as senna, rhubarb, magnesia, &c., the taste of which it conceals, while it increases their effect. When given alone, the dose for an adult is one or two ounces.—Various other saccharine exudations of plants are called manna; the manna of Briançon, which appears upon the twigs of the European larch (Larix Europaea), is formed during the night, and soon disappears after the sun falls upon it. Another substance called manna is obtained by the Bedouin Arabs from the Tamarix mannifera. After collecting it from among the twigs and leaves, they boil it, then strain it through cloth, and put it away in leathern bags to be eaten like honey with bread, as a delicate article of food. Dr. Robinson, in his “Biblical Researches in Palestine,” mentions its being collected in small quantities by the Arabs of Mt. Sinai, and sold at very high prices to the Russians. According to Berthelot, the tamarisk manna from Sinai contains 56 per cent. of cane sugar, 22 of inverted sugar, and 20 of dextrose, &c. Manna from Kurdistan contains 61 per cent. of cane sugar, 16.6 of inverted sugar, and 28.5 of dextrose. The Sinai manna is soluble in water or alcohol, and the aqueous solution readily undergoes fermentation, yielding an alcohol possessing a butyric acid odor.

—Though the name is probably derived from the Syriac mano, a gift, which was applied to the Scriptural manna, it cannot be proved that there is any relationship between the natural products designated by this name and the substance mentioned in Scripture (Heb. man) as miraculously supplied to the Israelites.

MANNHEIM, or Mainz, a town of the grand duchy of Baden, capital of the circle of the Lower Rhine, situated on the right bank of the Rhine, at the confluence of the Neckar with that river, 43 m. S. W. of Frankfort; pop. in 1871, 39,614. It is connected by steamers with Cologne and other places on the Rhine, and by railway with the principal towns of Europe. Goethe has appropriately called it “the pleasant, cleanly Mannheim.” The regularity of the buildings, however, gives it a somewhat monotonous appearance. It consists of 111 regular squares. It is divided into two parts by the great street leading from the palace to the suspension bridge over the Neckar. The principal public squares are the Plankenplatz and the Schillerplatz, where Schiller resided in the house called zum Karlberg, and which is
adorned with fountains, and statues of Schiller, Dalberg, and Iffland. The theatre is a fine building, and in it Schiller's "Robbers" was first acted. Behind the palace, which contains collections of art, a large library, and a cabinet of natural history, are beautiful gardens, ending in a raised terrace upon the brink of the Rhine (Rheinadeln). Along the banks of the Neckar, in the outskirts of the town, are handsome private gardens, and a broad avenue (Plankenstrasse) between the Heidelberg and Rhine gates is planted with trees. In spite of its fine position on two navigable rivers, the trade of the place was formerly unimportant; but of late years, owing to its railway connections, it has become the first commercial town in the grand duchy. The town was founded in 1606, and from 1720 to 1777 it was the capital of the Palatinate. It suffered severely in the thirty years' war, and was almost destroyed by the French in 1688 after a siege of 17 days. It was soon rebuilt, and was strongly fortified in 1699; but in the early part of the present century the ramparts were removed. During the wars of the revolution, the French attacked the town in December, 1794, and occupied it Sept. 20, 1795. During the long siege only 14 houses remained uninjured, and half of the palace was burnt. By the peace of Lunéville (1801), Mannheim was allotted to Baden.

MANNING, Henry Edward, an English Roman Catholic archbishop, born at Totteridge, Hertfordshire, July 15, 1808. He was educated as a member of the Anglican church at Harrow and Balliol college, Oxford, graduated in 1820, and was chosen fellow of Merton college and one of the select preachers in the university. In 1834 he was appointed rector of Lavington and Graffham in Sussex, and in 1840 archdeacon of Chichester. In 1842 he published his first work, on the "Unity of the Church," which classed him among the Puseyites. Two volumes of sermons published respectively in 1842 and 1846 attracted much attention. He also published three series of "Sermons preached before the University of Oxford" (1844, 1848, and 1850). The Gorham decision, leaving the doctrine of the effect of baptism an open question in the church of England, called forth a declaration from him, and other well known clergymen and laymen of the establishment, that, unless that decision was formally repudiated, it would be of binding force upon the English church. They strove to free that which they conceived to be the church of Christ from submission to a doctrinal decision given by the crown. Their attempt, however, was without result, and, with the exception of one or two protests, the action of the court was acquiesced in. Dr. Manning consequently gave up his preferments in 1851, and was received into the Roman Catholic church. He then went to Rome, where he remained till 1854. In 1857 he was ordained priest by Cardinal Wiseman, and appointed rector of St. Helen and St. Mary's, Bayswater, where he established a house of Oblates of St. Charles Borromeo, an association of secular missionary priests founded in the 16th century. About the same time the degree of D. D. was conferred on him by Pius IX., with the office of provost of the Roman Catholic diocese of Westminster and the rank of prothonotary apostolic. On the death of Cardinal Wiseman, Dr. Manning was nominated by the pope archbishop of Westminster, and consecrated June 8, 1865. He immediately set about promoting temperance, benevolent guilds, and elementary education among the poor Catholics of London, and purchased a site for a cathedral which was to be a memorial to Cardinal Wiseman, but declared that not one stone of this edifice should be laid till every poor child in his flock was provided with a Catholic free school. In 1871 he conceived the project of a Roman Catholic university, appealed to the public, created a fund, and organized a senate and a corps of professors. The institution was opened in Kensington Oct. 15, 1874. On July 2, 1869, he dedicated the pro-cathedral of Our Lady of Victories, Newland terrace, Kensington. At this time a controversy arose between Archbishop Manning and Bishop Dunlap on concerning the opportunity of urging a definition of the doctrine of papal infallibility. The archbishop before departing for the eccenical council addressed a pastoral letter to his flock on the question of infallibility, which, with two others on the manner in which the deliberations of the council were conducted, and in elucidation of the defined dogma, was published, with the title of Petri Privilegium (London, 1871). In 1868 he addressed to Earl de Grey a remarkable letter on Ireland, in which he sets forth the mischief of English misrule in that country, and pleads strongly for justice. Since then he has been prominent in encouraging the "Home Rule" movement, and has taken an active part in denouncing the course pursued in Germany and Switzerland toward the Roman Catholic church. The principal works of Archbishop Manning, besides those mentioned, are the following: "The Temporal Mission of the Holy Ghost" (London, 1865); "The Temporal Power of the Pope in its Political Aspect" (1866); "England and Christendom" (1867); "The Fourfold Sovereignty of God" (1871); and "Sermons on Ecclesiastical Subjects" (1875).

MANNING, James, an American clergyman, born in Elizabethtown, N. J., Oct. 22, 1738, died in Providence, R. I., July 29, 1791. He graduated at Princeton college in 1762, became pastor of a Baptist church at Morristown, N. J., in 1763, and soon afterward in Warren, R. I., where he opened a Latin school. In 1783, at the request of an association formed for the purpose in Philadelphia, he proposed to several influential gentlemen of the denomination, assembled at Newport, the organization of "a seminary of polite literature, subject
to the government of the Baptists," and drew up a plan for such an institution. In 1764 the legislature granted them a charter, and in 1765 Mr. Manning, then but 27 years of age, was appointed "president and professor of languages and other branches of learning, with full power to act in these capacities, at Warren or elsewhere." The college went into operation at Warren in 1766, and on its removal to Providence in 1770, Mr. Manning went with it, and also became pastor of the first Baptist church in that place. During the revolution, when the college edifice was occupied as a military barracks, and afterward as a hospital, he was actively engaged in clerical duties, and also rendered important services to the patriotic cause. In 1783 he resumed his duties at the college, and in 1785 he was chosen to represent Rhode Island in congress, but after six months' service resigned. He resigned the presidency of the college in 1790, and his pastorate in April, 1791. (See Brown University.)

MANITE, or Mannite, also called sugar of manna and sugar of mushrooms (C,H,O), one of the glucoses, which was discovered by Proust, and its composition determined by Liebig. It exists in a great number of vegetables, and in the saccharine juices which have undergone viscous or lactic fermentation; it is generally extracted from manna, by digesting this substance with boiling alcohol, filtering while hot, and crystallizing; it should be purified by repeated crystallizations. On the transformation of starch into glucose by boiling with dilute sulphuric acid, it is also formed as a secondary product; and finally Linnemann in 1862 obtained it by the action of nascent hydrogen on glucose. Mannite is a solid substance, fusible between 160° and 165° C., and when once melted it can remain liquid at 140° C. It exercises no action on polarized light; it dissolves in 6⅔ times its weight of water at 18° C., and in 80 parts of cold alcohol of the strength of 89 per cent., and much more readily in boiling alcohol. It is not soluble in ether, and absolute alcohol only dissolves 14 per cent. of its weight of mannite. Mannite crystallizes in anhydrous, thin, colorless, four-sided, silky prisms, which sometimes grow to a considerable size. It does not ferment except under very unusual conditions; does not reduce oxide of copper to the state of suboxide, but binders the precipitation of sulphate of copper by the fixed alkalies, causing the formation of a beautiful blue-purple solution instead. In its chemical character, mannite is now regarded as a polyatomic (hexatomic) alcohol. Berthelot has shown its close analogy to glycerine, and has obtained a great variety of salts (called mannitnides) from it by heating mannite with different acids to a temperature of between 200° and 250° C. With a mixture of nitric and sulphuric acids it gives nitro-mannite. The nitrates of silver and mercury and the chlorides of silver and mercury are not reduced by mannite even at boiling heat; the acetate and oxidede of silver, however, if heated with mannite or left in contact with it at ordinary temperatures, yields a speculum of silver. Compounds of mannite with barium, calcium, strontium, &c., have been prepared by Ubaldini. In the presence of beer yeast mannite does not ferment; but if its solution be maintained at 40° C., after having been mixed with chalk and poor cheese, pancreatic tissue, or albumen, fermentation takes place, hydrogen and carbonic anhydride are disengaged, and alcohol is produced along with lactic and butyric acids.

MAN-OF-WAR BIRD. See Frigate Bird.

MANOMETER (Gr. μανχος, rare, and μέτρον—measure—measurer of rarity), an instrument employed to measure the pressure exerted by a confined portion of gas or vapor. The force is usually expressed in units of atmospheric pressure, called atmospheres, which are equal to 30 inches height of a column of mercury, or nearly 15 lbs. to the square inch. It will therefore be easily shown that the rarefied atmosphere above the earth's surface is capable of sustaining several forms of the instrument. These various forms may be classified under three different general forms, which act upon different principles: 1, open-air manometer; 2, confined-air manometer; 3, metallic-spring manometer. An open-air manometer is shown in fig. 1. It consists of a vessel containing mercury in which a vertical tube b dips. The vessel also admits a tube, a, which connects with the boiler or chamber of compressed gas or steam. Calling Boyle's or Mariotte's law correct for all pressures, if the compressed gas has a density twice as great as it would have at the ordinary atmospheric pressure, it will raise the column of mercury in the tube 830 inches; if five times as dense, the height of the mercurial column will be 150 inches, corresponding to 75 lbs. to the square inch. There may be many forms of open-air manometers, and the modifications are generally for the purpose of increasing the convenience of the apparatus by shortening the distance of the rise of the mercurial column.

The multiple-branch manometer, fig. 2, is a convenient form. An iron tube is bent upon itself, forming several U-shaped flexures, terminating in a vertical tube of glass, C D, furnished with a graduated scale, and open at the top. Mercury occupies the lower flexures and portions of the tube. When the compressed steam or gas is admitted, it presses upon the mercury in the first branch, A, forcing it down, and therefore up in the second branch. If it forces A down 10 inches, the difference of level in the two branches will be 20 inches. If there are 10 single or 5 double
columns, the combined height of mercury supported in column will be 100 inches, or about 66 atmospheres. The compressed-air manometer, fig. 2, is constructed upon the assumption that the confined air in the gauge expands and is condensed in accordance with Boyle's law. \( A \) is a \( U \)-shaped glass tube, one end of which communicates with the steam chamber, while the other end is closed. It has its flexure stopped with mercury, and a scale is attached, which is graduated by connecting the apparatus with an open-air manometer. It will be seen that as the mercury in \( A \) rises, the pressure is doubled for every reduction of the confined air to one half its volume, so that as the column approaches the top the graduated spaces must be nearer together. The metallic-spring manometer may be constructed by having a piston press against a spiral spring, which is also connected with an index; or a flat copper tube (elliptic section), bent in a spiral, may be connected at one end with the steam chamber, and at the other with an index, as in Burdon's pressure gauge, shown in fig. 4. Increased pressure causes the spiral to uncoil, by which the index is moved over the graduated arc.

**MANSEREA**, a town of Spain, in the province and city of Barcelona, near the left bank of the Llobregat river; pop. about 15,000. It is one of the most picturesque towns in Catalonia and the centre of a rich farming district, and has extensive manufactures of broadcloth, cotton, silk, tape, ribbons, gunpowder, and brandy. The streets are clean and well paved, but many of them are crooked and steep, and lined with quaint old-fashioned houses. There are some elegant churches and other public buildings, and in the neighborhood is the famous monastery of Montserrat, and the "cave of St. Ignatius," where Loyola passed some time in retirement before founding the society of Jesus. Manresa was taken by the French under Macdonald, March 30, 1811, when more than 600 buildings were burned, including hospitals and churches. This wanton act so incensed the Catalans, that they fell upon the rear of the French army on its march to Barcelona, and destroyed 1,000 men.

**MANS, Le**, a town of France, capital of the department of Sarthe, 118 m. S. W. of Paris, on the W. bank of the river Sarthe, here crossed by three bridges; pop. in 1872, 49,981. It is the seat of a bishop, consists of an old town and a new town, has a considerable trade in local products, and manufactures coarse woollens, yarns, lace, linen, paper, and soap. The cathedral of St. Julien, dating from the 12th century, is famous for its fine Gothic choir and painted windows. It is a place of great antiquity, having been founded in the 2d century by the Romans, and called Subindinum or Cenomani, after the Gallic people of the same name, in whose territory it was situated. During the war of the league Le Mans was captured by Henry IV.; and in December, 1793, it was the scene of the destruction of the Vendean army, when more than 10,000 persons were slaughtered. On Jan. 11 and 12, 1871, the French army of the Loire, under Gen. Chanzy, was here defeated and almost annihilated by Prince Frederick Charles of Prussia. The town itself was occupied by the Germans on Jan. 12.

**MANSART, J. Françoise**, a French architect, born in Paris in 1598, died there in 1666. At the age of 22 he distinguished himself by the restoration of the hôtel Toulon. In 1624 he attracted the attention of Cardinal Richelieu, who commissioned him to erect the church of the Feuillants in the rue St. Honoré, and he was subsequently employed in many other great works in Paris and in the provinces. Among the numerous châteaux erected from his plans are those of Berny, Blérancourt, Choisy, Gévres, Fresnes, and MAISONS. He built the façade of the church of the
MANSFIELD, an ancient noble family of Germany, taking its name from the castle of Mansfield, the original seat of the family, and now in the town and circle of Mansfield in Prussian Saxony.

MANSFIELD, a town of Tolland co., Connecticut, on the New London Northern railroad, 25 m. E. of Hartford; pop. in 1870, 2,401. It is bounded W. by the Willimantic river, and is intersected by the Natchaug and its branches. Mansfield is chiefly noted for the manufacture of silk goods, containing eight establishments. There are also a manufactury of cotton goods, one of spool thread, and one of machinery.

It was formerly noted for the growing of mulberry, which was introduced nearly 100 years ago; but
MANSFIELD

little is now produced. Mansfield is the seat of the state soldiers' orphans' home, and contains 7 post offices, 16 schools, and 4 churches. MANSFIELD, a city and the capital of Richland co., Ohio, situated near the centre of the county, 65 m. N. by E. of Columbus; pop. in 1850, 3,857; in 1860, 4,581; in 1870, 8,029. It is compactly built on a beautiful and commanding elevation in the midst of a fertile and populous region. It has a number of handsomely built churches, containing several of the church buildings, and the court house, which cost $227,000. Many of the residences are elegant and surrounded by spacious grounds. Four railroads intersect here: the Sandusky, Mansfield, and Newark; the Pittsburgh, Fort Wayne, and Chicago; the Atlantic and Great Western; and the Mansfield, Coldwater, and Lake Michigan. The wholesale trade is important, amounting to about $5,000,000 a year. The annual value of manufactures is about $8,000,000, the principal articles being threshing machines, saw mill and foundery products, machinery, woollens, paper, boilers, carriages, furniture, flour, &c. There are three national banks, a state bank, an insurance company, a bank of deposit in the Holy system, five public school houses, four weekly newspapers (one German), a library of 3,500 volumes, and 15 churches.

MANSFIELD, William Murray, earl of, a British jurist, born at Soone, Perthshire, March 2, 1705, died in London, March 20, 1738. He was the third son of Viscount Stornmont, a Scotch peer of Jacobite tendencies, several of whose family became deeply involved in the rebellion of 1745. Removed to London at an early age, he was educated at Westminster school, and at Christchurch college, Oxford. In 1721 he was called to the bar, and being of a vivacious temper, with the advantages of aristocratic connections and signal personal graces, he became a companion of wits and men of letters, and in particular gained the friendship of Pope. Almost at the outset of his career a new class of business, that of appeals from the court of session in Scotland to the house of lords, fell into his hands, and his emoluments were very large. His advance was rapid, and in 1734 he was appointed solicitor general, having the year previous entered parliament for Boroughbridge, for which place he was afterward returned in 1747 and again in 1754. As a legislator he displayed an eloquence "of which the clear, placid, and mellow splendor was never for an instant overclouded," and a depth and variety of knowledge which brought him into great prominence, while at the same time his peculiar political views exposed him to the attacks of Pitt, who frequently taunted his rival with his Jacobite connections and presumed sympathies. In 1747 he was one of the managers for the impeachment of Lord Lovat, and performed his part in so generous a spirit as to decline a raise from the patron himself. In 1754 Mr. Murray was appointed attorney general, and in 1756 succeeded Sir Dudley Ryder as chief justice of the king's bench, and was created Baron Mansfield of Mansfield in the county of Nottingham. So important were his parliamentary services to his party, that extraordinary efforts were made by the duke of Newcastle to retain him in the house of commons, as a government leader. He was offered various lucrative offices with large salaries, and finally a pension of £6,000 a year, but steadily refused them all, regarding the situation of chief justice as preferable to the responsibilities and labors which the chancellorship, the premiership, or any other merely political office involved. Contrary to general usage, though not to precedent, he became when appointed chief justice a member of the cabinet; and in 1757, while temporarily holding the office of chancellor of the exchequer, at the request of the king he effected the coalition between Newcastle, Pitt, and Fox, which resulted in the celebrated first administration of Chatham. He participated on important occasions in the proceedings of the house of lords, where Lord Camden and subsequently Chatham became his chief antagonists. On questions affecting popular privileges or influence he showed a decided leaning toward an arbitrary government. The stamp act, which he aided in preparing, found in him an earnest and able advocate, and the doctrine of taxation without representation was by no one more persistently defended. In reference to the agitation in the North American colonies which preceded the repeal of the act, he held that the Americans must first be compelled to submit to the power of parliament, and must exhibit "the most entire obedience" before an inquiry could be had into their grievances. The utterance of opinions like these marked him out as an object of popular dislike and party warfare, and for many years he was attacked with a vindictiveness which found its fullest expression in the letters of Junius, by whom "all the resources of the English language were exhausted in desolating and unpunished party libels on the chief justice of England." He nevertheless performed his judicial duties with dignity and courage; and on the occasion of the application of Wilkes in 1768 for the reversal of his outlawry, when public excitement had reached an almost unprecedented height, and the chief justice had been repeatedly threatened in anonymous letters, he announced to the partisans of Wilkes, who crowed Westminster hall, his contempt for the means that had been taken to deter the court from its duty. His unpopularity was still further increased by his direction to the jury in the trial of Woodfall, the publisher of Junius, "that the printing and sense of the paper were alone what they had to consider of." This attempt to restrict the right claimed by juries, in criminal prosecutions for libel, of determining whether a paper was false or not, brought upon Lord Mansfield the charge of arrogating to himself the functions of a le-
In the Gordon or "no popery" riots of 1780 his house in Bloomsbury square, with its valuable library of books and manuscripts, his private papers, furniture, and other valuables, was destroyed by the mob, from whose fury he only escaped by taking refuge in Buckingham palace. He bore these misfortunes with a calmness which seemed to disarm his enemies, declining any pecuniary compensation from the treasury; and during the remainder of his life parties generally united in a feeling of respect for his character and virtues. He retained his office of chief justice till 1788, having in the interim several times declined the chancellorship, and passed the last few years of his life in retirement. He left no children, and his title of earl of Mansfield, granted in 1778, descended to his nephew Viscount Stormont, to whom the greater part of his large property was bequeathed. The title of Baron Mansfield expired with him. As a jurist the character of Lord Mansfield contrasts favorably with the timidity and narrow-mindedness which marked his legislative career; and when not influenced by political views his decisions were almost uniformly correct. Commencing his judicial career as a reformer, he aimed at expediting legal proceedings, and by diminishing the expenses of suitors, and preventing unnecessary delays, caused the business of the courts, though greatly increased, to be despatched with unexampled rapidity. Gifted with an acute and powerful intellect, and with a wonderfully retentive memory, he was in the habit of considering the intent and spirit of the law rather than its letter; but his eagerness to discourage technicalities, and reverence of the principles of the civil law, occasionally led him to make the law instead of expounding it. In constructing a system of jurisprudence and adapting a progressive state of society to circumstances and cases entirely new, he was eminently successful; and English commercial law, particularly that branch of it relating to marine insurance, will be an enduring monument of his genius and industry. His conduct on the bench was marked by great dignity and amiability of manners, and in general he showed himself so worthy of his high office that Lord Chatham, for many years his determined political opponent, comparing him with two of the most illustrious British jurists, Somers and Holt, exclaimed: "I vow to God, I think the noble lord excels them both in abilities." Though opposed to liberal ideas, he was uniformly tolerant in matters of religious opinion. His arguments and decisions are preserved in Atkin's, Burrow's, Douglass's, and Cowper's reports; and his life has been written by John Holliday (1797), Henry Roseo (1839), and Lord Campbell in "Lives of the Chief Justices" (1849—57). See also "Sketches of Statesmen who flourished in the Time of George III," by Lord Brougham (1839—43); and "The Judges of England," by Edward Ayscough (1848—64).

MANSFIELD. In the article Homeric, it is said that felonious homicide is either manslaughter or murder. These two are distinguished from each other by the intent which causes or accompanies the act. If a homicide be not justifiable nor excusable, and yet be not committed with malice aforethought, it is manslaughter. It is quite certain that the intent need not be to kill; for while there must be a criminal intent to make a person amenable to law as a criminal, yet if one crime be intended, and in the act of committing another of a higher character be also committed without intent, the criminal is responsible for this higher crime. The general principle laid down in respect to manslaughter is, that not only a positive intention to commit some crime, but mere negligence, may make one guilty. If any one take upon himself an office or duty requiring care or skill, he is liable for the want of either; and if death be the consequence of his ignorance or carelessness, he is guilty of manslaughter. So if one driving furiously run over and kill a person whom he did not see, or if one in command of a steamer or sailing vessel run over a group of passengers, run down a boat and some one in it be drowned, this would be manslaughter. So if any one, whether medical by profession or not, deal with another as a physician, and through gross want of care or skill kill him; or if any one charged with building a house of any kind construct it so badly that it falls and kills persons within or near it; or if in building he drop a stone upon some one passing below, and kill him; in all these cases he would be guilty of manslaughter, provided he were grossly negligent in the act causing the death. This is the essential question; thus, in the last case where he were to build a house where few persons were, and it was by a rare occurrence that some one happened to be where the stone fell, it is said that there would be no such negligence as would make the killer responsible as a criminal; while, on the other hand, if it were a crowded thoroughfare, and the person dropping the stone gave no notice or warning and used no precaution to prevent mischief, the crime would then amount to murder. So if one ride a vicious horse, who kicks some one to death, it is no crime whatever if the rider did not know his character and did nothing by his carelessness to bring about the fatal result; but if he knew that the animal was vicious, and carelessly rode him near a crowd and exposed him to alarm likely to make him run into the crowd and do mischief, then the killing would be manslaughter. Sometimes it is said that if manslaughter be charged upon one on the ground of negligence only, without intent, this charge can be sustained only by evidence of the grossest negligence. It has been
held that the mere omission to do an act cannot, although death ensue, make the man guilty of manslaughter. But if the omission were of an act which was certainly a duty, and such an act that any reasonable person must know that its omission would be very dangerous to life, the principles of criminal law would lead to the conclusion that this might be manslaughter. Thus, a man employed to wall a shaft in a colliery, and whose duty it was to place a stage over the mouth of the shaft, having omitted this, and a man being thereby killed, the court of king's bench held him guilty of manslaughter. It seems to be agreed that if the act omitted were a legal duty, it would certainly amount to that crime. It should be added that the law always presumes (in the absence of clear proof to the contrary) that a man intended to do the thing he actually did, and intended the consequences which naturally and actually flow from his act; and this principle applies even where the act causes death. So a very nice distinction is taken in law between a malum prohibitum and a malum per se. Thus, if there be a law prohibiting the shooting of woodcocks before the 4th of July, one who shoots at one in June intends to break a law; but if, while thus shooting, by mere accident and without negligence, he should kill a man, this would be no crime, because shooting a woodcock at that season is an offence only because the law has made it so. But if he shoot at his neighbor's poultry, and by accident kill his neighbor, this is manslaughter; because the destroying his neighbor's property was an offence of itself, independently of municipal law. But by far the most frequent and most difficult questions in practice are those which must be determined either by the means used to produce death, or by the presence or absence of previous hostile intention. It is a general rule, that if one kills another with a deadly weapon, it is more than manslaughter; and in such a case, it follows from the principle, that whether the weapon used be a deadly weapon or not, is not a question of fact for the jury, but a question of law for the court. (See Murder.) The other question, as to previous hostility, generally turns upon the preliminary question, whether the act was committed in the "heat of passion," or under sudden provocation. If one, being angry, attacks another, his anger is not an entire excuse. But if a quarrel and conflict ensue, and the assailant kills the man whom he attacked, while this is a felonious homicide, it is not murder, because there is an absence of that malice aforethought which is of the essence of murder; and therefore it is manslaughter. Still further would it be from murder if the party killing had been himself attacked. But neither would this excuse the act if it were not made necessary by the nature of the attack; but it would reduce the crime to manslaughter. Here, however, it is to be remembered that such a quarrel makes that to be only manslaughter which would otherwise be murder, for no other reason than because it negatives the supposition of malice aforethought. If therefore this be proved, as if it be shown that the killer had a grudge against the deceased, and had manifested a violent hatred and intention to injure him, it might be inferred that he provoked the quarrel merely to give him the opportunity of gratifying his malice. In such a case the quarrel, instead of negating malice, would help to prove it; and therefore, of course, it could not have the effect of reducing the felony to manslaughter. So if there had been a quarrel and much provocation, and the quarrel had abated, and one of the parties withdrew and provided himself with a dangerous weapon, and returning killed the other, the excuse of "heat of passion" would not apply, for there would then be evidence of deliberate purpose. So, too, let the provocation be what it may, if there be no excitement or heat of passion, the killing will be deemed deliberate and intentional. Still, where there was much provocation, and no evidence of hostile purpose previous to the provocation, the killing itself would generally be deemed evidence of excited temper. There are other cases which the law regards as only manslaughter, without evidence of momentary excitement; partly because the law infers that from such a provocation there must be excitement; and partly, perhaps, because the party killed brought his death upon himself by his outrageous wrong. Thus, if a husband detects his wife in adultery, and instantly and purposely takes either her life or her paramour's, it is only manslaughter. Not so, however, if he waits for a subsequent opportunity, for then the first reason wholly fails, and the killing becomes murder. In one English case, where a man had his pocket picked, and with the assistance of others threw the thief into a pond to punish him by a ducking, and the man was drowned, this was held only manslaughter. Questions of this kind are not so frequent, and at so much time so difficult, that the legislatures of many of the United States have endeavored to aid in their determination by discriminating between different classes and degrees of manslaughter, defining each degree, and affixing to it appropriate punishment. We have no space to speak of these in detail, but to illustrate the prevailing principles of classification refer to the statutes of New York. By these, four degrees of manslaughter are defined. The first degree, briefly stated, consists of killing without the purpose of death, when the deceased was engaged in perpetrating or attempting a crime less than felony, and where such killing would be, at common law, murder. Assisting in self-murder is manslaughter in the first degree, as also wilfully killing an unborn quick child by injury to the mother, if it would be murder in case the mother died from the injury. The second degree consists in procuring abortion otherwise; killing in the heat of passion without the intent of death, but in a cruel and unusual man-
ner; or killing unnecessarily one attempting to commit a felony. The third degree is killing in heat of passion, without intent of death, but with a dangerous weapon; involuntary killing, by procurement or negligence of another, while the person killed is engaged in committing a trespass on property; suffering an animal known to be miscible to go abroad without care, or keeping it without care, and thereby causing death; receiving wilfully or negligent-ly so many persons into a boat or vessel as to cause death; racing while in command of a steamboat carrying passengers, bursting the boiler, and so killing; killing by a physician while in a state of intoxication. The fourth degree may be said to include all other modes of manslaughter, known as such at common law, and of a milder kind than the preceding.

MANT, Richard, an English bishop, born in Southampton in 1776, died in November, 1848. He was educated at Winchester and Trinity college, Oxford, and was chosen fellow of Oriel college in 1798. He became vicar of Great Goggeshall, Essex, in 1810; of St. Botolph's Bishopsgate, London, in 1815; and of East Horsley, Surrey, in 1818. In 1820 he was made bishop of Killaloe and Killfenora, Ireland; was translated to Down and Connor in 1828; and received in addition Dromore in 1842. His most important works are: "An Appeal to the Gospel, or an Inquiry into the Justice of the Charge that the Gospel is not preached by the National Clergy" (Bampton lectures for 1812; 6th ed., 1846); "Sermons" (3 vols., 1813-16); in conjunction with Dr. D'Oyly, an edition of the Bible, with notes for family use (republished in New York, under the super-vision of Bishop Hobart, 1818-20); "Book of Common Prayer, with Notes" (1820; 5th ed., 1840); "Happiness of the Blessed considered" (1833); "History of the Church of Ire-land" (2 vols. 1839-41); and "Horse Literature" (1845). He also published volumes of poems.

MANTCHOORIA, or Mantchuria, the land of the Mantchoos, a country of Asia, a dependency of the Chinese empire, bounded N. by the Amoor river, which separates it from the Russian province of the Amoor, E. by the Usuri river, which separates it from the Russian district of the Amoor, S. by Corea and the Yellow sea, and W. by Mongolia, between lat. 40° and 53° 30′ N., and lon. 115° and 135° E.; area about 400,000 sq. m.; pop. estimated at 3,000,000. Formerly the territory extended to lat. 55° N. and lon. 142° E.; but in 1858 China ceded all of Mantchooria N. of the Amoor and E. of the Usuri river. (See Amoor Country.) A large part of this country is an uninhabited wilderness, but little of it has been visited by Europeans. Nearly the whole of it is drained by the Amoor river and its branches. There are few lakes; the most important of them is Lake Khan-ka, which is 40 m. long and 25 m. broad. The province is traversed by several mountain chains. The Sih-li-hih mountains ex-

tend from the boundary of Corea in a N. E. direction. The S. W. portion of this range bears the Mantchoo name of Shan Aliin, and the Chinese name of Shangpe-shan or Long White mountains. The Illykhoori Aliin, in the north, forms three sides of the extensive valley of the upper Nonni, its eastern branch extending between the Amoor and the Songari to near their junction. The Khiingan mountains, running N. and S., and rising to a height of 15,000 ft., form part of the W. boundary. The greatest part of Mantchooria is covered by forests, the abode of wild animals, many of which afford valuable furs. Among them are bears, wolves, deer, the argali, and the dziggetai. The rivers and coasts abound in fish, among which carp, sturgeon, salmon, pike, and shell fish are especially plentiful. Among the birds of prey is a vulture which in size and fierceness rivals its congener the condor of the Andes. The southern part of Mantchooria is cultivated, and produces wheat, barley, pulse, millet, buck-wheat, and silk. It also supports large herds of horses, cattle, and sheep. Ginseng and rhubarb are a government monopoly. The country is rich in iron and coal. The climate of the greater part of Mantchooria resembles that of Canada in the contrasts of temperature in different seasons; in summer varying from 70° to 80°, while in winter in the northern parts snow is abundant, the ground is frozen to a considerable depth, and the mercury ranges from 45° above to 10° below zero.—Mantchooria is divided into three provinces, Liaotung or Shinkping, Ginrin, and Saghalin-ulu. Liaotung contains a population, according to the Chinese census of 1812, of 2,187,286; the others together about 1,000,000. Liaotung is, however, sometimes included in China proper. The three capital cities are Mukden or Shing- yang, Ginrin, and Tsitizkhar. Mukden is 360 m. N. E. of Peking, and in a large city, 144,000, in area, and 10 m. in circumference. Jing- king, 60 m. E. of Mukden, is also a considerable city; it was formerly the family residence and the family burial place of the Mantchoo emperors of China. Kingehow, on the gulf of Liaotung, S. W. of Mukden, of which it is the port, carries on a considerable trade in cattle, provisions, and drugs. Its harbor is shallow and unsafe. Kaichow, on the E. side of the gulf, has a better harbor. Ginrin is a very extensive province, but thinly inhabited.—The Mantchoos belong to the Tangnic branch of the Mongolian division of mankind. They are of lighter complexion and have not been so far as the Chinese, and some of them have fair complexion, blue eyes, aquiline noses, brown hair, and heavy beards. They have the same peculiar conformation of the eyelids as the Chinese, and resemble them closely in other respects; but their countenances are generally of a higher intellectual cast, and their charac- ter haughtier and more determined. They are the dominant race in the Chinese empire, being dispersed over the whole of it as officers and
MANTENGA

soldiers, and the skill and energy with which they have governed their vast dominions since 1644, when they took possession of the throne, show them to be possessed of high qualities. During the same period they have greatly improved the condition of their own original country. When the Mantchoos conquered China, they imposed upon the subject people a portion of their dress and many of their usages. The mode of arranging the hair in a tail now in use by the Chinese was forced upon them by the Mantchoos, to whom it had long been familiar. On the other hand, they have adopted many of the customs of the Chinese. They began to be conspicuous in eastern Asia about the beginning of the 17th century, when after a long series of internal wars their tribes were united into one nation under a chieftain named Tien-ming, who in 1618 declared war against China, then ruled by the Ming dynasty. He overran and devastated the N. E. provinces, but died about 1627, leaving the prosecution of his design of conquest to his son Tien-tsung, who made alliances with rebels whose leaders pretended to be rightful heirs to the throne. With their aid he made himself master of Peking, and the last of the Chinese emperors, Hiwai-tsung, having committed suicide in 1644, the Mantchoo chief took possession of the government. He died in 1644, and his son and successor Shun-chi is regarded as the first emperor of the Mantchoo dynasty which still holds the throne. (See CHINA.)—An account of the country, by the archimandrite Palladius of Peking, was communicated to the British royal geographical society in 1872. (See TURANIAN RACES AND LANGUAGES.)

MANTENGA, Andrea, an Italian artist, born near Padua in 1491, died in Mantua, Sept. 13, 1550. When quite young he was placed under the instruction of Francesco Squarcione. At the age of 17 he withdrew from the purpose, and soon afterward the four evangelists for the church of St. Sophia at Padua. The works and reputation of the young artist induced the painter Jacopo Bellini to give him his daughter, Niccolia, in marriage. His frescoes in the church degli Eremitani, representing the life of St. James and the legend of St. Christopher, and his St. Mark in the church of St. Giustina, were among his next works in Padua. He was invited about 1485 by Ludovico Gonzaga to Mantua. Between 1485 and 1480 he visited Rome at the invitation of Innocent VIII., and painted with almost miniature-like delicacy a series of frescoes in a chapel in the Belvedere, all of which however perished when Pius VI. destroyed the chapel toward the close of the last century to make room for his new museum. Of his works extant, the principal is the celebrated series representing in nine compartments the triumph of Julius Caesar after his conquest of Gaul, originally painted for Ludovico Gonzaga, and which upon the downfall of that family were purchased by Charles I. of England. They were sold by parliament with the rest of Charles's pictures, but were repurchased on the return of Charles II., and placed in Hampton court. They were engraved by the painter, and were copied in chiaro oscuro by Andrea Andreani. Of his easel pictures the most famous is the Madonna della Vittoria, now in the Louvre, painted in commemoration of the victory gained by Gonzaga over Charles VIII. of France in 1495. Many other pictures by him are to be found in Italy and the large galleries of central Europe. Mantegna, according to Lanzi, engraved upward of 50 of his own designs, of which about 30 are known to collectors.

MANTELL, Odeon Algeron, an English geologist, born in Lewes, Sussex, in 1790, died in London, Nov. 10, 1852. He was educated as a surgeon, and attained a lucrative practice in his native town. Inclination, however, led him to devote much time to geological researches, and in a few years his discoveries in the Wealden formation, the extraordinary fos siliferous richness of which had been previously little known, gave him a high rank among living paleontologists. To his labors science is indebted for the discovery of four out of five of the genera of extinct dinosaurian reptiles, viz.: the iguanodon, the hypeurosaurus, the pelorosaurus, and the regnosaurus; and his valuable museum collected from the Wealden and chalk formations, and which was purchased in 1839 for £5,000 by the trustees of the British museum, contains well preserved fossils of these, and also of many extinct fishes, insects, and plants. His geological drawings were bequeathed to Yale college, from which institution he received the degree of LL. D. in 1844. In 1825 he was elected a member of the royal society; in 1855 he received the Wollaston medal of the geological society, and in 1849 the royal medal of the royal society. In 1859 he removed to America, where he continued his medical practice and geological researches, and was remarkably successful as a lecturer. His chief scientific work separately published is "Fossils of the South Downs, or Illustrations of the Geology of Sussex" (4to, London, 1822). He is also the author of two popular treatises of great merit, "The Wonders of Geology" (2 vols., London, 1888), and "The Medals of Creation, or First Lessons in Geology" (2 vols., 1844), both of which have been translated into German, and of a number of other works illustrating the geology of the British isles and his own discoveries, including a "Pictorial Atlas of Fossil Remains" (4to, 1850). In Agassiz and Strickland's Bibliographia Zoologia et Geologia, 67 works and memoirs by Dr. Mantell are cited, besides which he wrote several papers on antiquarian and professional subjects.

MANTEUFFEL. L. Otto Theodor, baron, a Prussian statesman, born at Lübben, Feb. 3, 1805. He entered the civil service at an early age. In 1844 he was made a member of the council of state, and in 1847, in the first united diet, he was conspicuous as an ultra conservative.
During the administration of Count Brandenburg (1848–50) he was minister of the interior. Upon the death of the count he was appointed minister of foreign affairs, and soon after, at the conference of Olmütz (November, 1850), brought about a settlement of the disputes between Austria and Prussia, by abandoning the position previously assumed by his state in North Germany. In December following he was appointed prime minister, still retaining his place as the head of the department of foreign affairs. In January, 1852, he became president of the council of state, and in 1858 was superseded and retired to private life. H. Karl Rochus Edwin, baron, a Prussian soldier, cousin of the preceding, born in Magdeburg, Feb. 24, 1809. He became aide-de-camp to the king in 1848, and rose to the rank of adjutant general, lieutenant general, and chief of the military cabinet. In 1865–6 he became conspicuous as military and civil governor of Schleswig, by the invasion of Holstein, by his operations against Hanover, and by his vigorous proceedings against the city of Frankfort. In the Franco-German war he commanded the first Prussian army corps before Metz, and on the capitulation of Bazaine (Oct. 27, 1870) he commanded the first German army against the French army of the North, capturing Amiens, Rouen, and Dieppe. In January, 1871, he was placed in command of the South German troops operating against the French army of the East under Bourbaki, and afterward under Clichy, which he drove across the Swiss frontier, thus ending the war. In June, 1871, he was appointed commander-in-chief of the German army of occupation, his headquarters being at first at Compiègne, and afterward at Nancy, where he remained until the final evacuation of the French territory in 1873. He has received the rank of field marshal.—See Aus dem Leben des General-Feldmarschalls Edwin Freiherrn von Manteuffel (Berlin, 1874).

MANTINEA, one of the oldest and most powerful towns of Arcadia, on the borders of Argolis and the river Ophis. Its democratic political constitution was, according to Polybius, one of the best in antiquity. Like the other Arcadian towns, it acknowledged the Spartan supremacy prior to and during the Persian war. It was an ally of Sparta in the early part of the Peloponnesian war, but in 421–20 B. C. formed a confederacy with Argos, Elis, and Athens, which was defeated and dissolved by the Lacedaemonians in 418. Though it became again an ally of Sparta, its increasing power rendered it obnoxious to the latter city, and in 385 the Spartans attacked and destroyed it by turning the waters of the Ophis against its walls. The Mantineans rebuilt their city after the overthrow of the Spartan supremacy by the battle of Leuctra in 371. They were prominent in the formation of the Arcadian confederacy, but soon abandoned it for an alliance with their ancient enemies the Spartans. To prevent this coalition Epaminondas marched into the Peloponnesus, and Mantinea is chiefly celebrated as the scene of the great battle (362) between the Thebans and Spartans, in which he fell. It continued one of the most important towns of Arcadia till the time of the Achaean league, which it at first joined, but subsequently deserted for the Aetolian confederacy, an event which occasioned the Cleomenic war. In 226 it was surprised and terribly chastised by Aratus, and in 222 it was plundered by Antigonus Doson, and its name changed to Antigonea, which it bore till its ancient appellation was restored by the emperor Hadrian. The ruins of Mantinea are visible at the modern village of Paleopolis, in a bare plain, 8 m. N. of Tripolis; they consist of the remains of the theatre and three courses of masonry of the entire circuit of the walls, which were elliptical, 1,250 yards in diameter, with 10 gates and 118 towers.

MANTIS (Fabr.; Gr. μαντίς, a soothsayer), a genus of orthopterous insects of the group of graspers (raptoria). In the best known species, M. religiosa (Linn.), the head is triangular, the eyes large, the prothorax very long, and the body narrowed and lengthened; the anterior feet are armed with hooks and spines, and the tarsi are capable of being doubled up on the under side of the thighs. When at rest it sits upon the four posterior legs, with the head and prothorax nearly erect, and the anterior feet folded backward in a singular attitude it is called the praying mantis or soothsayer (the prie-Dieu of the French). The insects are slow in their motions, waiting on the branches of trees and shrubs for some insect to pass within their reach, when they seize and hold it with the anterior feet, and tear it to pieces. They are voracious, sometimes preying upon each other; they are beneficial to man in destroying caterpillars and other insects injurious to vegetation. The eggs are deposited in two long rows, protected by a parchment-like envelope, and attached to the stalk of a plant; the nymph is as voracious as the perfect insect, from which it differs principally in the less developed wings. They are most abundant in the tropical regions of Africa, South America, and India, but are found in the warmer parts of North America, Europe, and Australia. In the south of France it was once a popular belief that this insect, if spoken to, would point out the way to a lost child, and in central and south Africa it is still regarded with veneration. The American species is the M. Carolina.
MANTUA (Ital. Mantova). I. A N. province of Italy, formerly included in Lombardy, but lately attached to Venetia, bordering on Brescia, Verona, Rovigo, Modena, Reggio, Parma, and Cremona; area, 855 sq. m.; pop. in 1872, 288,942. It is an extensive plain, in many parts swampy and insalubrious, but has been much improved by draining, and is generally very fertile. It is watered by the river Po and its affluents the Mincio and Oglio, and its principal products are grain, flax, hemp, rice, fruits, and wine. The province is divided into the districts of Gonzaga, Mantua, Ostiglia, Rovigo, and Sermonde, and embraces the former duchy of Mantua. II. A city, capital of the province, 80 m. E. S. E. of Milan and 29 m. S. S. W. of Verona, on an island in the middle of a lagoon formed by the Mincio; pop. in 1872, 26,687. The swamps and marshes surrounding Mantua, in connection with the formidable works which guard all its approaches and enclose it on every side, once constituted its most important defences, and made it so strong that it was deemed impregnable by any means but famine; but of late years the marshes have been partially drained and diked, and the salubrity of the city is greatly improved. The communication between the island and the mainland is by several bridges, the longest of which, the ponte di San Giorgio, forms the principal approach to the city. The latter is entered by five gates, one of which, the porta Malina, presents a curious specimen of ancient engineering. Mantua has a desolate appearance, except in the central parts, where there is commercial activity; but it contains many fine streets, the via Larga being the widest avenue. Among the finest squares are the piazza di Virgilio, sur-

Mantua.
(Virgiliana), now chiefly used as a school of drawing, a chamber of commerce and industry, a monte di pietà, a general house of correction, a military arsenal, a theatre, and an elegant amphitheatre. The manufactures, including silk, linen, sail cloth, woollens, soap, paper, and parchment, are limited, and the principal article of trade is silk.—Mantua is supposed to have been founded by the Etruscans 400 years before the building of Rome, and it came under Roman power in 197 B.C. It derives its chief classical celebrity from associations with Virgil, who has celebrated Mantua as the place of his birth in several passages of his works. Charlemagne gave it its first fortifications, which in modern times were completed in their present form by the Austrians. In the middle ages it was one of the most important cities in Italy, and was greatly improved and embellished by the Gonzaga family, under whom it became with the surrounding territory a duchy.

(See GONZAGA.) In 1630 it was seized by the imperialists and subjected to terrible calamities, from which the city has never recovered. In 1796-7 Bonaparte, hopeless of reducing the fortress by force of arms, kept it under strict blockade for five months till famine compelled it to capitulate, Feb. 2, 1797. The Austrians regained it in July, 1799, and the French again, after Marengo, in 1800. It belonged to the kingdom of Italy till 1814, when it was restored to Austria. In July, 1842, the Jews, who formed a considerable portion of the population, were confined in a separate quarter (ghetto), were subjected to great persecutions. In the war of Sardinia with Austria in 1848, the victory depended on the possession of Mantua; it was blockaded for several months by the troops of Charles Albert, till his defeat by Marshal Radetzky in the battle of Custozza (July 25). During the wars of 1859 and 1866 Mantua was again of high strategic importance, as one of the most formidable strongholds of Austria. By the treaty of Vienna, July 11, 1859, it was excepted from the territory ceded to the king of Sardinia; but it was annexed to Italy Oct. 11, 1866.

MANUEL, the name of two Byzantine emperors. I. MANUEL I. COMNENUS, born about 1120, died Sept. 24, 1180. The valor which he had displayed against the Turks induced his father John II. (Caco-Joannes) to bequeath the crown to him rather than to his elder brother Isaac, and he succeeded him in 1143. He was at once involved in wars both in the East and the West, which lasted with brief intermissions through his reign. In 1144 he subjected Raymond, the Latin prince of Antioch. In 1145 he defeated the sultan of Iconium in successive pitched battles. In 1147 he promised his aid to the new crusade headed by Louis VII. of France and Conrad III. of Germany; and he allowed them a passage through his dominions, but gave them secret information to the Turks. In 1148 he began the most important war of his reign with Roger, the Norman king of Sicily, who had taken Corfu and prepared to invade Greece. He formed an alliance with the Venetians, who within a year joined him before the fortress of Corfu, which was surrendered after an obstinate siege. He was prevented from invading Italy by hostilities of the Serbians and Hungarians, instigated by Roger, the former of whom were vanquished in two campaigns, but the latter protracted the war till 1152. In that year he suffered a reverse from the Turks in Cilicia, but his general John Ducas gained so great successes in southern Italy that Manuel conceived the project of reuniting the eastern and western empires. The defeat of Alexis, the successor of John Ducas, by William, the successor of Roger, soon followed; the Sicilian admirals Mauis routed the Greek fleet off Negropont, and advanced toward Constantinople; and Manuel therefore accepted an honorable peace in 1155. Those Greek prisoners who were silk weavers were retained in Italy, and gave origin to the Italian silk manufactures. In the following years he waged successful wars with Raymond, prince of Antioch, and Az ed-Din, the Turkish sultan. A new war soon broke out with Gezza II., king of Hungary, which was terminated by the defeat of the Hungarians at the battle of Szepes. In 1176 he was defeated by Az ed-Din in the mountains of Pisidia, and was obliged to sign a disadvantageous peace. By breaking the treaty and renewing the war he obtained honorable terms. Depressed by this disastrous expedition, he never recovered his former military enterprise and ambition.

II. MANUEL II. PALAELOGUS, born in 1348, died July 21, 1425. At the death of his father John V. in 1391, he fled to Constantinople from the court of the sultan Bajazet, with whom he had been left as a hostage. The consequence was a war with Bajazet, in which Manuel was supported by an army of Hungarians, Germans, and French. The king and the French were defeated by the command of Sigismund, king of Hungary and after-war emperor of Germany, were defeated in the bloody battle of Nicopolis in 1396, with the loss of 10,000 men. Constantinople was besieged, and its fall seemed impending, when the conquests of Tamerlane diverted the arms of the sultan. Manuel visited Italy, France, England, and Germany, vainly seeking assistance from the western princes. In the conflict between the Tartars and the Turks, he acted with diplomatic skill, and secured peace to his empire. He sent ambassadors to the council of Constance with instructions to urge a union of the Latin and Greek churches; but his real object was only to obtain aid from the kingdoms of the West, and to alarm the Turks by the negotiations.

MANUMISSION, in Roman antiquity, the form by which slaves, or other persons not sui juris, were released from their condition. There were three modes of effecting a legal release, by vendita, census, or will, by any of which the freedman might obtain the rights of a citizen. The vendita was the oldest, and as
follows: The owner brought his slave before the magistrate, and stated the grounds on which he intended his manumission. The lictor laid a rod on the head of the slave, and declared him free by right of the Quirites; the master, who in the mean time held the slave, pronouncing the words, “I wish this man to be free,” turned him round, and let him go (emisit e manu, whence the term). The magistrate then declared him to be free. The manumission by census was effected by the slaves giving in their names at the lustral census at the bidding of their masters. By will a slave could be made free conditionally or unconditionally, or free and an heir to the testator. Laws at different periods enacted restrictions, such as limiting the proportion of slaves a man might manumit in his will and preventing manumission to defraud creditors. The act of manumission established the relation of patron and freedman between the manumitter and the manumitted; and if the former was a citizen, the latter became a member of his gens, and assumed his family as well as personal name, to which he added some other as surname, commonly that by which he was previously known.

MANURES. See Agricultural Chemistry, vol. i., p. 197.

MANUSCRIPT (Lat. manus scriptum, written with the hand), in bibliography, a written book or document, in distinction from a printed one. (For the various materials that have been used for this purpose, see Book, Paper, and Papyrus.) In form, ancient manuscripts were either rolls (volumina) or flat pages like our printed books (codices). The Egyptian papyri are usually in rolls of an indefinite length, according to the subject matter, but some of the smaller ones are flat. Leaves of parchment were sometimes interspersed with papyrus leaves to strengthen the latter. Parchment and vellum manuscripts also were originally in rolls, but codices were made as early as the 8th and 4th centuries. The pages of the latter are usually quarto, rarely folio or octavo. Some of the oldest are square, but they are generally a little higher than broad. The manuscripts of the Mexicans were sometimes in rolls, but more generally in book form, the paper, which was continuous, being folded like a chart, with a tablet or cover of wood at each end. As the writing was on one side only, each page could thus be referred to separately, as in a modern book.—The transcribing of manuscripts was committed by the Greeks and Romans principally to slaves, who were esteemed of great value when they excelled in the art. They are called by Horace scriptores librarii, and in later times antiquarii. Becker thinks that the latter term was applied, after the cursive writing came into use, to those who copied books in the old uncial characters. There were also at Rome professional copyists, some of whom were women. About the 5th century associations of scribes, who worked under stringent rules, were formed. In the middle ages copying was almost exclusively in the hands of ecclesiastics, who were called clerks (clerici). In all the principal monasteries a room called scriptorium was devoted to the scribae or scriptores, where they could pursue their work in quiet. The text was sometimes read aloud by a dictator. The manuscript when finished was corrected by one appointed for the purpose, and it then passed into the hands of the miniator, who added the ornamental capitals and other embellishments. The earliest form of illumination was the use of different colored inks. The Egyptian papyri are generally written in red and black, but some are ornamented with other colors and with gilding, and some with vignettes, many of which are remarkable for the delicacy and beauty of their execution. In the vellum manuscripts of the 4th and 5th centuries the initial letters, the first words, or the first three or four lines of books are often in red ink, while the body of the work is in black. Other colors, as purple, blue, green, and cinnamon, were used early, and sometimes the entire manuscript was written in gold or silver letters on purple, blue, or rose-colored parchment. One of the most interesting examples of this is the Argenteus Codex in the library of the university of Upsala, written in silver letters, with the initials in gold, on violet-colored vellum. (See Argenteus Codex.) The Codex Aureus of the royal library at Stockholm is a Latin manuscript of the Gospels, written in Gothic characters of gold on leaves of vellum alternately white and violet; it belongs to the 6th century. In the earlier Greek and Latin manuscripts there was no distinction of initial letters, but after the 4th century the first letters of books and chapters, and sometimes of each page, were made larger than the body of the letters, and were frequently profusely ornamented in design and color. In the 6th and 7th centuries initial letters were one or two inches high, and from the 7th to the 10th century were often a foot high, covering nearly the whole page. The Irish manuscripts of this period exhibit some of the most extraordinary work of this kind, the initials being formed of complicated interlaced patterns, and ornamented with figures of men, birds, animals, and grotesque deformities. One of the finest specimens of this class is the copy of the Gospels known as the Book of Kells, in the library of Trinity college, Dublin; it dates from the 7th century. The early Franco-Galic manuscripts show a distinct style of illumination of initial letters in arabesque patterns with elegant foliage. In the middle ages colored and gilded designs and illustrations were so common that it was said: Hodie scriptores non sunt scriptores, sed pictores. Miniatures and pictures were early introduced into manuscripts. Pliny says that physicians painted representations of medicinal plants in their treatises, and that Varro illustrated his biography of
emanent persons with 700 portraits. In the imperial library at Vienna is a Roman calendar with allegorical figures of the months, supposed to have been executed in the first half of the 4th century; and in the same library is a copy of Dioscorides, dating from the beginning of the 6th century, containing numerous miniatures and illustrations of plants. There is also a fragment of a Virgil of the 4th century in the Vatican library, which is profusely ornamented with miniatures. The Codex Cottiananus Genesios, the remains of which are in the British museum, had originally 250 miniatures, each about four inches square. This manuscript, which contained fragments of the Old and the New Testament in 165 quarto leaves, is said by tradition to have belonged to Origen in the first half of the 4th century, but it is now ascribed to the 6th century. It was almost entirely destroyed at the burning of the Cottian library in 1731. In the Ambrosian library in Milan is a part of a very ancient copy of the Iliad illustrated with miniatures. The Persians, Hindoos, Chinese, and other eastern nations illuminated their manuscripts, but no very ancient specimens are known to be extant. Some of the Arab manuscripts are remarkable for the beauty of their arabesque ornamentation, and for the absence of any representations of living figures, the painting of which is forbidden by the Koran.

The most ancient manuscripts extant are the papyrus rolls from the tombs of Egypt, where the dryness of the climate and of the sand beneath which they were buried preserved them in an almost perfect condition for thousands of years. They may be considered under two general heads, the Egyptian proper and the Greek. Of the former three classes are found, written respectively in the hieroglyphic, the hieratic, and the demotic or enchorial characters. The first was mostly composed of a religious and moral character, the most common one being the ritual of the dead. Hieratic manuscripts contain the great body of Egyptian literature. One of the oldest known is the Prisn papyrus in the national library at Paris, a moral treatise written by Prince Ptah-hotep of the 5th dynasty, the beginning of which is placed by Mariette at 3951 B. C. Manuscripts in the demotic character, consisting principally of contracts, bills of sale, accounts, letters, &c., are found dating from the beginning of the 9th century B. C. to about the 2nd century A. D. (See Egypt, Language and Literature of.) The Greek papyrus manuscripts found in Egypt are of two classes: books proper, written in uncial letters, and public and private documents, in cursive characters. Among the oldest specimens of the first class extant are fragments of a treatise on rhetoric and a part of the 13th book of the Iliad, written in the 3rd century B. C., in the national library at Paris; and among the papyri recovered from Heracleum is a fragment of a treatise on music by Philodemus, of the 1st century B. C. Among the oldest cursive manuscripts is a petition to Ptolemy Philometor, written in the 2d century B. C., also in Parchment, invention of parchment is usually ascribed to the reign of Eumenes II., king of Pergamus, in the 2d century B. C., but manuscript rolls of brown leather of the 14th dynasty have been found in the Egyptian tombs, and rolls of white parchment made more than 1,000 years before Eumenes are preserved in the British museum. A recently discovered leather manuscript of the ritual of the dead, written in black and red hieratic characters, is now in the Berlin museum. It is ascribed to the 18th dynasty. Of parchment manuscripts made since the beginning of the Christian era, probably the most ancient one in existence is the palimpsest of Cicero's De Republica in the Vatican library, supposed by its discoverer, Cardinal Mai, to have been written in the 2d or 3d century. (See Palimpsest.) It contains 802 pages, and is written in double columns of 15 lines each, in fine Roman uncials, with no division of words. Over it is St. Augustine's commentary on the Psalms. In the library of Verona is a palimpsest Virgil of the 3d or 4th century, with the Gregorian commentary on Job written over it in a script of the 8th century. The same library possesses the celebrated palimpsest of the 4th century, containing the greater part of the Institutes of Gains, overwritten with a copy of the letters of St. Jerome. A palimpsest in the British museum contains, under fragments of the sermons of St. Chrysostom, written in Syriac, the only extant portion of the annals of Liciananus, in uncial characters of the 4th century. In the Vatican are a Terence of the 4th or 5th century and a fragment of a Salust of the 5th. The Laurentian library of Florence possesses the celebrated Medicinae Virgil, the most perfect of the ancient copies extant, which contains only a part of the 2d century. It contains 440 leaves, is written on both sides, and the first three lines of each book are in vermilion. It belongs to the 4th or 5th century. — No authentic manuscripts or fragments of manuscripts of the Bible of the first three centuries are known to exist. The Codex Sinaiticus, which was obtained by Tischendorf in 1859 from the convent of St. Catharine on Mt. Sinai, and is now in the imperial library at St. Petersburg, is generally conceded to have been written about the middle of the 4th century. Tischendorf considers it not improbable that it is one of the 50 copies of the Scriptures which the emperor Constantine in the year 331 directed to be made for Byzantium, under the care of Eusebius of Csesarea. It consists of 345½ leaves of very fine vellum, made probably from the skins of antelopes or of asses, each leaf being 14½ inches high by 13½ inches wide. The writing on each page is in four columns (excepting in the poetical books of the Old Testament, where there are but two), each containing 48 lines of 12

5th cent. Cod. Ephraemi. 1 Tim. iii. 15–16.

ομα της αληθειας | Και ομολογουμενω μεγα οτι εστιν το της ενεσθειας μου | 'στοριον' θεος οφειρωθη εν σαρκι εικασθη εν πνευμα τινα.
to 14 letters each. The characters are well executed uncials, unconnected with each other, without spaces between the words, with no large initial letters, no breathings nor accents, and with few marks of punctuation. The first line of each of the psalms and of the other poetical books is in red ink. It contains both the Old and the New Testament, the latter perfect. The Codex Vaticanus, a manuscript of the Greek Bible, deficient in some parts of the New Testament, is also ascribed to about the middle of the 4th century, although Tischendorf considers the evidence not quite so conclusive as in the case of the Sinaiticus. Its early history is not known, but it appears in the first catalogue of the Vatican library in 1475. It is a quarto volume, 10½ inches high, 10 broad, and 4⅛ thick, and is bound in red morocco; contains 146 leaves of fine thin vellum, has three columns of 42 lines each to the page, and is written in elegant uncials, somewhat smaller than those of the Sinaiticus, with no spaces between the words. As originally written, it had no large capital letters and no breathings nor accents; but capital letters in blue or red, three fourths of an inch high, have been added at the beginning of each book by a later corrector, who also put in the breathings and accents, and probably the stops. Of the Biblical manuscripts of the 5th century, the Codex Alexandrinus of the British museum, containing nearly the whole of the Greek Bible, is the most important. It is in four quarto volumes, with pages 13 inches high by 10 broad, has two columns of 50 lines each to the page, and is written in uniform uncials, with the first three or four lines of each book in red letters. It differs from the Sinaiticus and the Vaticanus in having large initial letters. Scholars are generally agreed in ascribing it to the middle of the 5th century. (See Alexandrian Codex.) Of the same century is the Ephraem palimpsest of the national library in Paris. It is about the size of the Codex Alexandrinus, though not quite so high, and has 209 leaves, of which 64 contain fragments of the Septuagint and 145 various parts of the New Testament. The original text, which was partly erased in the 12th century to make room for the writings of Ephraem Syrus, is in elegant uncials, without division of words or chapters, and with but one column to the page, consisting of from 40 to 46 lines. The Codex Beza or Cantabrigiensis, in the library of the university of Cambridge, belongs to the 6th century. It is a Greek manuscript, with a Latin translation on the opposite pages, of the four Gospels and Acts, with a number of pages missing. It is a quarto volume of 414 leaves, with pages 10 inches high by 8 wide, and written stichometrically in a single column of 33 lines to the page. The first three lines of each book are in red ink. The characters are uncials, and the words are undivided. (See Beza's Codex.) Among the fragments of manuscripts of this century, one of the most interesting is the Codex Purpureus, four leaves of which are in the British museum, six in the Vatican, and two in the imperial library at Vienna. Tischendorf found 33 additional leaves in the island of Patmos. It is written in silver letters, now quite black from age (the names of God and Christ in gold), on very thin purple vellum, and has two columns of 16 lines each to the page. The characters are large Greek uncials, written without division of words. Among the oldest and most important of the cursive Greek manuscripts of the New Testament is the Codex Basilensis, in the library of Basel, ascribed to the 10th century. It has one column of 33 lines to each page, and is written in small elegant characters, with breathings, accents, iota subscripts, and a few illuminations, among which are portraits of the emperor Leo the Philosopher and his son Constantine Porphyrogenitus. The Codex Ruber, a cursive manuscript containing fragments of the New Testament, in the national library at Paris, is written entirely in red ink; it belongs to the 10th or 11th century. Of the manuscripts of the Latin Bible, the Codex Amiatinus, in the Laurentian library at Florence, is the most important. It derives its name from the Cistercian monastery of Monte Amiato, in Tuscany, where it was owned previous to its acquisition by the Laurentian library. From intrinsic evidence it is supposed to have been written about 541 by Servandus, abbot of the Benedictine monastery near Alatri, on the borders of Latium. It consists of 1,029 leaves, of which 796 are devoted to the Old Testament and 232 to the New. It is written in well formed Roman uncials, and has two columns to the page, each having in general 43 lines stichometrically arranged. The first line of each book is rubricated. Other renowned manuscripts of the same century are a Virgil in the Vatican, a Prudentius, the sermons of St. Augustine on papyrus, the psalter of St. Germain-des-Près in silver letters, and a copy of the Theodosian code, all in the national library at Paris; the unique copy of the fifth decade of Livy, in the imperial library at Vienna; a Lactantius and the breviary of Alaric at Bologna; and a palimpsest containing 4,000 lines of the Iliad in the British museum. The celebrated manuscript of the Digest of Justinian too, in the Laurentian library at Florence, belongs probably to the close of the 6th century. —The science of reading and judging ancient manuscripts is called diplomatics, and is a branch of palaeography. In examining a manuscript in order to judge of its antiquity, it is necessary to consider the quality and character of the material on which it is written; the style of the writing; the inks used; its miniatures, vignettes, and arabesques, and the colors with which they are executed; the cover, its material and ornamentation; and the character of the contents. The oldest Greek and Latin manuscripts are written in square capital letters, without division of words or
sentences, and without punctuation. This style was in use until about the 6th century, when it was superseded by uncial writing, which had coexisted with it from the 3d century. A kind of capitals called rustics, having the letters slightly inclined, were used however until a much later time. Uncials differ from pure capitals in having some of the letters, particularly A, D, E, and M, curved. The most of the extant Greek and Latin manuscripts written between the 4th and 6th centuries are in uncial characters; but from the 6th to the close of the 8th century semi-uncial writing, a mixture of small and capital letters, came gradually into use, and led eventually to the small cursive or minuscule writing of the 10th century. These remarks apply more particularly to book manuscripts, for Greek cursives were used in letters and documents before the Christian era. Latin cursives were introduced into book manuscripts as early as the 4th century. In the oldest manuscripts the characters are written separately each from another, and there are no divisions into words or sentences, nor distinction of initial letters. Abbreviations early came into use. At first they were limited to principal words, such as names of the Deity; but in time, particularly in the 12th and 13th centuries, they became so common as to render many manuscripts almost unintelligible. Many of these abbreviations are arbitrary signs derived from the so-called Nota Tironiana, or Roman system of shorthand, ascribed by some to the invention of Tiro, the freedman of Cicero. A line is generally drawn above each abbreviated word to denote contraction. When the period or dot came into use, it was placed generally above, not in the line; the comma was introduced about the close of the 10th century, and marks of interrogation and exclamation and parentheses about the 15th century. The repetition at the foot of each page of the first word of the following page belongs to the 12th and subsequent centuries. The Arabic numerals first appear in writing near the beginning of the 12th century.—The most important works on manuscripts and paleography are: Mabillon, De Re Diplomatiae (Paris, 1681); Montfaucon, Palæographia Graeca (Paris, 1708), and Bibliotheca Bibliothecarum Manuscriptorum Nova (2 vols., 1739); Maffei, Istoria diplomatica, &c. (Mantua, 1727); Baring, Clavis Diplomatica (Hanover, 1737-54); Toussaint and Tassin, Nouveau traité de diplomatique, par deux religieuse bénédictins, &c. (6 vols. 4to, Paris, 1750-65); Vaines, Dictionnaire raisonné de diplomatique (2 vols. 8vo, Paris, 1773-74); Astle, "Origin and Progress of Writing" (London, 1784); Kopp, Palæographica Critica (4 vols., Mannheim, 1817-29); Ehret, Zur Handschriftenkunde (2 vols., Leipzig, 1825-27); Wailly, Éléments de paléographie (2 vols. 4to, Paris, 1838); Silvestre, Palæographie universelle, facsimiles, with descriptions by Champollion-Figeac and Aimé Champollion (4 vols. fol., Paris, 1839-45); Marini, Diplomatica pontificia (Rome, 1841); Westwood, Palæographia Sacra Pictoria (London, 1845); Chassant, Dictionnaire des abréviations latines et françaises usitées dans les manuscrits...du moyen âge (Évreux, 1844; 3d ed., Paris, 1866); and Wattenbach, Anleitung zur griechischen Palæographie (Leipsic, 1867).
produced a treatise on Latin orthography, *Orthographia Ratio*, founded on inscriptions, medals, and manuscripts. Notwithstanding these evidences of precocity, his mental capacity and attainments were inferior to those of his father or grandfather; and in consequence of his neglect to employ competent persons, his publications are the least valuable of all emanating from the Aldine press. He resigned his press in 1584 to one of his workmen, and during the remainder of his life was professor of belles-lettres successively in Bologna, Pisa, and Rome. He published works in Latin and Italian, besides commentaries on Horace, Cicero, &c. (See *ALDESE EDITIONS*.)

**MANZONI, Alessandro**, count, an Italian novelist, born in Milan, March 8, 1784, died there, May 22, 1837. His father possessed little cultivation; his mother was a daughter of the distinguished philosophical economist Beccaria. He studied first at Milan and afterward at Pavia, where he was an enthusiast for Alfieri, Monti, and Foscolo. In 1805 he went with his mother to Paris. The sudden death of a friend furnished the subject of his first poem, in blank verse, entitled *La morte di Carlo Imbonati* (Paris, 1806). Returning to Milan in 1807, he married in the following year the daughter of a banker of Geneva, and published in 1809 his mythological poem *Urania*. His education and residence in Paris had led him to imbibe skeptical opinions, and his wife belonged to the Calvinistic church; but both became devout Roman Catholics. The change was announced by his *Inni sacri* (Milan, 1810), a collection of religious lyrics. In 1820 appeared his romantic tragedy *Il conte di Carmagnola*, dedicated to Fenrili, which violated the mities of time and place, but was remarkable for its simplicity of plot and purity of style. It attracted attention throughout Europe, was severely criticised, was admired by Goethe, and was defended by the author in a letter written in French *Sur l'unité de temps et de lieu*. It was followed in 1823 by another tragedy, *Adelchi*; and on occasion of the death of Napoleon, he published an ode, *Il cinque Maggio* (1821), one of the finest modern Italian lyrics, in which he highly extolled the emperor. His greatest success was achieved by the novel *I promessi sposi* (8 vols., 1827), a Milanese story of the 17th century, which was translated into the principal languages of Europe, and was republished in America under the title of *The Betrothed Lovers*. In an illustrated edition (1842), he added to the original text a *Storia della colonna infame*, in which he gives an account of the executions caused by the popular superstition during the plague of 1630, and touches upon some of the highest questions of social economy. In 1854 he wrote *Osservazioni sul manifesto cattolico* (Florence), in reply to Sismondi's depreciation of the moral influence of the Catholic church in the middle ages; it was translated into English (London, 1866). He married a second time in 1833, and was afflicted by the death of all his children (including a daughter married to Massimo d'Azeglio), the last dying a few weeks before him. In February, 1860, he was named senator of Italy. His 80th birthday was celebrated with much enthusiasm by his countrymen in 1864. In 1868, with R. Bonghi, he prepared a report on the means of establishing the unity of the Italian language on the basis of the Florentine dialect. Almost to the day of his death he was engaged in the preparation of a *History of the French Revolution*. At his funeral the highest honors were paid to his memory, and the royal princes were among, his pallbearers. The chapter of the Prussian order *pour le mérite* which had been conferred upon Manzoni was in 1874 given to Carlyle.

**MAORI**. See *NEW ZEALAND*.

**MAP** (Lat. *mappa*), a representation of a portion of the earth's surface, or of the celestial sphere, upon a plane. Its object is to present to the eye the bearings of objects upon the surface from each other, and their relative distances apart, as nearly correct as may be. But this can be done with accuracy only upon a globe, the surface of which is similar to that of the earth itself. Various plans, however, have been devised by which in the more convenient form of plane sheets true delineations of the surface are presented, reference being had to the principles upon which these maps are constructed. By the method called projection, the rules of perspective are applied to the delineation of objects upon the surface according to four principal modes. In the method of projection called orthographic, the eye is supposed to be at an infinite distance from the sphere, so that the rays of light coming from every point of the hemisphere opposite to it may be considered as parallel to one another. The sphere is intersected through its centre by a plane perpendicular to these rays, and it is upon this plane that the objects are projected, as their shadows might be cast upon it from the sun through a transparent medium. Objects near the centre of the plane would by this method be delineated in nearly correct proportions; but in receding from this, as the rays strike more obliquely upon the surface of the sphere, their projection becomes more and more distorted, and the parallels of latitude or meridians of longitude (as the eye is placed opposite the pole or the equator) are drawn more and more closely together. — In the stereographic projection, the eye is supposed to be placed at the surface of the sphere, and the surface to be delineated is the opposite hemisphere or a portion of it, of which the inner or concave side is presented to the eye. The plane upon which the objects are projected is supposed to be transparent, and placed as to pass through the centre of the earth, its surface perpendicular to the line passing from the eye to the centre. In this method the meridians and parallels intersect each other as they do upon the globe; and though there is
distortion increasing from the centre, it is less than by some of the other methods. The stereographic method is much used for the maps of the world drawn in two hemispheres; and the meridian of 20° W. from Greenwich is usually selected for the plane of projection, because this throws the two great continental divisions of the earth into their respective hemispheres.—In the central or gnomic projection, the eye is supposed to be at the centre of the earth, and the objects upon the surface are projected upon a plane which is a tangent to its surface. This method is obviously applicable to maps of a limited extent only; and except for maps of the polar regions, where the parallels of latitude are concentric circles, and the meridians are straight lines, they are troublesome to execute on account of the irregular curves the parallels assume.—In the globular projection, the eye is supposed to be at a distance from the sphere equal to the sine of 45°; or, the diameter being 200, this distance is 70-7. In order, however, that the meridians may intersect the equator at equal distances, the distance for the eye is generally fixed at 594, the diameter being 200. Maps are also constructed in which the meridians are represented by arcs of circles cutting the equatorial diameter at equal distances, and the parallels by arcs of circles cutting the polar diameter at equal distances. These maps are not projections, and founded upon no geometrical principle which can be of service in their use; nevertheless, they give a very good representation of the forms and relations of areas, and are of very simple construction. They are called globular maps, but must not be confounded with maps constructed upon the principle of globular projection, mentioned above. Another method of map making is based upon the principle called development, which is a mode of projecting the forms upon the surface of the earth upon the inner surface of a cone or of a cylinder, which is supposed to envelop the earth and touch it only around the circle which is to be the middle latitude of the map. The points on the earth's surface being projected by other lines drawn through them from the centre, the inner surface of the cone or cylinder is afterward supposed to be unrolled or developed, and thus present the various objects upon a plane surface. Those situated nearest the middle latitude will be most correctly represented. In the use of the cylinder the latitude circles and meridians appear as parallel straight lines, and thus most correctly represent for nautical purposes the angles at which they are cut by objects moving over the surface on any other lines. This principle is in part the foundation of the projecting known as Mercator's, and applied by him to charts for navigators, which the correct bearings of objects upon the surface are of more importance to determine than the true figures of countries. Still other principles are employed in constructing maps, according to the special purposes for which they are designed. In maps of small areas, the figure of the earth may be neglected, and the positions and forms of bodies be represented as if the surface were itself a plane. Some have special objects in view, as the delineation of the coast lines, channels, shoals, reefs, lighthouses, &c., hence called hydrographic maps or charts; others are intended to show the political divisions of states, counties, and towns; and others, designated topographical maps, to represent the natural features of a country, as mountains, hills, rivers, plains, &c., for all of which certain conventional signs are adopted. Maps have also been constructed to represent the courses of the winds and of oceanic currents over the surface of the earth; to designate the position of the isothermal lines; to indicate the geological formations found in different regions; and others to indicate the flora and the fauna of different countries. In the construction of geographical maps covering large areas, the principal places are located according to their latitudes and longitudes, and the lines of coasts and of countries, roads, &c., are plotted from the most exact surveys that have been made. Those which have been conducted under government patronage have furnished the materials for the best maps, and these are constantly improving as new materials are collected. Of the United States, the most complete maps are those of the state of Massachusetts made by order of the legislature, of the coast survey under the general government, Whitney's survey map of California, and Clarence King's survey map of the 42d parallel. The great lakes, more especially on the Canadian side, have been surveyed and mapped with great accuracy by Lieut. Baehler of the royal army. Maps of the Spanish provinces in America have been made by the Spanish hydrographical depot in Madrid; and Brazil and other South American states have executed maps of their territories. The ancient Egyptians had some knowledge of maps, as Sesostris caused the territories he possessed and had conquered to be represented upon tablets for the instruction of his people; and the Israelites appear to have acquired the same knowledge, from the record, in Josh. xvii., 6, of a map of the country being ordered by that lawgiver. The first map of the world, as known to the ancients, is said to have been made by Anaximander the Milesian. Herodotus makes mention of maps constructed by the Persians in the time of Darius, and of one by Aristagoras of Miletus. Eratosthenes introduced the lines of latitude and longitude, and the use of these was established by Hipparchus upon a mathematical principle. Still, for want of exact surveys, and owing to the dependence of geographers upon the reports of travellers and their itinera-

ria pietra, or painted itineraries, the maps afterward made were extremely inaccurate. Even those of Strabo and Ptolemy, of which those of the latter were for centuries the chief
of a very varied character; and among the latter are a large portion of the existing romances of the brand table. The "Two Poems commonly attributed to Walter Mapes" were printed in London by the Camden society in 1841, and *De Nugis Curialium* in 1850.

**MAPIMI**, a desert in N. Mexico, extending from the great bend of the Rio Grande, in lat. 30°, southward to the vicinity of Parras, in lat. 25°-30°, and averaging 24 degrees in width. It embraces two thirds of the state of Coahuila and parts of Chihuauba and Durango, and consists chiefly of a vast basin called the Bolson, or pocket, bounded N. by the Sierra del Cármen, E. by a portion of the Sierra Madre, and W. by low ranges of mountains. From the mountains to the northeast the rivers Escendido, Alamos, and Nadadores take their rise, but in the central basin there is no water except the brackish lagoons called Jecoc, Agua Verde, Cayman, and El Muerto. Nomadic Apaches are the only inhabitants, but well preserved mummies have been found in caves near the S. border. There is rarely any vegetation. Meteoric iron and coal abound, and the precious metals are believed to exist. Only the S. portions, called the Canton de San Marcos, and the plains of La Paila and La Bandurria, have been explored with any care. The Kickapoo Indians established themselves in 1864 near the N. border of this desert, and remained there till 1873, when they were removed to their former reservation in the Indian territory. At the W. entrance to the Bolson is situated the mining town of Mapimi, with 5,000 inhabitants. The emperor Maximilian erected a department under this name, with limits differing from those of the desert.

**MAPLE**, the common name of trees of the genus *acer* (Celtic aec, hard), belonging to the natural order *sapindaceae*, of which with two other genera it forms the suborder *acerrine*. There are about 50 species, distributed in North America, Europe, northern Asia, Java, and the Himalayas; some are small shrubs and others large trees, frequently with a saccharine sap and rarely with a milky juice; the leaves are opposite, deciduous, simple, palmately three- to seven-lobed, rarely entire. The flowers are in axillary and terminal racemes and usually polygamio-dioecious; i.e., some have stamens only, others pistils only, or both organs may be in the same flower; the usually five-petaled calyx is colored and deciduous; petals wanting, or when present as many as the lobes of the calyx; stamens four to twelve, inserted upon a disk; pistil of two united ovaries with two styles; from the back of each ovary grows a wing converting the fruit into two one-seeded keys. Our North American species, of which there are about 10, differ in their time of flowering; in some the flowers appear long before the leaves, in others a month before the leaves; at the time the leaves unfold, and in others they do not appear until after the foliage is well developed. Our commonest species is the red
or swamp maple (A. rubrum); this and the next, the silver maple, flower in March and April, and perfect their seeds about the first of June; when the seeds fall, they germinate in a few days, and by the autumn of the same year form a young tree one or two feet high; this peculiarity must be observed by those who would raise these trees, as the seeds will not retain their vitality if kept until the following spring. The red maple is found in swamps and damp woods from Canada to the gulf of Mexico, and is also known as the soft, the swamp, and the white maple, which last name should be discarded, as it properly belongs to the next species; it is usually a small tree, though it sometimes reaches 60 or 70 ft., with a diameter of 2 or 3 ft.; the young twigs are red, and gradually change to a clear ashy gray. This is a conspicuous tree when in bloom in early spring, as its flowers are produced in such profusion as to make the tree appear at a distance as a mass of color, varying from crimson to scarlet; the individual trees differ much in shade, some being very pale, while others are exceedingly brilliant; the leaves vary greatly in size and shape, and the number and depth of the lobes. The trees with pistillate or perfect flowers produce a profusion of fruit, which makes them objectionable near a garden, as the seeds find their way to every nook and the young maples spring up as weeds. The beauty of our autumn landscape is largely due to the brilliant colors assumed by the foliage of the red maple; it presents every shade of orange, scarlet, and crimson, and these colors, together with green, are frequently to be found upon the same leaf. The wood is white with a tinge of rose color, fine, close, and smooth; it is used for a great variety of turned wood and for making the cheaper kind of furniture; it is a useful wood for any purpose if it is not to be exposed to dampness. Some of the trees, in which the fibres take a serpentine course, afford the handsome wood known as curled maple, valued for inside work and for gun stocks; other varieties are known as landscape and mountain maple. As a fuel, the wood of red maple ranks below that of the sugar or rock maple; it burns rapidly and does not last long. The bark is used in domestic dyeing, forming with iron salts a good black.—The white or silver maple (A. daisy-carpus) is more common in the western than in the eastern states, but it is more or less abundant along rivers from Maine to Georgia; as the red maple is often called white maple, the two trees are frequently confounded, but they are readily distinguished by the color of the young twigs, which in this species are green, while in the other they are red, and by the silvery whiteness of the under surface of the leaves, which has given one of its common names to this species. The leaves are usually five-lobed, with the lobes deeply and handsomely toothed; the flowers, which appear before the leaves, are greenish yellow; the fruit, the early ripening of which has been mentioned, is downy when young, but smooth when ripe; the two wings diverge widely and are about 2 in. long. The tree grows to about 50 or 60 ft. with very spreading limbs; specimens with a circumference of 12, 16, and 18 ft. are recorded, but the usual diameter is about 2 ft. On account of the wide spread of its branches and its fine foliage, this is much valued as a shade and ornamental tree; but as the wood has little strength, the branches are apt to be broken by gales and by accumulations of snow and ice. For planting in prairie countries no tree is more highly prized than this, as by its rapid growth it gives a quick return in valuable fuel. The wood is soft, white, and fine-grained, but it has little strength and is very perishable; hence its use as lumber is limited; as a fuel it is much esteemed.—The most valuable of all our species is the sugar or rock maple (A. saccharinum), which is most abundant north of lat. 40° and east of the Mississippi; in the southern states it is found only along the mountains. The tree when young is usually very symmetrical, and indeed somewhat too formal in its outline, but when old it assumes a great diversity of forms, which seem to depend upon soil and situation; it sometimes reaches 70 or 80 ft., but is usually much smaller. The leaves are broader than long, often heart-shaped at base, three- to five-lobed, with the sinuses or spaces between the lobes rounded, while in the two species above mentioned these are acute. The flowers, which appear with the leaves, are greenish yellow, in umbel-like clusters upon very slender hairy pedicels; the fruit, which has a broad wing, ripens in October, and if intended for sowing should be kept through the winter in damp sand. As an ornamental tree the sugar maple has been strangely neglected in this country; its growth is quite slow when young, and nur-
sermen prefer to produce more rapidly grow-
ingen trees; as a tree to plant in the streets of
towns and villages, and along country roads, it
great merit; but the least of its excel-
lent qualities is the great brilliancy of its au-
tumn colors. The wood is one of the most
valuable for fuel, ranking next to hickory, and
for charcoal it is esteemed above all others.
While the wood of some trees is perfectly
straight-grained, that in other specimens pre-
vents marked and often elegant varieties; the
curled hard maple presents a pleasing surface
of light and shade, and the bird's-eye maple has
its fibres so singularly contorted as to produce
numerous little knots which look like the eye
of a bird; these varieties and others are much
valued for cabinet work of various kinds and
interior finishing, while the straight-grained
wood is used for making lasts, buckets, tubs,
and a variety of other useful articles; it is also
employed in ship building. The sap of this
species contains cane sugar, a fact recognized
in its common and botanical names; other
maples, the birches, hickories, and some other
trees, yield sugar, but none of them in such
large quantities or in so pure a state as the
sugar maple. On many farms a maple orchard
or sugar bush, as it is called, is an important
part of the property, and yields a good share
of the yearly income. The trees are tapped
by boring near the ground, a tube, frequently
of elder, inserted, and a vessel is set or hung
to catch the sap as it trickles out; the flow
begins in early spring, often in February, and
is most abundant when there are warm days
and frosty nights. The process of making the
sugar is often very crude, and consists of
merely collecting the sap and boiling it down
in kettles over an open fire; when sufficiently
concentrated the syrup is poured into moulds
to granulate. Of late years much more care
is given to the manufacture of the sugar, and
a house is provided expressly for the purpose,
and furnished with improved evaporators and
other apparatus to facilitate the operation;
there is a large demand for maple syrup, and
some makers send all their sugar to market in
this form. According to the census of 1870,
the total production of maple sugar in the Uni-
ted States was 28,443,945 lbs., in 28 different
states, of which the following contributed the
largest amounts: New Hampshire, 1,800,704
lbs.; Vermont, 8,894,302; Massachusetts, 399,-
800; New York, 6,692,040; Pennsylvania,
1,545,917; Virginia and West Virginia, 755,-
699; Kentucky, 269,416; Ohio, 3,469,128;
Indiana, 1,332,332; Wisconsin, 507,192. The
total quantity of maple molasses or sirup re-
turned was 921,077 gallons. The black sugar
maple, which was described by Michaux as a
distinct species, is now regarded as only a
variety (var. nigrum) of the ordinary sugar
maple; the colorless, nearly deep-colored, and
the whole tree has a darker appearance; it is
said to be more productive of sugar.—The
striped maple or moosewood (A. Pennebyra-
nicenum) is a small and slender tree from 12 to
20 ft. high, found in rich woods from Maine
southward along the mountains; its branches and trunk become striped
with dark lines, giving a character by which the
tree is readily identified; the leaves are
three-lobed at the apex and doubly serrate;
the flowers, which do not appear until after
the leaves, are in terminal pendulous racemes,
and the cluster of fruit is quite conspicuous.
In the northern woods the young twigs of this
tree are browsed upon in winter by the moose.
The wood is regarded as more durable than
that of any other maple, but it is too small to
be of much value; it is said to reach three or
four times its ordinary size if grated upon the
larger species of maple. Its chief value is as
an ornamental tree; its ample leaves, which at
the time of opening are rose-colored, the striped
appearance of the trunk, and the conspicuous
flowers and fruit all commend it to the atten-
tion of the planter. The mountain maple (A.
epicotum), found in the same range as the
moosewood, is rather a tall shrub than a tree,
and forms clumps in moist woods; the three-
to five-lobed leaves are downy beneath, and
their very long petioles become scarlet in Sep-
tember; the flowers are in terminal, usually
erect racemes, and the fruit, which is smaller
than in any other of our native species, has
very divergent wings.—The large-leaved maple
(A. macrophyllum) of the Pacific coast is es-
pecially abundant in Oregon, associated with
the firs and spruces; it is a remarkably grace-
ful tree, from 40 to 90 ft. high, with widely
spreading branches and a rough brown bark;
it is very conspicuous on account of its very
large leaves, which are sometimes a foot broad,
though variable in size; they are deeply five-
lobed and rather thick; the flowers are in
large pendent racemes, yellow and fragrant,
and succeeded by clusters of hairy fruit with
smooth, slightly diverging wings. The wood
of this species is close-grained and hard, and
according to Nuttall handsomely veined; it is
much valued in Oregon as furnishing almost the
only hard wood obtainable in some parts of the
state; its sap is said to be abundant and saccha-
rine. This magnificent tree has been so little
planted in the Atlantic states that its hardness
cannot be considered as fairly tested. Another
far western species is the round-leaved maple
(A. circinatum), called in Oregon the vine ma-
ple on account of its manner of growth; in the
moist forests several stems spring from the
same root and arch over until the tops reach
the ground, where they take root and thus form
an almost impenetrable thicket; it sometimes
grows 20 or 30 ft. high, but has more the habit
of a shrub than of a tree. The leaves are heart-
shaped, seven- to nine-lobed, about the size of
those of the red maple; the flowers are pur-
plish, and the fruit is remarkably dioecious;
the wood is heavy and fine-grained, and valued for
making handles and other small articles. The
smooth maple (A. glabrum) of the Rocky moun-
tains is a small shrub with leaves resembling those of the common currant in size and shape; its foliage is variable, and one form has been described as a distinct species, *A. tripartitum*.—Among the exotic species cultivated in this country, the largest and finest is the sycamore maple (*A. pseudo-platanus*); it attains the height of 60 ft. or more, with wide-spreading branches; specimens in England have reached 100 ft. with a diameter of 6 to 9 ft.; its foliage resembles that of the sugar maple, but the leaves are much larger, somewhat downy beneath, and on long reddish petioles; the flowers are in long racemes, and the fruit has only moderately spreading wings; the wood is much esteemed in Europe for turners’ work and other uses. There are several varieties of this species, one of which has purple leaves, and another with leaves variegated with yellow. The tree does not well bear transplanting when large. The Norway maple (*A. pla-

\[\text{Common European Maple (Acer campestre).}\]

field maple (*A. campestre*), as seen in this country, is scarcely more than a bush, seldom above 10 or 15 ft. high; in the south of Europe it grows much larger; its heart-shaped leaves are 2 to 3 in. broad, and five-lobed; flowers in short erect clusters and wings of the fruit diverging horizontally; there are several named varieties which differ from the type in foliage; the wood makes excellent fuel, and when large enough is used for cabinet and other work. Its chief value with us is as a lawn tree; it makes a regular and formal growth, and when well developed and branching to the ground presents a dense mass of foliage as broad as it is high. The Canadian (*A. Creticum*), almost an evergreen, the Tartarian (*A. Tartarium*), the Montpellier (*A. Monspessulanum*), and the Cebichian ‘maple’ (*A. Colchicum*), and some others, are met with in collections of rare trees. A highly ornamental class of maples is found in Japan, several of which have been introduced into this country by Mr. Thomas Hogg; these include varieties of *A. palmatum*, *A. polymorphum*, and others of which the species are not determined; they present a great variety in the lobing and dissection of their leaves and the most exquisite variegations in color.—The ash-leaved maple, called *acer negundo* by Linnaeus and Michaux, is now placed in a separate genus, *negundo*, which differs from *acer* in having perfectly distinctive flowers and pinnate leaves. There are but three or four species of this genus, which is peculiar to North America and Japan. The common species is *N. aceroides*, which is found from the Red river of the North to North Carolina, but mainly westward, and is more abundant on the banks of streams than elsewhere. It is a rapid-growing tree when young, but is short-lived on dry soils; in favorable situations it becomes a fine tree 40 to 60 ft. high, but is usually much smaller; it forms a handsome round head with
MAQUET

dense foliage; its compound leaves have three or five leaflets, which are ovate, pointed, and toothed; the staminate flowers are in small clusters, and the pistillate ones in racemes, which later are several inches long and conspicuous on account of the numerous fruits, like those of the maple, with incurved wings. The wood is similar to that of the red maple, and useful for fuel. The abundant sap yields sugar, and it is by some regarded as purer than that afforded by the sugar maple. This tree is in the western states generally called box-elder, and is a favorite with those engaged in tree planting upon the prairies, a purpose for which its rapid growth well adapts it; and though not long-lived, it will furnish both fuel and sugar while slower but more valuable kinds are growing. It is much valued as an ornamental tree, its symmetrical growth and neat habit making it suitable for the lawn. A variegated form of this has been recently introduced, in

which the leaves are abundantly marked with white; a specimen of this seen against a background of evergreens produces a striking effect in landscape gardening.

MAQUET, Auguste, a French novelist, born in Paris in 1813. He studied and taught at the collège Charlemagne, and wrote for Alexandre Dumas parts of many works which the latter claimed exclusively as his own. In 1846, however, Maquet's pamphlet, La maison Alexandre Dumas et compagnie, forced Dumas to acknowledge his share in these productions; and in 1851 they dissolved their literary partnership. Maquet has published La belle Gabrielle (5 vols., 1859-55); Le comte de Lavernie (10 vols., 1855-59); La maison du baigneur (3 vols., 1856); L'evere et l'endroit (4 vols., 1859); and La rose blanche (3 vols., 1859). Among the novels ostensibly by Dumas, the best known of those in the writing of which Maquet had a considerable if not the principal share are Les trois mousquetaires, Vingt ans après, Le vicomte de Bragelonne, Monte Cristo, and Joseph Balsamo. He took the same share in dramatizing some of these novels, chiefly in conjunction with Dumas, but also with Jules Lacroix.

MARABOU, the popular name of several large birds of the stork family, of the genus leptopilinus (Lesson), natives of Asia and Africa, whose delicate vent feathers were formerly highly esteemed as ornaments. The L. argata (Lath.), the Asiatic marabou or adjutant, has no equal in size except the jabiru and ostrich; the length from the point of the bill to the claws is 7½ ft., and the expanse of wings is nearly 15 ft.; it stands 5 ft. high. The bill is about 2 ft. long, straight, strong, and sharp-pointed; the wings long and ample, the tail moderate and broad, tarsi strong, and toes long, the anterior webbed at the base. The head and neck are nearly bare of feathers, and in front of the neck hangs a pouch or dewlap several inches long and capable of considerable distention. The bill is yellowish white, and its gape is such that it can swallow whole an animal as large as a cat; front of the neck yellowish, back of neck reddish with a few hairy warty excrecences; the back and wing coverts deep bluish ash, wings dusky, breast and belly dusky white; the feathers of the sides beneath the wings, and those of the vent and under tail coverts, are whitish, downy, about 12 in. long, and so light and delicate as to command a high price for ladies' head dresses; a feather a foot long and 7 in. wide weighs only 8 grains. It is common in Bengal, and by the natives each is believed to be possessed by the soul of a Brahman; by the English it is called adjutant from its resemblance at a dis-

Ash-leaved Maple (Negundo aequalides).

Marabou (Leptopilinus marabou)

tance to an officer with white waistcoat and breeches. Its voracity is extreme, exercised upon anything which comes in its way, from orffal, fish, and reptiles, to birds and quad-
rapeds, and even to the cooked meats of the natives; its services are valuable as a seavanger, and its presence is encouraged; it has even been domesticated. In the wild state, they live in small flocks near the mouths of rivers; their power of flight is great, and their vision very keen. A smaller species (L. marabou, Temm.) occurs in tropical Africa, assisting the vultures in consuming the flesh of the negro villages; it is more ugly, if possible, than the Asiatic bird, and its delicate plumage are equally valued; marabou is the native African name. Other species are described, with similar characters.

MARACAYBO, or Maracibo. I. A city of Venezuela, capital of the state of Zulia (formerly Maracaybo), situated on the W. shore of a channel connecting the lake and gulf of the same name, about 25 m. from the gulf, and 300 m. W. of Caracas; lat. 10° 40' N., long. 71° 40' W.; pop. about 15,000. The city is built on a sandy soil, and the N. portion, upon a rising ground, commands a fine view of the lake. The houses, a few of which are handsome, are for the most part of chalk and sand, or of wood, and covered with reeds. The harbor is commodious and well defended by three fort; but, owing to the bar at the entrance, only vessels drawing less than 10 ft. can come up to the town. The climate is excessively hot, but more salubrious than that of the lowland towns of the eastern and inland states. Heavy rain falls from May to November; and in the other months violent and even disastrous rains, accompanied by terrific lightning and thunder, are not infrequent, but hurricanes are unknown. Earthquakes are common. The principal articles of export are cacao, cotton, sugar, fustic, and coffee; of the last 23,000,000 lbs. were exported in the year ending June 30, 1872. Cattle are reared in large numbers in the surrounding country. Ship building, for which a dockyard in the port offers superior facilities, is extensively carried on. There is an important coasting trade. The foreign trade is mostly in the hands of English, French, and Germans.—This city was founded in 1571 by Alonso Paecheo, who named it Zamora; it was afterward called Maracaybo, after a powerful cacique of the lake region. It has frequently suffered by fire and earthquakes. II. Lake Maracaibo, a large lagoon or inlet of the sea, in shape resembling a guitar, lying immediately S. of the city; length, nearly 100 m.; greatest breadth, 75 m. The channel connecting the lake with the sea is 45 m. long and from 4 to 14 m. wide, and deep enough except over the bar at its mouth for the largest vessels. The shores of the lake are low and barren, and at certain seasons inundated to a distance of 10 or 20 m. Its waters, being fed by about 500 small streams (only about 100 of which however are perennial), are generally fresh when the S. wind prevails; at other times they are brackish. On the N. E. shore is a mine of mineral pitch, which at night during the hottest months emits a brilliant phosphoric light resembling lightning, and called by navigators the lighthouse (faro) of Maracaybo. The carrying trade on the lake is done by schooners; but it is now proposed to establish also one or two lines of steamers. III. Gulf of. See VENEZUELA.

MARAJÓ, or Joanes, an island of Brazil, in the mouth of the Amazon, which it divides into two unequal branches; length about 180 m., greatest breadth about 150 m.; pop. about 20,000, almost exclusively Indians. The land is generally low and flat, and is watered by several navigable rivers and a number of small streams; the principal of the former are the Moudin, with a course of about 50 m., and the Arajá, of 60 m. The climate is similar to that of the province of Grão Pará. The soil, though marshy, favors the cultivation of most of the tropical products, especially rice, which is grown in prodigious quantities; but the principal occupation of the people is the rearing of cattle, which find excellent pasture in the vast prairies of the island.—Marajó was first given to Antonio de Souza de Macedo, baron Joannes, and was long known by his name. The Tupinambás Indians, who inhabited it, were civilized by the Jesuit priest Antonio Vieira; they were celebrated canoe builders and coopers. The island was united to the province of Grão Pará about 1830.

MARANHÃO, or Maranhâm. I. A N. E. province of Brazil, bounded N. by the Atlantic, E. by the province of Piauí, S. W. by Goyaz, and W. by Grão Pará; area, 168,000 sq. m.; pop. about 380,000, consisting chiefly of Indians. The coast line is very regular to the east; but about the middle it is deeply indented by the vast bays of São José and São Marcos, between which lies the island of Maranhão, opposite the embroiled mouths of the Paraíba and Taquari rivers; still further W. occurs the small bay of Cuma, Cabello, and Turiaçu, the last forming the mouth of the river of the same name. From this point to the extreme west, and indeed to the mouth of the Pará, or more properly the Amazon, the shore is fringed with innumerable islets, keys, and reefs. The coast of Maranhão is mainly low and flat; high red cliffs border the shore of the island, and of the mainland to a considerable distance westward. The principal elevations are in the southwest and south, whence low parallel ridges sink almost due N., where they sink into extensive plains. Of the principal rivers, the largest are the Parahyba, forming the entire E. boundary, and receiving a host of important tributaries from the southern corner of the province; the Itapicurú, Meiram, and Pindaré, all navigable nearly to their sources, and the last two uniting 15 m. N. of the town of Meiram to form the Maranhão; the Turiaçu and the Gurupi, separating the province from that of Grão Pará; while the S. boundary line is constituted by the Tocantins and its N. E. affluent the Manoel Alves Grande. A great part of the country is densely wood-
MARANHÃO

ed, but in the interior occur some extensive campos and alluvial flats, which are frequently inundated. Gold mining on a large scale was attempted at Maracassumé, but was abandoned about 1867. Silver, platinum, rich copper ore, antimony, and arsenic have been discovered in many parts; iron is general throughout the province; there is petroleum on the Itapeurá; sulphur is said to exist at Rosario, and saltpetre and hydraulic lime at Alcantara and Guaraú; and about 60,000 tons of salt are annually produced on the Alcantara coast. The climate is hot and damp, like that of the Amazonian valley, of which, according to Agassiz, it once formed a part; the thermometer ranges from 69° to 97° F. The light rains begin in October, but the rainy season sets in in December and lasts till May, with much thunder and lightning, especially toward the close; and from June to December the general winds blow steadily from the northeast by day, and from the east by night. The principal products are rice, cotton, sugar, and coffee; the last is now abundantly grown on the mountain slopes inland, and will probably soon take the place of cotton as a staple for exportation. Oils of various kinds are extensively extracted, but mostly for domestic use, except copaiba, the annual production of which is about 100 pipes; and sarsaparilla, anatto, vanilla, cajú, rosín, and many valuable medicinal plants are found in great plenty, but have not yet become important commodities. In 1854, 13,000,000 lvs. of cotton were exported, valued at $987,197; and in 1869, 12,500,000 lvs. valued at $1,784,955. The total value of exports in 1867 was $3,150,426, and of imports (consisting mainly of machinery and manufactured goods) $2,712,560. Marantea de tartaruga, a kind of butter from tortoise eggs, is extensively manufactured. There are three foundries and one machine shop; superior embroideries and laces are made; but the larger portion of the inhabitants are engaged in agricultural pursuits. Maranhão has eight cities and 28 towns; the more important of the former, besides the capital, are Caxias, Vianna, and Alcantara. Education is here more general than in any other province of the empire, there being a lyceum with 12 chairs of languages, sciences, and law, several seminaries, and numerous other schools. Maranhão has produced many of the most prominent Brazilian men of letters, arts, and sciences.

II. San Luiz de Maranhão, a maritime city, capital of the province, on the W. side of the island of the same name, lying at the mouths of the Itapeurá and Maranhão rivers, 1,410 m. N. of Rio de Janeiro; lat. 2° 31' S., lon. 44° 18' W.; pop. of the island in 1872, 34,028, of whom about 30,000 were in the city. The city is defended by a line of high red cliffs skirts the shore of the island to the north, from which direction it is accessible only by narrow passes. The streets are regularly laid out, are spacious, well paved, and lighted with gas. The houses are well built, many of them being of two stories, and surrounded with gardens. The finest of the public buildings are the cathedral and the episcopal palace, both the work of the Jesuits. There are ten other churches and chapels, eight convents, the governor's house, town hall, custom house, post office, prison, and one military, one foundling, and several general hospitals. The benevolent institutions comprise asylums fororphans and indigent females, besides several societies for the protection and relief of artisans. There are two banks, several mercantile and industrial associations, and a number of insurance companies. The educational establishments are a lyceum in which are taught languages, sciences, law, and philosophy, two seminaries, and many primary and grammar schools. The public library contains about 10,000 volumes. Eight periodicals are published. A botanic garden has lately been established. The climate is extremely hot and unhealthy. — Maranhão is the entrepot for the productions of its own province and those of Grão Pará, Piauí, Rio Grande do Norte, and Ceará. The port is easy of access, well defended by a series of forts, and affords good anchorage for vessels drawing 20 ft. of water. The exports and imports for the second half of 1871 amounted to $1,021,468 64 and $1,063,225 30 respectively. In 1870 there were exported 12,135,000 lbs. of cotton and 6,938,280 lbs. of sugar. Among other exports are hides, balsam copaiba, and unprepared isinglass. The chief imports are manufactured goods and machinery. Half of the foreign trade is with Great Britain, and about one tenth with Portugal. The maritime statistics for the year ending June 30, 1872, were: entered, 40 steamers and 36 sailing vessels, tonnage 44,272; cleared, 39 steamers and 51 sailing vessels, tonnage 52,250. Besides a direct line of steamers to Lisbon and Liverpool, there are two touching at Ceará and Belém or Pará, all established since 1867, and almost monopolizing the carrying trade between Maranhão and Europe. The rivers Itajicurá, Meirim, and Pindaré are navigated by steamers, and there are also coasting lines to Rio de Janeiro and to Pará. — Maranhão was founded in 1612.

MARATON. See Amazon.

MARAT, Jean Paul, a French revolutionist, born of Protestant parents at Baudry, near Neufchâtel, Switzerland, May 24, 1744, assassinated in Paris, July 13, 1793. He was educated as a physician; but the narrow sphere in which he lived offering scanty means to satisfy his ambition, he went abroad. At 30 years of age he was at Edinburgh, where he obtained a living as private tutor, and published a revolutionary pamphlet in English, entitled "The Chains of Slavery," which appeared in French at Paris in 1792 (latest ed., 1850). In the following year, by a more voluminous publication, De l'homme, ou des principes et des lois de l'influence de l'âme sur le
corps et du corps sur l’âme (3 vols., Amsterdam, 1775), he appeared as an opponent of Voltaire, and a literary controversy ensued between them. He removed to Paris, and from 1779 to 1788 published a series of writings in which he attempted to revolutionize natural philosophy, and to refute the Newtonian theory. His success being far inferior to his pretensions, he relinquished the field of literature and endeavored to establish himself as a physician; but after many disappointments he was obliged to accept a position as veterinary surgeon to the count of Artois, afterward Charles X. The outbreak of the revolution gave him the opportunity to play the part of a demagogue. Although physically not prepossessing, being hardly five feet high, with a strange mixture of the ludicrous and terrible in his countenance, he soon obtained a vast influence over the lower classes by his energy and resolution. On Sept. 12, 1789, he published the first number of the Publiciste Parisien, the title of which was afterward changed into Ami du Peuple. As early as August of that year he had publicly proclaimed that 800 members of the national assembly ought to be hanged, Mirabeau the foremost among them. In the same spirit every page of the Ami du Peuple was written. This journal, under the successful titles Le Journal de la République Française and Le Publiciste de la République Française, was continued without interruption till July 14, 1793. At the same time he also published several revolutionary pamphlets, and 13 numbers of a political journal entitled Le Jour du Jour Français. Having been introduced by Danton into the club of the Cordeliers, he created there disturbances so violent that the municipality ordered his arrest in January, 1790. He evaded it by secretly leaving the walls of the Cordeliers, whence he continued to issue his periodical. After the king’s unsuccessful attempt at flight, Marat again ventured into publicity, and directed his attacks against the Girondists. Having been prosecuted in consequence, he returned to his former underground haunts, from which he again emerged in the riots of August, 1792. He now became the right-hand man of Danton, then minister of justice, introduced himself into the vigilance committee established by the municipality of Paris, and was one of the chief instigators of the massacres of September. To reward him for the part he had taken in those atrocities, the people of Paris elected him to the national convention. Here his speeches were received by the party of the majority with a feeling of abhorrence mingled with contempt. They moved a vote of censure against him for having advocated the establishment of a dictatorial power. When, after angry discussions, the motion was at last withdrawn, Marat produced a pistol from his pocket, exclaiming that, if the motion had passed, he would have blown his brains out in the presence of the convention. Emboldened by impunity, he grew more fanatical every day, and his paper denounced the French generals and armies as incapable, and asked for the heads of 270,000 “traitors,” and the massacre of three fourths of the members of the convention. In vain the Girondists endeavored to break down his influence. Under the pressure of popular excitement, created by foreign intervention, the ultra-revolutionary party had gradually obtained the ascendency, and the most sanguinary proceedings being considered unavoidable in order to prevent a cooperation of the anti-revolutionary elements with the foreign foe, Marat, who excelled all others in this respect, was almost adored by the Parisians as the saviour of the country. Thus, in April, 1793, he succeeded in obtaining the passage of a “law for the arrest of suspicious persons,” by the operations of which no fewer than 400,000 individuals were imprisoned throughout France. Having, as chairman of the Jacobin club, signed an address to the people, in which the assassination of the Girondists was openly called for, he was prosecuted before the revolutionary tribunal. But his trial became a triumph. The public prosecutor, the jurors, and the audience did him homage, and he was carried in triumph to the national convention, where Danton delivered an eloquent oration in his honor. He now rapidly rose to the culminating point of his career. Having made the municipality subservient to his plans, he instigated the mob of May 31, 1793, by which the Girondist party was completely destroyed. With Robespierre and Danton he formed a triumvirate, which for the time determined the destinies of France. Confined by disease in his garret, Marat was restlessy active in stirring up, by letters and denunciations, the passions of the people and of the national convention. He was finally assassinated by Charlotte Corday, while preparing a list of Girondists to be delivered to the committee. After a few days before his life would probably have ended from natural causes. (See Corday.) Robespierre used his death as a pretext for carrying the reign of terror to its utmost extent. Hundreds of victims were sacrificed to the “manes of the martyr.” The entire national convention attended his funeral. His body was transferred, Nov. 4, 1793, to the Pantheon, and his portrait, executed by David, adorned the hall of the convention. A pension for life was voted by the “grateful nation” to his concubine. Two years later, when the revolutionary passions had cooled down, the remains of Marat were removed from their resting place and his portrait taken down. Though vain and egotistic, Marat was doubtless sincere in his sanguinary ravings, and was so disinterested that, even in the height of his power, he lived in the most abject poverty.

MARATHON, a town of Greece, near the E. coast of Attica, about 18 m. N. E. of Athens, near which the Persians under Datis and Artaphernes were defeated, in 490 B. C. (Sept. 29 or 30, according to somewhat uncertain compu-
of Raphael in the Vatican, and those of Annibale Carracci in the Farnese palace. His masterpiece is the "Martirdom of St. Diagio" at Genoa. He also executed several etchings from his own designs and from Italian masters.

MARREAU, Jean Baptiste François, a French philanthropist, born at Brives in 1798. He became an advocate in Paris, and published in 1824 a treatise on proceedings at civil law, and in 1834 one in the interest of the working classes. In 1844 appeared his Études sur l'Economie sociale. In the same year he was appointed adjunct mayor, and founded the first infant asylum (crèche) at Chaillot. He set forth the utility of such institutions in Des crèches (1845), which has had many editions and translations, and obtained a Montyon prize of 3,000 francs, which he appropriated to one of the principal asylums. His beneficent enterprise led to the establishment of hundreds of infant asylums all over France.

MARBLE, a N. county of Wisconsin, bordering on Michigan, and drained by the Wisconsin river and its branches; area, 6,048 sq. m.; pop. in 1870, 6,885. It has a diversified surface, extensive pine forests, and numerous small lakes. The chief productions in 1870 were 35,327 bushels of wheat, 76,482 of oats, 22,164 of potatoes, 8,38S of peas and beans, and 2,845 tons of hay. There were 273 horses, 1,581 milch cows, 2,754 other cattle, 1,492 sheep, and 1,215,000 chickens. Capital, Wausau.

MARATTI, Carlo, an Italian painter, born near Ancona in 1625, died in Rome, Dec. 15, 1713. At about the age of 12 he was sent to Rome and put under the instruction of Andrea Sacchi, with whom he remained eight years. He became a student of the works of Raphael, and his contemporaries, supposing that he could only paint madonnas, called him Carluccio delle Madonne; but he silenced their sneers by executing for the baptistery of St. John Lateran a picture of the three youths in the fiery furnace, which caused him to rank among the first painters of the day. He restored the frescoes of Raphael in the Vatican, and those of Annibale Carracci in the Farnese palace. His masterpiece is the "Martirdom of St. Diagio" at Genoa. He also executed several etchings from his own designs and from Italian masters.

MARBLE, a rock used as an ornamental building stone, for interior decorations, and for sculpture. Generally, any limestone that can be obtained in large sound blocks, and is susceptible of a good polish, is marble; and the only marble that is not limestone is the serpentine and the onyx (a mixture of serpentine and limestone). It is found in beds in various geological forma-
tions. In the aozic group it is a metamorphic rock of granular and crystalline structure, and often presents a fineness of texture and purity of shading that fit it for the choicest works of the sculptor. In the palaozoic formations it bears more of the character of a sedimentary rock, and it is apt to contain organic vestiges, as corallines and fossil shells, which indeed sometimes compose nearly its whole substance; it is also of variegated colors, and sometimes is of breciated structure, evidently made up of fragments of an older rock, the layers of which, broken up and confusedly rearranged, have been cemented together. Though thus varying greatly in color, texture, and structure, the composition of marble is for the most part essentially the same; it is a carbonate of lime, or a combined carbonate of lime and carbonate of magnesia, and is readily burned and to quicklime. It is soft and easy to work with the chisel or hammer, generally of even grain, so as to be split with wedges, and of specific gravity about 2.7, making the weight of a cubic foot about 169 lbs. Its durability is very variable, some varieties retaining sharp edges when exposed for many years to the weather, and others soon crumbling away.—Many varieties of marble have acquired a name and celebrity from remote times. The ease with which the rock is worked caused it to be selected for the earliest structures. The names of many marbles famous among the ancient Greeks and Romans are still retained, and their localities are known. Mt. Pentelicus in Attica furnished the valuable Pentelican white marble, called by the moderns Pentelit marble; the islands of Paros and Naxos, the still celebrated Parian marble; and other similar white marbles came from Mt. Hymettus in Attica, from Thasos and Lesbos, from Corallus in Phrygia, from Cyzicus on the Propontis, and one variety, exceeding the Parian in whiteness, from Luna in Etruria. Of the first named (the Pentelitan) the Parthenon was built, and also the temple of Ceres at Eleusis, besides many celebrated statues. Though of finer grain than the Parian, it is said not to retain its polish and beauty so well. The Parian marble is placed first by both Theophrastus and Pliny in their enumeration of ancient marbles. Pindar and Theocritus also celebrated its praise. The statues of Venus de’ Medicis, Diana Venatrix, the Oxford marbles known as the Parian chronicle, and many other famous works, are of this marble. Black marbles are occasionally referred to by the ancients; but some of those named, as the Chiusan marmor from the island of Chios, appear to be of questionable character. This one is sometimes called lapis obiditans antiquorun. It was glossy black, and received so high a polish that it was made into mirrors. The green marbles were serpentines from various localities. Yellow marble was obtained at Corinth. The marmor Phengites of Cappadocia was white with yellow spots; the Rhodian was marked with golden-colored spots, and that of Melos (Milo) was yellow.—The marbles of modern times have been variously classified and named. In southern Europe two general divisions are made of antique and modern. The quarries of the former being long since abandoned, the stones is obtained only from ancient monuments; and being consequently most highly prized, methods are resorted to, and sometimes with success, to attach the name antique to stone from quarries now worked. It is also the case that some of the marbles held in the highest estimation in France, being transported from monuments at Rome, are the product of quarries worked in ancient times in France. It is probable these might be again discovered. Without reference to these marbles, however, the French boast that their country surpasses even Italy in the beauty and variety of this class of stones. The following are convenient divisions in which marbles may be arranged for a general notice of the most important of them: 1, the simple or single-colored marbles; 2, the variegated; 3, the breciated; 4, the lumachella or fossiliferous. These sorts, however, pass into each other, so that some may be placed indifferently either in one or the other of two groups. 1. The best known of the first class are the plain white marbles, some of which have been already named. The white marble of Carrara, of which an account is given in the article CARRARA MARBLE, is of a texture like loaf sugar, differing in this respect from the Parian marble, which on close examination appears to be made up of the most delicate plates or scales, confusedly but most closely united together. Pure black marble is found in some ancient Roman sculptures. Some varieties of it are obtained in Derbyshire, England, and in Kilkenny, Ireland; but as the latter is more or less intermixed with fossil shells, it should come under the fourth division. It is quarried in the United States at Shoreham, Vt., and Glen’s Falls, N. Y., and specimens are obtained from some other localities. The colored marbles are generally variegated; they sometimes come in the form of a uniform yellow color, or the same clouded. Some of the red marbles of Italy also display only the one color. In North America white marbles are worked at various places on the range of the great belt of metamorphic rocks through Canada, Vermont, western Massachusetts, a little back of the cities of New York, Philadelphia, Baltimore, and Washington, and thence through Virginia and the Carolinas into northern Georgia and Alabama. It is this formation that supplies the white marble for building purposes to the different cities along its range, and its quarries in Massachusetts and New York furnish the marble for the most costly edifices of southern cities. The statuary marble is only the finest grained variety of this common building stone. Many localities are known to furnish it in small beds interstratified with the coarser marble. Several quarries of fine statuary marble have been opened in Vermont. The first were at Rut-
land, but other localities have since been found. Excellent quarries are also found in other parts of the United States. 2. The variegated marbles are those variously spotted, shaded, and veined. They are the most numerous class, and include the most beautiful of the colored marbles. None are more highly esteemed than the variegated yellow marble of Siena. This and the Italian dark red marbles may be seen in many of the costly mantels in our marble shops; and also the soft, shaded, dove-colored Lisbon marble, of which are made the smaller columns in the entrance of the Unitarian church at the corner of 4th avenue and 20th street, New York. The black Genoese marble, with golden-colored and white veins, called Portoro marble, the best of which is from Porto Venese, has for many years past been the most popular and the best known foreign marble in all parts of the United States, though now rather out of fashion. It is a weak stone, and is for the most part used in thin slabs cemented upon a back of slate. The marbles of this class found in the United States east of the Rocky mountains have not attained much celebrity, nor do we know of any worthy of it, unless we should include among them certain varieties of the brecciated marbles from northern Vermont and Tennessee. The gray and white clouded limestones of Thomaston, Me., are quarried to considerable extent for marble, and may be seen in common use in portions of the eastern states. They possess little beauty. California has furnished of this class some very showy marble of brilliant reddish and brownish colors, and susceptible of a high polish. It is imported into New York and used for mantels. 3. The brecciated marbles are composed of angular fragments, it may be of various mineral substances, united in a bed or paste of calcareous cement; or the mass may be so divided by numerous veins into pieces as to present the appearance of broken fragments irregularly united. Brecciatas are breccias, in which the fragments are very small; we incorrectly apply the name only to a reddish brecciated marble brought to this country from Spain. The varieties of this class are very numerous; but some of the most celebrated are never seen here, such as those called le grand deuil and le petit deuil, literally the full mourning and the half mourning. These come from the Pyrenees and different parts of France; they are of a black ground spotted with white fragments. Among the brecciated marbles of the United States, the best known is that of the Potomac on the Maryland side, some miles below the Point of Rocks. The principal use that has been made of it was to furnish the columns in the old chamber of representatives at Washington. The irregularities of hardness in the different ingredients render it an expensive stone to work; still the quarries are deserving of more than government patronage. The stone is certainly handsomer than the Italian red and white breccia imported for the inner columns of the central arched entrance of the church before mentioned. Quarries have been opened in the northern part of Vermont, near Lake Champlain, which produce the most beautiful of the American colored marbles. They are brecciated, though they pass into the variegated. They present a great variety of colors, from a deep red, traversed with veins of white, to rose-tinted flesh color mottled with whitish spots. In some specimens the brecciated structure is very strongly marked, the fragments being large with sharp edges and of decided shades of dark red, drab, and salmon, upon a ground of white bordered with rose. Unlike the Potomac marble, the fragments are not different varieties of rock, but are all limestone. The stone, though somewhat hard for marble, is still of uniform texture and takes an even high polish. Some large blocks closely resemble the foreign brocatella. It is however very difficult to work. Other marbles of this character and of rather dark red colors abound near Knoxville, Tenn., and have been brought into notice by the extent to which they are employed in the construction of the capitol at Washington. 4. Lumachella or fossiliferous marbles are those which contain petrified shells. These are sometimes so crowded upon one another, that they compose the whole mass of the stone; sometimes single shells are seen scattered throughout the block. These marbles are very abundant in Europe, and also throughout New York and the western states. Handsome mantels are made of American varieties which are composed entirely of fossil shells, but they are rather to be regarded as curious than beautiful. They lack the high colors of the brecciated and variegated marbles, and though they take a good polish, they are from their plain colors comparatively dull and sombre. Some of the best of the kind is from Beecraft's mountain, back of Hudson, N. Y., which is thus noticed by Prof. Silliman ('"American Journal of Science," vol. vi., p. 371): "The marble is of a grayish color with a slight blush of red; its structure is semi-crystalline, and in some places highly crystalline, especially in and around the organized bodies which in vast numbers it embraces. The large slabs present a great diversity of appearance, and can scarcely be distinguished from the similar transition marble of the Peak of Derbyshire, which it quite equals in beauty and firmness."—Serpentine, as before stated, differs in composition from the other marbles. It consists of about equal parts of silica and magnesia with 12 per cent. of water. It is a soft mineral of different shades of green, of waxy lustre, and susceptible of a high polish. It is better adapted to ornamental work than in doors than to be exposed to the action of the weather. Verd antique is a mixture of green serpentine and light-colored limestone. These varieties come from Genoa and Tuscany, and the best verd antique from Egypt. In Vermont and Canada serpentine abounds;
and verd antique may be obtained in various places in New York and Pennsylvania, and in any of the New England states. At Milford, Conn., a quarry of serpentine and verd antique was worked more than 50 years ago, which furnished slabs pronounced by good judges quite as fine as the European stone. —The methods of preparing marble for use differ from the working of granite. This hard rock, after being quarried, is split by small wedges driven into holes drilled in a line, and is then dressed by hammers or used in the rough. Marble, being a comparatively soft rock, is cut into slabs by a process of sawing with smooth iron saws fed with sharp sand and water. Several of these plates or saws are set in one frame, and in a large establishment 20 or more of the frames may be seen kept in steady operation by a steam engine. The progress of the saws cutting down through the great blocks of marble seems very slow, for the most part not exceeding an inch per hour. The thickness of the slabs is usually four or six inches. In this form the marble is used for facing the walls of buildings upon a back of brick, giving all the effect of a solid wall of marble at much reduced cost. In the most expensive structures only are the walls built of solid blocks of marble or freestone. Marble slabs for mantels and other interior work are sawed like those for building, and are then rubbed smooth upon a heavy revolving table of cast iron, called the rubbing bed, and afterward polished.—According to the census of 1870, there were 23 marble quarries in operation in the United States, employing a capital of $1,316,000. The total products amounted to $804,500. The most extensive quarries were in Maryland, where the products for the year were valued at $275,000; New York, $222,000; Vermont, $130,800; Pennsylvania, $101,000; and Massachusetts, $59,500. Marble valued at $3,790,518 was worked into monuments and tombstones, valued at $8,916,654. The value of marble and stone and manufactures thereof, imported into the United States during the year ending June 30, 1873, was $1,099,289, of which $453,818 was from Italy.

MARBLE, Manton, an American journalist, born in Worcester, Mass., Nov. 16, 1835. He graduated at the university of Rochester in 1855, was soon after connected with the Boston "Journal," and subsequently was editor of the Boston "Traveler." In 1858 he went to New York and joined the staff of the "Evening Post." In 1859 he made a trip to Red river and beyond, corresponding with the "Evening Post," and contributing three papers descriptive of the journey to "Harper's Magazine." He has been connected with "The World" newspaper from its establishment, June 16, 1860, and became its proprietor and editor in April, 1862, making it a free-trade and democratic journal.

MARBLEHEAD, a town and port of entry of Essex co., Massachusetts, at the terminus of a branch of the Eastern railroad, 12 m. N. E. of Boston; pop. in 1870, 7,708. It is built upon a peninsula projecting into Massachusetts bay, about 4 m. in length and 2 in breadth, with an area of about 3,700 acres, and joins Salem on the west. The surface is elevated, and is exceedingly irregular and rocky. The harbor is deep and convenient, and is about 1 ½ m. long by ½ m. wide. The town has been noted from the first settlement of New England for the enterprise of its people in the fisheries. More recently the inhabitants have also engaged extensively in the manufacture of boats and shoes. For the year ending June 30, 1873, the number of vessels engaged in the cod and mackerel fisheries was 59, with an aggregate tonnage of 2,098; belonging to the port, 64 vessels, of 2,554 tons. There are two national banks, a savings bank, graded public schools, with a high school, a weekly newspaper, and eight churches.—Marblehead was originally a part of Salem, and was incorporated as a distinct town in 1649, at which time it contained 44 families. Many of the settlers were from the Channel islands; and their peculiarities of language are still to be noticed among the inhabitants, and formerly existed to such a degree as almost to constitute a separate dialect. At the commencement of the revolutionary war Marblehead was reckoned the second town in Massachusetts in population and wealth. It contributed a regiment of 1,000 men to the army, and at the end of the war there were 600 widows and 1,000 fatherless children in its population of less than 4,000. During the war of 1812 the frigate Constitution was chiefly manned by men from Marblehead, and the town also sent out a great number of privateers; and when peace was declared it was found that 500 of its citizens were held in England as prisoners of war. In the civil war it was the first town to send troops to Boston (April 16, 1861), and furnished altogether 1,440 men.

MARBLES, Playing, little balls of marble, baked clay, agate, or other stony substance, used as toys for children. Marbles are made in immense quantities in Saxony for exportation to the United States, and to India and China. They are also largely manufactured in the agate mills at Oberstein on the Nahe, in Germany, particularly for the American market. The material used in Saxony is a hard calcareous stone, which is first broken up into square blocks with a hammer. These are then thrown 100 to 150 together into a mill, which is constructed of a stationary flat slab of stone, with a number of concentric furrows upon its face. Over this a block of oak of the same diameter, partially resting upon the small stones, is kept revolving, while water flows upon the stone slab. In 15 minutes the marbles are worn completely round, and are fit for sale. An establishment with three mills will manufacture 90,000 marbles in a week. Agates are made into marbles at Oberstein by first chipping the pieces nearly round with a hammer, and then
wearing them down upon the face of large grindstones. The hard stones are managed with great dexterity by the workmen, who in a few minutes bring them into the shape of perfect spheres.

MARBOIS, Barbé. See Barbé-Marbois.

MARBURG, a town of Prussia, in the province of Hesse-Nassau, on the river Lahn, 49 m. S. W. of Cassel; pop. in 1871, 9,065. The principal public buildings are the church of St. Elizabeth, a fine, perfectly preserved specimen of the pointed Gothic, built in the 13th century, and the ancient castle of the landgraves of Hesse on the Schlossberg (now used as a penitentiary), where the famous discussion on transubstantiation between Luther and Zwingli took place, Oct. 1–3, 1529. The university of Marburg was the first founded in Germany after the reformation, by the landgrave Philip the Magnanimous (May 30, 1527); it was richly endowed from the proceeds of the confiscated property of the clergy, and attracted students from all parts of Protestant Europe. Although a rival university was established in Giessen in 1607, it continued to flourish until the outbreak of the thirty years' war. From 1625 to 1650 the Giessen university was united with that of Marburg, but they have since been again separated, the former being now the national university of Hesse-Darmstadt. In the first part of the 18th century Marburg derived great celebrity from the philosopher Christian von Wolf, who was one of the professors. In the winter of 1873–74 the university was attended by 433 students, mostly medical. It contains a library of about 130,000 volumes, an anatomical theatre, an observatory, an admirable chemical laboratory, a botanic garden, a lying-in asylum, a clinic, a school for veterinary surgeons, a zoological museum, a philosophical seminary, and one for political sciences. Marburg possesses also a gymnasia and other educational institutions, a society for natural history, and a Bible society. The chief manufacture is pottery. The town was several times besieged during the seven years' war. In 1806 and 1809 it was the scene of risings of the Hessian peasantry against the French, who destroyed in 1810 and 1811 the greatest part of the fortifications of the castle.

MARCEAU. See Ramondel.

MARC'ANTONIO. See Ramondel.

MARCEN, François Séverin des Graviers, a French soldier, born in Chartres, March 1, 1769, died at Altenkirchen, Rhinish Prussia, Sept. 23, 1796. His father, a lawyer, intended him for the legal profession; but he enlisted in 1785, and was sergeant in 1789, when he was prominent in the taking of the Bastille. In 1792 he was assigned to the army of the Ardennes, where as commander of volunteers he restored obedience to the commanding general Lafayette. Rapidly promoted for bravery, he was made general of division in 1793, and distinguished himself with Kléber in the war of the Vendée, especially at the battle of Savennay. His magnanimity in saving the life of Angélique de Melliers, a female royalist combatant, was misrepresented as an act of treason, but he was acquitted. In 1794 he mainly decided the victory at Fleurus (June 26), which placed Belgium at the mercy of France. The committee of public safety called him "the lion of the army." and immediately placed him in charge of the right wing of the army of the Sambre and Oise, Jordan being commander-in-chief, and Kléber at the head of a division. In October he achieved a brilliant success in capturing Coblenz, the great focus of the emigrant nobles. In 1795 he took part in the siege of Ehrenbreitstein. While commanding the rear guard on the right bank of the Rhine, he was driven to despair by the premature destruction of a pontoon on the Sieg, and would have committed suicide if it had not been for the intervention of one of his aides-de-camp. Kléber arrived in time to rescue him from his perilous position. In 1796 he was placed at the head of the first division to cover the retreat of Pichegrun from Mentz, and to protect the operations of Jourdan, whom he enabled to effect a junction with Kléber. At the end of July he took Königstein, after having battled an attempt of the enemy to make a sortie from Mentz, which place he invested, and gained several other important successes. While occur-
pying the plain of Altenkirchen, awaiting the arrival of Jourdan, he undertook a reconnoissance, Sept. 20. He was severely wounded by a ball, and was carried within the enemy's lines, where he died three days after. His obsequies were celebrated with great pomp, the Austrians firing minute guns in his honor. A pyramid erected near the spot where he fell was subsequently removed to the neighborhood of Coblenz. In his native town monuments were erected in his honor; and in September, 1851, a bronze statue of him was placed in the principal square.—See Kliëber et Marceau, by Charles Despréz (Paris, 1857).

MARCELLO, Benedetto, an Italian composer, born in Venice, July 24, 1686, died in Brescia, July 17, 1739. His father was a Venetian senator, and personally superintended his education. He studied music thoroughly, learning counterpoint under Gaspari, became an advocate, and held several important offices, being a member of the council of forty and treasurer at Brescia. His most esteemed work is his music for Giustiniani's version of 50 of the Psalms. The pieces were written for two, three, and four voices, with accompaniment for organ or clavichord, several having also obbligato for violoncello or two violas. John Garth of Durham published a fine edition of these psalms in eight folio volumes, with English words. Marcello's other works consist of oratorios, masses, cantatas, madrigals, and different parts of the Roman Catholic service. He wrote also what he styled a "Drama for Music," and Calisto in Ora, a pastoral with the use of scenery; a variety of instrumental compositions, and two satirical madrigals. Besides these musical works, he left a treatise in manuscript on music, a poem upon the redemption, and a collection of sonnets, verses, burlesque poems, and dramas. He is justly considered as one of the greatest of the Italian masters; his style being noble and sustained, his invention poetical, and his thought and musical forms full of originality.

MARCELLUS, Marcus Claudius, a Roman general, born about 268 B.C., killed near Venosa, in Apulia, in 208. The family to which he belonged (a plebeian branch of the great Claudian gens) was of the highest distinction in Rome. Marcellus was early known as a bold and skilful soldier, serving in the first Punic war. His first office was that of curule aedile, to which he was chosen about 226. Shortly afterward he was elected augur, and in 222 he was made consul. While holding that office he brought the Gallic war to a successful termination, killing the leader of the Gauls with his own hands. Marcellus dedicated the spoils of the Gallic chief as spolia opima in the temple of Jupiter Feretrius, being the third and last instance of such dedication in Roman history. He was one of the praetors in 216, when the second Punic war was at its height, and was about to sail for Sicily when the defeat of the Romans at Cannae caused a change in his destination. Employed against Hannibal, he prevented the town of Nola from falling into his hands, and repulsed his forces, which was the first check received by the Carthaginian. He was summoned to Rome to take part in the consultations concerning the conduct of the war, and then sent back to Campania as proconsul. Elected consul in 215, with another plebeian for colleague, he resigned the office rather than offend the senate, which was adverse to the whole consular power being in plebeian hands. Returning to his proconsular position in Campania, he again baffled Hannibal at Nola, and inflicted great loss on his army. He was elected consul in 214, having Fabius Maximus for his colleague, and resumed his Campanian command, repulsing Hannibal at Nola for the third time. Casilinum having capitulated to Fabius, Marcellus massacred all the garrison but 50. He was then sent to Sicily, which he nearly conquered in three years. The siege of Syracuse, which he maintained for two years, and in which he was opposed by the science of Archimedes, who was killed during the sack of the town (212), was one of the most famous sieges of ancient warfare. Returning to Rome in 211, he was refused the honors of a triumph because he had not entirely subdued Sicily. His ovation was very brilliant, but the magnificence of his Sicilian spoils, comprising rich works of art, gave much offence to the old Roman party. He was a fourth time consul in 210. Prevented from returning to Sicily by the opposition of the Sicilians, whom his cruelty and rapacity had alienated, he was placed at the head of the army which acted against Hannibal that year, and the next year retained the command of it as proconsul. The Romans complained of his want of vigor during the latter part of his proconsulate, but he defended himself successfully, and was elected consul for the fifth time. Having appeased the Arretians, who threatened revolt, he again assumed command of the army in presence of Hannibal, his colleague being with him. While reconnoitring the Carthaginian camp, he fell into an ambuscade, and was slain.

MARCELLUS, Nonius, an early Latin grammarian, in regard to whose personal history there is no authentic information, but who is known as the author of Nonii Marcelli Peripatetici Tubercensis de Compendiosa Doctrina per Litteras ad Filium, first published in Rome about 1470. The first critical editions appeared in 1565 and 1586. Mercier's Paris edition of 1614, with a new version of the text, was republished in Leipsic in 1826. In 1842 appeared a superior edition by Gerlach and Roth, and in 1872 the best of all by the French grammarian Louis Marie Quicherat.

MARCH (Lat. Martius, pertaining to Mars), the third month of the year, consisting of 31 days. It was the first month in the early Roman calendar, and it also marked the commencement of the year among some of the Latin Christian nations till the 18th century. The English
MARCH

legal year began March 25 until the change of style in 1752. There is an old English and Scottish proverb: "March borrows three days of April, and they are ill."

The first, it shall be wind and weet;
The next, it shall be snaw and sleet;
The third, it shall be a freeze,
Sail gar the birds stick to the trees.

It is disputed whether these "borrowing days" were the last three in March or the first three in April. Dr. Jamieson explains that when they were stormy March was said to borrow them from April that he might extend his power so much longer.

MARCH, or Moravia, a river of Austria, which rises on the N. frontier of Moravia, near Alstadt, and flows S. S. E., passing Olmütz, Kremisch, and Hradisch; then turning S. S. W., it separates Hungary from Moravia and the archduchy of Austria, and flows into the Danube 7 m. above Presburg. Its principal affluents are the Hanna, Miava, Beczwa, and Thaya. Its length is about 200 m., and it is navigable as far as Göding, 80 m., and improvements for extending navigation to Olmütz are proposed. At its mouth it is 400 yards wide. Its position on the boundary of Hungary and proximity to Vienna have made it often of historical importance. The extensive plain between the lower March and the Danube, called the Marchfield, has been the scene of several great battles, including those of Aspern, Essling, and Wagram.

MARCH, Charles W., an American author, born in Portsmouth, N. H., Dec. 15, 1815, died in Alexandria, Egypt, Jan. 24, 1864. He graduated at Harvard college in 1837, studied law, practised in Portsmouth, and was a member of the state legislature. Removing to New York, he became a writer for the "Tribune" and the "Times," and correspondent of the Boston "Courier." He was for some time vice consul at Cairo. He published "Daniel Webster and his Contemporaries, or Reminiscences of Congress" (New York, 1850), and "Sketches and Adventures in Madeira, Portugal, and the Andalusias of Spain" (1856).

MARCH, Earl of. See Mortimer, Roger.

MARCH, Francis Andrew, an American scholar, born at Millbury, Mass., Oct. 25, 1825. He graduated at Amherst college in 1845, where he was tutor from 1847 to 1849. He studied law in New York, and was admitted to the bar in 1850. After teaching at Fredericksburg, Va., from 1852 to 1855, he was appointed tutor in Lafayette college, at Easton, Pa., in 1856 adjunct professor, and in 1858 professor of the English language and comparative philology. He received the degree of LL. D. from the college of New Jersey in 1870, and from Amherst college in 1871; and in 1875 he was elected president of the American philological association. He has contributed articles on philological subjects to the "Transactions" of that body and of the national educational association, and to the Jahrbuch für romanische und englische Literatur in Berlin; and articles on jurisprudence and psychology, including discussions of Sir William Hamilton's theory of perception and his philosophy of the conditioned, to the "Princeton Review" (1860; reprinted in England, 1861). He has published "A Method of Philological Study of the English Language" (New York, 1865); "Parser and Analyzer for Beginners" (1869); "Anglo-Saxon Grammar" (1870); and "An Introduction to Anglo-Saxon: Grammar, Reader," &c. (1871). He is now (1875) editing a series of text books for college use of the Greek and Latin Christian authors, of which "Latin Hymns" and "Enseibus" have appeared.

MARCH, La, or La Marche Limousine, an ancient province of France, bounded N. by Berry and Bourbonnais, E. by Auvergne, S. by Limousin, and W. by Angoumois and Poitou. It now forms the department of Creuse, a considerable portion of Haute-Vienne, and fractions of several other departments. It was divided into Haute- and Basse-Marche, with Guéret as capital of the former and Belin of the latter. Under the Romans it was part of Aquitania Prima. Of William III., duke of Aquitaine, converted La Marche into a county in the 10th century. In 1177 it was sold to England, but Hugh IX. de Lusignan, of a family several of whose members became kings of Jerusalem and Cyprus, gained possession of the county, and it belonged to that house until early in the 14th century, when the last descendant of this branch of the Lusignans ceded it to Philip the Fair, king of France. Subsequently it passed through various hands. The most distinguished of the counts of La Marche was Bernard d'Armagnac (died in 1462); his son Jacques d'Armagnac was sentenced to death in 1477 by Louis XI., who confiscated the county for the benefit of his son-in-law Pierre de Bourbon; and after undergoing some more changes, it was permanently united to the crown toward the middle of the 16th century.

MARCHES, The, a geographical division of the kingdom of Italy, embracing the provinces of Ancona, Ascoli Piceno, Macerata, and Pesaro ed Urbino; area, 3,746 sq. m.; pop. in 1872, 915,419. The boundaries in general correspond to those of the mediaval marches of Ancona and Fermo.

MARCHESI, Pompeo, an Italian sculptor, born in 1790, died in Milan, Feb. 6, 1808. His earlier works were executed under the direction of Canova, and he became professor in the academy of fine arts, ranking among the foremost of modern Italian sculptors. Among his principal works are statues of the Venus Urania, of St. Ambrose, Charles Emmanuel, Volta, Beccaria, Bellini, and of Goethe in the public library at Frankfort; of the emperor Francis, and of Philibert Amadens of Savoy; a monument to Malibran; and 12 busts in terra cotta of warriors, which he executed gratuitously for the embellishment of the fort of Milan. His colossal marble group, the "Mater
Dolorosa with the Dead Christ on her Lap," known as "The Good Mother," or "The Celebration of Good Friday," is considered to be his masterpiece; this was presented by the emperor Francis to the city of Milan, and placed in the church of San Carlo.

MARCHISIO, Carlo, was an Italian vocalist, born in Turin in 1835, died in 1872. She inherited the musical talents of several members of her family, and thoroughly studied harmony, counterpoint, and other departments of the art. Her magnificent soprano voice secured her success on her first performance in Venice in 1855. Her surviving sister, Barbara (born in 1838), who has a fine contralto voice, appeared on the same occasion, and the two sisters performed together in Italy, France, and almost all over Europe. Rossini composed for them his Petite messe, which they executed for the first time in 1855. They were much admired in Paris in Sémiramis, and Barbara won great applause as Azucena in Il trovatore.

MARCO MANI (Gen. men of the marches or borders), an ancient German people of Slavonic race. They appear to have originally dwelt in the regions of the Main and Neckar in S. W. Germany, whence they followed Ariovistus across the Rhine on his invasion of Gaul, and afterward their own chief Maroboduus into the land of the Boii, which embraced parts of modern Bohemia and Bavaria. Having subdued that people, they established a powerful kingdom N. of the Danube, which soon became involved in wars with the Cherusci, and afterward with the Romans. Their longest and bloodiest war was that waged in alliance with the Quadi, Hermunduri, Narisi, and other German tribes, against the emperor Marcus Aurelius. The latter having died (180) in Vindobona (Vienna) on his last expedition against them, his son and successor Commodus hastened to conclude by purchase a shameful peace with the barbarians. In the 3d and 4th centuries the Marcomanni made some new invasions into the Danubian provinces of the Romans, but during the following great migration of northern nations they finally disappeared from history.

MARCO POLO. See Polo.

MARCOURT, Jules, a French geologist, born at Salins, in the department of Jura, April 20, 1824. He completed his studies at the college St. Louis in Paris, and published in 1846, in the memoirs of the geological society, his Recherches géologiques sur le Jura salinois. In the same year he was attached to the mineralogical department of the Sorbonne. In 1847 he was employed in classifying the palaeontological collection at the museum, for which institution he made geological investigations in various parts of Europe, and from 1848 to 1850 in the United States and Canada. In 1853-4 he explored the Rocky mountains, under the auspices of the American government, and he continued his American explorations in 1860, after having in the interval filled the chair of palaeontological geology at the polytechnic school in Zurich. His principal works are: "Geological Map of the United States" (English, 1853), followed in 1855 by a resume of the same, including Canada; Le terrrain carbonifère dans l'Amerique du Nord; Sur le gisement de l'or en Californie; Lettres sur les rochers du col et leur distribution géographique dans les deux hémisphères (1857-60); "Geology of North America" (1858); Diaries et trias, ou le nouveau grès rouge en Europe, dans l'Amerique du Nord et dans l'Inde (1859); Carte géologique de la terre, according to the Jura strata (1862); and Derniers travaux sur le diéas et le trias en Russie (1870).

MARCUS AURELIUS. See Antoninus.

MARRY, William Learned, an American statesman, born at Southbridge, Mass., Dec. 12, 1786, died at Ballston Spa, N. Y., July 4, 1837. He was the son of a farmer, graduated at Brown university in 1808, and studied law at New York, N. Y., and was admitted to practice. When the war with England broke out in 1812, he was a lieutenant in a military company belonging to Troy, and was stationed at French Mills, now Fort Covington. On the night of Oct. 22, 1812, he was sent with a detachment under command of Major Young to capture a party of Canadian militia posted at St. Regis. Lieut. Marcy led the attack, broke open the door of the blockhouse occupied by the Canadians, and when they surrendered received their arms. These were the first prisoners taken by the Americans on land, and their flag the first standard captured in the war. He remained in service till the close of hostilities. From 1816 to 1818 he was recorder of Troy. He then became editor of the Troy "Budget," a daily newspaper, which he soon made a leading organ of the democratic party. In January, 1821, he was appointed adjutant general of the state militia; and in February, 1823, he was elected by the legislature comptroller of the state, when he removed to Albany. In 1829 he was appointed an associate justice of the New York supreme court, which office he held till Feb. 1, 1831, when he was elected United States senator. During his term he was chairman of the committee on the judiciary. In 1832 he was elected governor of New York, and resigned his senatorship. He was re-elected in 1834, and again in 1836, but was defeated by Mr. Seward in the election of 1838. He was appointed by President Van Buren one of the commissioners to decide upon the claims of the Mexican government under the convention of April, 1839, and performed the duties of this office till 1842. In 1845 President Polk appointed him secretary of war, a post whose duties were made peculiarly difficult and responsible by the breaking out of the war with Mexico in the spring of 1846. As a member of President Polk's cabinet his diplomatic powers were exerted to advantage in the settlement of the Oregon boundary dispute with England,
and his abilities as a statesman were called into requisition upon many other questions. In March, 1853, he was appointed by President Pierce secretary of state, and in the latter part of that year he greatly distinguished himself at home and abroad by his correspondence with the Austrian government on the subject of the release of Martin Kosza by Capt. Ingraham of the United States navy. (See Ingraham, Duncan Nathaniel.) Besides his Kosza letter, his state papers on Central American affairs, on the enlistment question, on the Danish Sound dues, and on many other topics of national interest, exhibited his remarkable ability as a writer, statesman, and diplomatist. He retired from office on the inauguration of Mr. Buchanan, March 4, 1857, and just four months later died suddenly while lying on his bed reading. He left a reputation among his countrymen of all parties as a statesman of the highest order of abilities.

MARDIN, a town of Asiatic Turkey, in the vilayet of Diarbekir, 350 m. N. W. of Bagdad; pop. about 12,000. It is situated on a rocky eminence, more than 2,000 ft. above the level of the sea. Near it is a Jacobite monastery, said to have a large library, containing works in 12 different languages. The town is the seat of a United Syrian and a Chaldean bishop, and of a flourishing Protestant mission. It has several mosques and churches, and manufactories of linen, cotton, and leather.

MAREME (sing. maremma, a salt marsh), tracts of marshy country in some parts of middle Italy, on the Mediterranean coasts, especially from the mouth of the Cecina to Orbetello, which are extremely unhealthy from midsummer to the middle of autumn. During this period it is dangerous to spend even a single night in the Maremma; those who do so are almost surely attacked by fever. There is nothing apparent in the air, either to sight or smell, to account for this insalubrity; on the contrary, the atmosphere seems to be remarkably clear and pure. The malaria does not proceed from the water of the marshes, for it is equally virulent on dry elevations, and has been attributed to unhealthy exhalations of sulphur and alum in the soil. In ancient times the Campagna di Roma, which is now almost deserted in consequence of the malaria, was cultivated like a garden, and was the seat of a dense population. The city of Rome itself has been invaded by the mephitic air, and the malicious fever prevails in some of the streets. The Maremma, in different basins, occupy altogether an area of nearly 1,000 sq. m. Of late years efforts, which to some extent have been successful, have been made to redeem the marshes by drainage, banking in the lakes, planting trees, and bringing the ground into tillage.

MARENO, Carlo, an Italian dramatist, born at Cassolo, Piedmont, May 1, 1800, died in Savona, Sept. 20, 1848. He took his degree in jurisprudence at Turin in 1818, but became famous in 1828 by his drama, Bondelmonte. His Famiglia Foscari is especially admired. He spent most of his life at Ceva, excepting shortly before his death, when the government appointed him to a public office at Savona. His posthumous Tragedie inediti, edited by G. Prati (Florence, 1856), contain several poems.

MARENGO, a W. county of Alabama, bounded W. by the Tombigbee river, which unites with the Black Warrior on the N. W.; area, 975 sq. m.; pop. in 1870, 26,151, of whom 20,058 were colored. It has a nearly level surface; the soil is very fertile, and a tract known as the "Canebrake" is among the most productive cotton land in the south. The chief productions in 1870 were 598,938 bushels of Indian corn, 38,691 of sweet potatoes, 164,981 lbs. of butter, and 23,614 bales of cotton. There were 1,877 horses, 3,629 mules and ass, 4,116 milch cows, 8,315 other cattle, 1,703 sheep, and 16,581 swine. Capital, Linden.

MARENGO, a village of Piedmont, Italy, on the river Bormida, 3 m. S. E. of Alessandria, situated on an extensive plain of the same name, where a victory was gained by Bonaparte over the Austrian general Melas, June 14, 1800. Bonaparte, having crossed the Great St. Bernard in the latter part of May and run a large portion of Lombardy, entered the plain of Marengo with the object of preventing Melas, who had concentrated his forces at Alessandria, from escaping him by a march southward to Genoa. On the morning of June 14 the village of Marengo was occupied by two French divisions under Victor. Melas attacked them with 31,000 men and 200 cannon, and at 11 o'clock, when Bonaparte arrived, Victor's divisions with Lannes's corps were in full retreat. The fugitives, reanimated by the presence of Bonaparte, rallied and kept the Austrians in check. At 4 P.M. Desaix's corps, which was on the road to Novi, and had been hurriedly recalled, arrived on the field and took position on the left, while Victor and Lannes reformed on the right, with Marmont's masked battery in the rear. Thus reinforced, Bonaparte turned the tide and completely over-thwhelmed the Austrians, the younger Keller-mann's cavalry charge deciding the day. The Austrians lost 7,000 killed and wounded, 3,000 prisoners, 20 pieces of artillery, and 8 standards. The French, who brought about 28,000 men into the field, lost about 7,000 in killed (including Desaix) and wounded and 1,000 prisoners. An armistice followed, by the terms of which the Austrians were allowed to retire beyond the Mincio on condition of giving up all their fortified places in Italy west of that river.

MARENZIO, Luca, an Italian composer, born near Brescia about 1550, died Aug. 22, 1590. His parents were poor, and he received instruction from the parish priest and the chapelmaster at Brescia. His first collection of madrigals brought him into notice, and he was engaged in the service of the king of Poland.
The climate of the north being too severe for him, he returned to Italy and entered the service of Cardinal d'Este, and later of Cardinal Aldobrandini as chapelmaster. In 1595 he was admitted to the college of precentors of the pontifical chapel. He is considered as one of the greatest composers of the 16th century, and was surnamed il più dolece cigno, "the sweet swan," and "the divine composer." He gave himself almost wholly to the composition of madrigals for four, five, and six voices; but in these, of which he wrote a great number, he displayed an invention, grace, and skill that won for him universal admiration.

MAREOTIS (Arab. Birket el-Maryoot), a lake in Lower Egypt, S. E. of Alexandria, whose southern walls it once washed; length nearly 40 m., breadth 15 m., depth from 4 to 14 ft. It is separated from the Mediterranean on the west by the narrow neck of land on which Alexandria is situated. In former times its connection by canal with the Rosetta branch of the Nile, and with the sea at Port Eunosta, the old harbor of Alexandria, made it available for inland navigation, and its shores were covered with vineyards and gardens. With the decay of Alexandria the canal was neglected, and the lake, ceasing to receive the Nile waters, gradually dried up. In 1801 the British, then besieging the French in Alexandria, cut the narrow isthmus separating the lakes of Mareotis and Aboukir, and the sea water flowing in filled the bed of the lake. Mehemet Ali re-established the isthmus by filling up the channel cut by the British, and restored the canal connecting with the Rosetta branch of the Nile at Fua.

MARECH, J. A., a Russian horn player, born in Bohemia in 1709, died in St. Petersburg in 1794. In 1744 he entered the Russian imperial service, where his talent was noticed by Prince Narishkin, under whose direction he set about the improvement of the Russian horns. The instruments of this class then in use were very inferior in construction, giving but one tone. He made 37 of these, giving all the tones and semi-tones comprised within three octaves. The horn producing the lowest tone was 7 ft. in length, that producing the highest, one foot. He distributed these 37 horns to as many men, and by severe drilling enabled them to execute the most difficult and rapid passages. Each performer waited for the proper instant for him to sound his particular note with the necessary degree of force. The first trial of this singular music was made in 1755 in presence of the imperial court at Ismailov, near Moscow. Maresch was munificently recompensed for the astonishing results which he obtained.

MARET, Henri Louis Charles, a French theologian, born at Meyrueis, Lôzère, April 29, 1805. He was ordained in 1830, appointed to a charge in Paris in 1832, and in 1839 published Essai sur le panthéisme dans les sociétés modernes, which brought him prominently before the public. In 1840 he was appointed professor of dogmatic theology in the Sorbonne, and honorary canon of Notre Dame. In 1844 he published the result of his lectures at the Sorbonne under the title of Théodicée chrétienne, which was a parallel between the Christian and the rationalistic notion of God. In 1849 he was appointed vicar general of Paris, and in 1855 dean of the faculty of theology. His philosophie et religion (1856) has been translated into several languages. He was 1860 nominated by the government bishop of Vannes, but on account of his Gallican opinions he was not confirmed by the pope; and in 1861 he was consecrated bishop of Sura in partibus infidelium, and appointed by the emperor a member of the imperial chapter of St. Denis. In 1869, before the opening of the Vatican council, he published Du concile général et de la paix religieuse (2 vols. 8vo), which was translated into German and Italian. This work was assailed by the Unisers, as well as by Arch-bishop Manning, to whose arguments Bishop Maret replied in Essai de philosophie et de religion (2 vols. 8vo). At the council he voted with the opposition; but in September, 1871, he wrote to the pope to express his acceptance of the decree of infallibility, and his regret for everything which he had written against it. His other principal works are: L'Église et la société laique (1840), and L'Anti-christianisme (1864). When Lacroix in 1848 founded L'Ére Nouvelle, he placed it under the direction of M. Maret.

MARET, Hugues Bernard. See Bassano.

MAREY, Étienne Jules, a French physiologist, born in Beune in 1830. He took his medical degree in Paris in 1860, subsequently lectured on the circulation of the blood, and in 1867 succeeded Flourens as adjunct professor of natural history at the college de France. His principal works are: Tableau sommaire des appareils et expériences cardiaques de M. Chauve and Marey (Paris, 1863), and Du mouvement dans les fonctions de la vie (1867). His experimental researches on the movements of animals are also of great originality and excellence. His latest book is La machine animale: Locomotion terrestre et aérienne (Paris, 1873), of which the English translation ("Animal Mechanism, a Treatise on Terrestrial and Aerial Locomotion." New York, 1874) forms vol. xi. of the "International Scientific Series."
MARGARET, titular queen of Navarre, or MARGARET OF ANGOULÈME, born in Angoulême, April 11, 1493, died at the château of Oslos, in Bigorre, Dec. 21, 1549. She was the daughter and eldest child of Charles of Orleans, count of Angoulême, and of Louise of Savoy. Her father died when she was in her 12th year, and she was educated by her mother at the court of Louis XII. She was married in 1509 to Charles, duke of Alençon, a prince of the blood royal, and the five years immediately following were passed in the duchy of Alençon; but on the accession of her brother to the throne of France as Francis I. (1515), she became attached to his court, and had a large part in the government. She was superior to her brother in ability, spoke several languages fluently, and her learning and wit made her the fit companion of the statesmen of those times. After the defeat and capture of her brother at Pavia, in February, 1525, Margaret aided her mother to carry on the government for some months; but in August she went to Madrid, where Francis was then a prisoner. During this visit she was efficient in negotiating the treaty of January, 1526, which eventually led in 1530 to the marriage between Francis and Eleanor, sister of the emperor, and queen dowager of Portugal. The duke of Alençon, her husband, died in 1525, and in January, 1527, she became the wife of Henri d'Albret, count of Béarn and titular king of Navarre, whose kingdom was held by Spain. Francis, besides bestowing a liberal portion on Margaret, pledged himself to effect the restoration of her husband to the throne of Navarre, for which Margaret, as her correspondence shows, was anxious; but circumstances baffled his purpose. In 1529 she and her husband retired to the principality of Béarn, where they labored with success for the improvement of the people; and Margaret also paid much attention to the government of her duchy of Alençon. She sympathized with the reformers, several of whose leaders, and especially Calvin, were protected by her in Béarn against their persecutors. How far she favored the new doctrines is unknown, and it has been asserted by adherents of the old faith that she admitted, some time before her death, that she had been in error, and when dying declared that what she had done for the reformers was more from compassion for them than from ill will to Rome. It is certain, however, that the zealous Catholics regarded her as a heretic, and that one of her works, Le miroir de l'âme pêcheresse (1538), contains Protestant doctrines. The Sorbonne censured it, and it was denounced in other ways. Francis was told that if he wished to destroy the heretics, he must begin with the queen his sister; but he never would allow her to be injured, and punished some of those by whom she had been insulted, or who had sought to poison his mind against her. Margaret was a voluminous writer in verse and prose, and one of her works, the Heptaméron, is an old French classic. It was published in Paris in 1550 (best ed., 1868), and has been translated into English by W. K. Kelly (London, 1835). It is written in imitation of the Decameron of Boccaccio, but was left incomplete at her death, as it contains but 72 tales, instead of 100 as originally intended. It is so far an original work, that most of the adventures described befell some of the author's contemporaries. She wrote many poems, dramas, poetical epistles, rondaux, and the like, several of which have been printed, while others remain in manuscript. Her letters to her brother Francis were published in Paris, from the originals, in 1842. On the death of Francis I. (1547) Margaret, who was much afflicted by his loss, became devout, passed most of her time in seclusion, and solaced her mind with religious thoughts and literary pursuits. Her daughter, Jeanne d'Albret, who married Antoine de Bourbon, became the mother of Henry of Navarre, afterward Henry IV. of France, and founder of the royalty of the house of Bourbon. The best life of Margaret of Navarre is that by Martha Walker Freer (2 vols., London, 1864).

MARGARET, queen and patron saint of Scotland, born in Hungary in 1046, died in Edinburgh, Nov. 17, 1093. She was the niece of Edward the Confessor, and daughter of Edward, son of Edmund Ironside, and of Agatha, daughter of the emperor Henry III. With her brother Edgar Atheling and her sister Christina she was reared at the court of Hungary till 1056, when she returned to England. She fled to Scotland in 1070 with Edgar, and was received at Dunfermline by King Malcolm Canmore, whose wife she became soon afterward. Margaret was gentle, pious, learned, and accomplished, and anxious to introduce among the people of Scotland a higher civilization. She enlightened her husband's mind and soothed his fierce spirit; invited the Scottish clergy and monks to a council, in which she prevailed on them to adopt the Roman manner of celebrating Easter; and put into practice several wise regulations for the instruction of their flocks. She also prevailed on the king to encourage commercial intercourse with other countries. She regulated the royal household, introducing the ceremonial of European courts. She was lavish in her charities to the poor, and founded a number of churches, working with her own hands for their embellishment. She bestowed her chief care on the education of her nine children, especially her six sons; the youngest, David I., was called by Buchanan "the perfect exemplar of a good king," and his sister, Queen Matilda or Maud, who founded London church, inherited all their mother's virtues. King Malcolm and Edward, his eldest son, having been slain before the walls of Alnwick, Nov. 13, 1093, the news of their death so affected the queen that she died four days afterward (though according to
some she lingered till June 10, 1094). She was canonized in 1251 by Innocent IV.; and Clement X. in 1673 made her the patron saint of Scotland. Her feast is celebrated on June 10. St. Margaret's chapel, built in her honor by David I., is still visited in the castle of Edinburgh. It was restored in 1853, and in the chancel are three stained-glass windows with portraits of the saint, Malcolm Cammore, and David I. The life of St. Margaret was written in Latin by her chaplain and confessor, Theodoric or Thierry, a monk of Durham; in French by Lefebvre (Douai, 1660); and by the Bollandists in Acta Sanctorum.—*St. Margaret's cup" or "draught" was a custom introduced by her into the Scottish court for the purpose of repressing drunkenness, and consisted in her filling with her own hand a cup of choice wine, of which all partook, with the promise to drink no more. After this grace was said. This custom became general in Great Britain, Flanders, and Germany, several popes attaching an indulgence to the "grace cup" on condition that it should be the last for that day. This was especially observed by guilds and brotherhoods at their yearly banquets, and many of these indulged cups, called "payers," are still preserved.

MARGARET OF ANJOU, queen of England, daughter of René, duke of Lorraine and count of Provence, and titular king of Sicily and Jerusalem, and of Isabella of Lorraine, born at Pont-à-Monsson, March 23, 1429, died at the château of Dampierre, Aug. 25, 1481. Her childhood was passed, amid the troubles that befell her family, in Italy, France, and Lorraine. Her hand was sought by the count de St. Pol and by the count de Nevers. Report of her beauty having reached Henry VI. of England, from a gentleman of Anjou, who acted under the inspiration of Cardinal Beaufort, her portrait was obtained for his inspection. This decided the king's action, and commissioners were appointed to negotiate a truce with France and Burgundy. Charles VII. favored the marriage, with the view of making it the basis of peace. Not only was no dowry asked with Margaret, but England ceded Anjou and Maine to René, who claimed them as his hereditary dominions. The war party in England, headed by the duke of Gloucester, opposed both the peace and the marriage, but the Beaufort party proved victorious; and Suffolk, who was elevated to a marquisate, married Margaret as Henry's proxy at Nante, November, 1444. Margaret did not reach England until the next April, when her marriage took place in Titchfield Abbey. In 1447 occurred the death of the duke of Gloucester, of which she has been accused by some historians. She soon became unpopular, and the English connected the loss of their French possessions with her marriage. The York family, taking advantage of the weakness of the king, aimed to obtain the crown, which belonged to their chief by the law of descent. Margaret's only child, Edward, born Oct. 13, 1453, was said by her enemies to be either the offspring of adultery or a supposititious child. Prince Edward was born while his father was suffering from one of his fits of imbecility, and when the queen was at the head of the government. The duke of York was made protector, but on the restoration of the king's health he was dismissed, whereupon he asserted his right by an appeal to arms, and the Yorkists won the first battle of St. Albans, which restored them to power. Parliament ensured the queen and her friends, but in 1456 Henry assumed his rights, and the government was virtually in Margaret's hands. Personal ill feeling between the queen and the earl of Warwick, the most powerful of the Yorkist leaders, caused a renewal of the war, and the Lancastrians were at first victorious; but the Yorkists rallied, defeated their foes, and obtained possession of the person of the king, who recognized York as his successor. Margaret fled with her son, first to Wales, and thence to Scotland. Receiving assistance from the Scotch, she returned to England, and was joined by her supporters in the northern counties. York was advanced to oppose her, and was defeated and slain at Wakefield. Marching to London, she defeated Warwick in the second battle of St. Albans, and released her husband. The Londoners would not admit her into their city, but recognized York's eldest son as king, by the title of Edward IV. She retreated north, and was followed by Edward. After the fatal battle of Towton, March 29, 1461, Margaret fled to Scotland with her husband and son. Thence she went to France, in the hope of obtaining aid from Louis XI., in which she met with little success. Pierre de Brezé, seneschal, was advanced to oppose her, and by his aid she landed in England, but accomplished nothing, and returned to Scotland. There she raised forces and invaded England, and at first obtained some successes, but was defeated in the battle of Hexham, in 1464. She returned again to Scotland, and afterward went to Flanders. After remaining some time at Bruges, she took up her residence in her father's dominions, where she superintended her son's education, aided by Sir John Fortescue. She visited the French court, at Tours, in 1469; and it was under the mediation of Louis XI., that a reconciliation between her and the earl of Warwick was effected in 1470, the earl having broken with Edward IV. and fled from England. The earl's youngest daughter, Anne Neville, was betrothed to the queen's son, Edward of Lancaster. Warwick returned to England and marched to London; the Lancastrians were for the time triumphant; Edward IV. fled to the continent, and Henry VI. regained the throne. Margaret prepared to return to England, but contrary winds delayed her purpose, and it was not till April 14, 1471, that she landed at Weymouth, accompanied by her son. Warwick, however, had been defeated.
and slain on the same day in the battle of Barnet, and the queen took sanctuary in Beaulieu abbey. Some of the Lancastrian leaders, who had a strong force, induced her to join them; and while seeking to effect a junction with their friends in Wales, they were assaulted and defeated at Tewkesbury, May 4, 1471, by Edward IV. Margaret fell into the hands of the victor, her son having previously been slain. Her husband was put to death a few weeks later. She was imprisoned in the tower, and afterward at Windsor and at Wallingford, till Nov. 3, 1475, when she was ransomed by Louis XI., who paid 50,000 crowns for her liberty, her father having ceded Provence to him for the purpose. She formally renounced all the rights her English marriage had given her, and resided in deep seclusion at Reculée, near Angers, one of the possessions of her father, seldom leaving that retreat. Her last days were passed in the château of Dampierre, to the lord of which her father at his death had consigned her.—See "Life and Times of Margaret of Anjou," by Mary Ann Hookham (2 vols., London, 1873).

MARGARET OF AUSTRIA, daughter of Maximilian I., emperor of Germany, and of Mary of Burgundy, born in the Low Countries, Jan. 10, 1480, died there, Dec. 1, 1539. Before she was three years old she was, by the treaty of Arras, concluded between her father and Louis XI. of France, affianced to the dauphin, with a large territorial dowry. To prepare her for her future station, she was educated at the French court; but Charles VIII. broke the contract, and returned her to her father, in order that he might wed Anne of Brittany, whom Maximilian himself was seeking in marriage. This gross insult, which happened in 1491, was never forgotten by the house of Austria. In 1495 a treaty of alliance was made between Maximilian and Ferdinand and Isabella, one of the terms of which was that John, prince of the Asturias, and heir apparent of the Spanish sovereigns, should marry Margaret. Sailing for Spain in winter, the weather was so stormy that many of the vessels composing the fleet were wrecked, and that which bore the princess was in great danger of being lost; but she was so cool that she wrote her own epitaph:

"C'est Margot, la gentil' damoisselle
Qu'a deux marts, et encore est pucelle."

Landing in Spain in March, 1497, Margaret was married to Prince John on April 3. Their union was of brief endurance, as John died of fever on Oct. 4. In a few months Margaret gave birth to a still-born child, and in 1499 she returned to the Netherlands. In 1501 she married Philipibert the Fair, duke of Savoy, who died without issue in 1504. On the death of her brother Philip in 1506, she was made regent of the Netherlands by her father, and superintendent of the education of her nephew, the future emperor Charles V., and his sister Mary. She was an able ruler, and was concerned in some of the principal negotiations of that time, proving herself a vindictive enemy of France, and a zealous servant of the house of Austria. In connection with Louise of Savoy, mother of the king of France, she negotiated the treaty of Cambray, in 1529, between Francis I. and Charles V., which was called the "ladies' peace," the terms of which were most humiliating to the French. Throughout her life she showed a fondness for literary pursuits, and wrote well in prose and verse.

MARGARET OF DENMARK, called the Semi-ramis of the North, the queen of the united kingdoms of Denmark, Sweden, and Norway, born in Copenhagen in 1535, died in Flensburg, Oct. 28, 1412. She was the third daughter of Valdemar III., king of Denmark, and at the age of 10 was married to Haco, king of Norway. Upon the death in 1387 of Olaf, the offspring of this marriage, and the king of Denmark and Norway, she procured her election as queen of the former kingdom, and by skilful management soon after secured the crown of Norway. In 1388 the Swedes, who were oppressed by their king Albert, having offered her the throne of that kingdom, she defeated Albert, who after seven years' imprisonment was released on condition of formally resigning his crown. Thenceforth she reigned with absolute authority. When urged to secure an heir to her thrones by another marriage, she promised to designate a successor, and at the assembly of the estates of the three kingdoms at Calmar, in 1397, presented to the deputies her grand-nephew Eric as her appointed heir. On this occasion, by her eloquence and address, she procured the adoption of a fundamental law, called the "Union of Calmar," establishing a perpetual union of the three kingdoms. Eric was at the same time associated with her in the government. Although holding extreme opinions on the royal prerogative, Margaret was in the main a just, magnanimous, and successful sovereign.

MARGARET OF PARMA, regent of the Netherlands under Philip II. of Spain, born in Brussels in 1522, died at Ortona, Italy, in 1586. She was the natural daughter of Charles V. by Margaret van der Geest, a lady of a noble Flemish family in Oudenarde, and received an education suited to her rank in the household of Mary, queen dowager of Hungary. In 1556 she became the wife of Alessandro de' Medici, duke of Florence, a man of prolific habits, and her senior by about 12 years. Within a year of the marriage Alessandro was assassinated by his kinsman, Lorenzino de' Medici, and the young widow, upon reaching the age of 20, was united to Ottavio Farnese, then 18 years old, receiving as her dowry the duchies of Parma and Piacenza. Toward Farnese she entertained feelings of contempt. Her birth, her education, the undoubted capacity and training in the austere school of Italian politics, and above all her orthodoxy in matters of religion, suggested
her to Philip, when about to take his departure from the Netherlands in 1599, as a suitable person to fill the office of regent of that province. Her administration, which lasted eight years, and witnessed the opening scenes in the great revolt of the Netherlands, was mild and beneficial in comparison with those which followed. She left the Netherlands Dec. 30, 1567, was amply pensioned by Philip, and passed the remainder of her life chiefly in Italy. Her tastes, including her love for the chase, were masculine; and in personal appearance "she seemed," in the language of a contemporary historian, "like a man in petticoats," the illusion being heightened by a somewhat hairy chin and upper lip. She died of gout. Alexander Farnese, the great commander, was her son.

MARGARET OF VALOIS, queen of France, born at St. Germain, May 14, 1558, died in Paris, March 27, 1615. She was the daughter of Henry II. and of Catharine de' Medici, and was famous for beauty, talents, and profi-
gacy. The third duke of Guise, Henri de Lorraine, would have married her, although aware of her vices; but she desired a crown, and agreed to become the wife of Sebastian of Portugal, a union which was prevented by the influence of Spain. In August, 1572, she was married to the king of Navarre, afterward Henry IV. of France. Her mother, just before the massacre of St. Bartholomew, sought her consent to have her marriage with a heretic annulled, but this Margaret refused. There was no attachment between her and her husband, and she hated his religion. A short time after he left Paris in 1576 she was per-
mitted to join him in Béarn, where she remained five years, tolerating his infidelities, though he would not tolerate her religion. In 1581, on the invitation of her mother, she returned to the French court. There the profi-
gacy of her life drew upon her the condem-
nation of her brother, Henry III., who com-
pelled her to return to her husband, by whom she was received with bitter reproaches. She fled from him, and took up her residence at Agen, whence she made war on him as a here-
etic. That place being taken in 1585, she vain-
lly sought another asylum, and was seized and imprisioned in the fortress of Usson; but her arts made her mistress of the place, from which she drove the governor, and held it for 20 years. She became queen of France in 1589, on the death of Henry III.; but her hus-
band, even after his triumph in 1594, refused to restore her to freedom until she should renounce her rank, to which she would not consent until after the death of his mistress, Gabrielle d'Estrees. They were divorced in 1599, but she did not recover her liberty un-
til some years later. She visited the court in 1605, where she did homage to her suc-
cessor, Maria de' Medici. The remaining 10 years of her life were passed in Paris or its vicinity. Almost to her last days she led a

vicious life; but at length she fell into hypo-
chondria, and was terrified at the approach of death. She founded the convent of the Petits Augustins in Paris, and instructed the children of the choir in music. Her Mémoires (latest ed., Paris, 1860), written by herself, are valuable because of the details they contain of the last days of the line of Valois.

MARGARINE, and Margaric Acid. When olive oil is cooled down to 32° F. and submitted to pressure, a solid residuum is obtained, which, when more completely separated from the oily portion after cooling and slowly cooling to the temperature of 55° or 60° by a second pressing, is the substance formerly called margarine. It dissolves in about 400 times its weight of oil-
ing alcohol, and separates in pearly scales as the alcohol cools; whence its name, from Gr. μαργαρίτας, a pearl. It is also obtained from human fat, goose grease, and other fatty sub-
stances. When saponified it yields an acid in the form of white pearly scales or fine needles, called margaric acid. This, according to Heintz, is a compound of stearic and palmitic acids, into which it may be separated. The term margaric acid is now restricted to an artificially prepared fatty acid having the definite com-
position C18H30O02. This acid is produced by the action of potash on cyanide of cetyl (mar-
garonitrite). The margarine or margaric acid described by Chevreul in 1829 has been shown to be a compound of stearic acid and other fatty acids of lower melting point.

MARGARITA, Island of. See NUEVA SPAR.

MARGARITONE D'AREZZO, an Italian artist, born in Arezzo about 1236 (according to Worn-
um; about 1215 according to others), died there at the age of 77. He attained great celeb-
renity in Italy before the time of Cimabue. He executed many works in fresco and distemper in the churches and convents of Arezzo, in the Byzantine style, of which few remains are now to be seen. His "San Francesco," however, which Vasari calls one of his masterpieces, still exists, and bears his inscription. He was more celebrated as a sculptor than as a painter, and one of his chief works, a reclining statue of Pope Gregory X., is still preserved at Arezzo.

MARGATE, a seaport town of Kent, England, on the isle of Thanet, 15 m. N. E. of Canter-
bury, and 68 m. E. by S. of London; pop. in 1871, 12,054. The great source of prosperity is the visitors in summer, who occasionally number, it is said, 100,000.

MARGAY. See Ocelot.

MARGGRAVE, See MARGICK.

MARGRAVE, Philipp Konrad, a German theologian, born in Hildesheim, May 1, 1780, died in Berlin, May 31, 1846. He was educated at Göttingen, and in 1806 became professor extraordinaire of theology at Erlangen; in 1809 ordinary professor at Heidelberg; and in 1811 ordinary professor at Berlin, and pastor of the church of the Trinity. The first edition of his Grundlehren der christlichen Dogmatik, which was founded on the philosophy of Schel-
ling, appeared in 1819. The second revised edition (Berlin, 1827) was adapted to the Hel- 
gelian philosophy. Its most important his- 
torical work is the Geschichte der deutschen 
Reformation (4 vols., Berlin, 1816–34), which 
reproduces many documentary records. In 
his Christliche Symbolik (3 vols., Heidelberg, 
1810–14), and his Institutiones Symbolicae (8d 
ed., 1830), he took a historical and comparative 
rather than dogmatic view of the principal 
Christian creeds. The practical results of his 
aim to demonstrate the unity and harmony of 
the Scriptures, the church, and the reason 
appear in his Entwurf der praktischen Theologie 
(Berlin, 1837). He published several volumes 
of minor writings and sermons, was one of the 
editors of the works of Hegel, and was prom- 
inent in the controversies excited by the Sym- 
bolik of Möhler, and the mystical tendencies 
of Görres, both of whom he opposed.

M A R I A C H R I S T I N A, former queen dowager of 
Spain, born in Naples, April 27, 1806. Her fa- 
thers was Francis I., king of the Two Sicilies, 
and her mother Maria Isabella, daughter of Charles 
IV. of Spain. She became the fourth wife of 
Ferdinand VII. of Spain, Dec. 11, 1829, to 
the consternation of the Carlists, whose hope that 
the childlessness of the king would secure to 
his brother Don Carlos the succession to 
the throne was prostrated by the restoration 
on March 29, 1830, of the law by which the crown 
was made heritable by the female line. Maria 
Christina gave birth to a daughter, afterward 
Isabella II., on Oct. 10, 1880. In October, 1882, 
Maria Christina, at the request of the king, 
took the reins of government into her own 
hands, and courted popularity by promulgating 
a general amnesty two weeks afterward. The 
kings resumed the conduct of affairs in Decem- 
ber, but died Oct. 29, 1883. In his will he 
appointed Maria Christina regent and guar- 
dian of Isabella, and of a second daughter, 
Maria Louisa Fernanda, that she had borne to 
him in 1832, and who afterward became the 
wife of Antoine, duke of Montpensier, the 
youngest son of Louis Philippe. Maria Chris- 
tina assumed the regency Oct. 2, 1833. Hav- 
ing conceived a violent passion for Ferdinand 
Muñoz, a private soldier in the royal body 
guard, whose parents had a tobacco shop at 
Tarancen, where he was born, she married him 
secretly, Dec. 29, 1833. Meanwhile she lost 
ground with the people, partly on account of 
his subserviency to the moderado party and to 
France, to which policy she was instigated by 
his ministers Martinez de la Rosa and Toresen, 
but chiefly owing to her clandestine relations 
with Muñoz. The new charter granted by her 
was far from giving satisfaction to the prov- 
ine, which revolted. In the night of Aug. 
13, 1836, a detachment of the provincial mil- 
tia, led by exciliodos, entered her palace of 
La Granja near Madrid, and after being joined by a 
core of the garrison, the queen, whose 
rendered them powerless, they compelled the queen 
regent to dismiss her 
 ministers and swear to the constitution of 
1812; and a new constitution was promulgated in 
June, 1837. Her position, however, con- 
tinued precarious. The ministers, Zea Bermu- 
dez, Tereno, Martinez de la Rosa, and Istoriz, 
who were successively at the head of affairs, 
were unable to restore her popularity. This 
received the greatest blow from her decree, 
issued June 15, 1840, in obedience to French 
influence, which put an end to the old mu- 
icipal liberties of Spain. The people rushed 
to arms, and she abdicated on Oct. 12 in favor 
of Espartero as regent, and repaired to Paris. 
After the downfall of Espartero, she returned 
to Madrid in 1844, and on Oct. 13 she cele- 
brated her marriage with Muñoz in public, on 
which occasion she created him duke of Rian- 
zares. Though Isabella had been declared of 
age, she continued to intermeddle in public 
affairs till 1854, when she was expelled from 
Spain by a new revolutionary movement. 
She retired with her husband and their ten 
children to France, where she had purchased 
the chateau de La Malmaison, which she sold 
to Napoleon III. in 1861. She then removed 
to Paris, though residing part of the time 
at Beaumont lodge, near Windsor, England, 
which she subsequently sold to the Jesuits to 
be used as a college. In September, 1864, she 
returned to Madrid, where she remained till 
she was driven out with Isabella by the revolu- 
tion of September, 1868, when she went back 
to Paris, where she now resides. Her hus- 
bund Muñoz died near Havre, Sept. 12, 1873.

M A R I A I I . D A G L O R I A, queen of Portugal, 
born in Rio Janeiro, April 4, 1819, died in Lis- 
bon, Nov. 15, 1838. Her mother, a daughter of 
the emperor Francis I. of Austria, and her grand- 
father, John VI. of Portugal, both died in 1826, 
when her father succeeded as Pedro IV.; but 
having been made emperor of Brazil in 1822; 
Pedro I., he ceded the Portuguese throne to his 
infant daughter (May 2, 1829), whom he wished 
to marry his brother Dom Miguel. But the 
latter, having succeeded (Feb. 26, 1829) his 
sister the princess Maria as regent during 
his niece's minority, usurped the crown four 
months afterward, before the queen's arrival in 
Portugal. Her rights were not established un- 
til after his final overthrow through a protract- 
el civil war, and she was formally recognized 
as queen in September, 1834. In January, 
1855, she married Duke Augustus of Leuchten- 
berg, who died two months afterward. In 
the following year she became the wife of Prince 
Ferdinand of Saxe-Coburg, to whom she bore 
three sons (the late king Pedro V., the pres- 
tent king Luis I., and Prince Augustus) and 
two daughters. At the instigation of her dic- 
tatorial prime minister Costa-Cabral, she sub- 
stituted in 1842 the reactionary charter of 
1826 for the liberal constitution of 1820, which 
she had formally adopted in 1838; but Costa- 
Cabral and her other were overthrown by an inter- 
vention in 1844, and the deposi- 
tion of Maria was prevented only by foreign 
intervention. She discarded Saldanha in 1849.
to reappoint Costa-Cabral; and she insisted upon retaining his services despite his resignation in consequence of the adverse vote in the cortes in February, 1851, and consented to dispense with them only after Saldanha had set on foot a revolution for his rival's overthrow. Saldanha remained prime minister until after the queen's death.

**MARIA DE' MEDICI**, queen of France, daughter of Francis I., grand duke of Tuscany, and of the archduchess Johanna of Austria, born in Florence, April 29, 1573, died in Cologne, July 3, 1642. She was educated in utter seclusion, and knew nothing beyond the circle of the Florentine court, when, in 1599, her hand was asked for Henry IV. of France of her uncle, Ferdinand I., grand duke of Tuscany. Her marriage with Henry had been contemplated seven years before, though but for the interposition of Philip II. of Spain she would have married the duke of Parma. She was married in 1600, and in 1601 gave birth to the first dauphin who had been born since 1548, and who became Louis XIII. Maria had great cause to complain of the infidelities of her husband, and her domestic life was full of bickering. Henry refused to send her back to Italy, with her favorites the Concinis, by whom she was ruled. Her coronation did not take place till May 13, 1610, the day before her husband was assassinated. By the aid of the duke of Épernon, colonel-general of the French guard, she became regent. She got rid of the prime minister Sully, and soon her government became one of the worst ever known in France. The Concinis were put to death in 1617, and she was herself exiled to Blois, her son being the chief of her enemies. She was freed from her prison by Épernon, and a reconciliation was effected between her and Louis, chiefly through the aid of Richelieu, and by the same assistance Maria maintained her ascendency at court for some years. Becoming jealous of Richelieu, she sought to overthrow his power, but was defeated and imprisoned in 1631. Escaping to the Netherlands, she remained there till 1638, and was concerned in many intrigues against the government of Richelieu. She then went to England, where her daughter Henrietta Maria was queen. Charles I., unsuccessfully endeavored to prevail upon the French government to allow her to return to France; and she became so unpopular in England that the long parliament requested her to leave the kingdom. She departed in August, 1641, parliament giving her £8,000, and promising her £6,000 more. She went to Antwerp, and took up her residence in the house of Rubens, whose patron she had been. After residing there for some weeks, she was ordered to leave Antwerp, and to proceed to Cologne, where she arrived Oct. 12. Here she finally died in comparative destitution, in a squallor chamber.

**MARIA LOUISA**, second wife of Napoleon I. See Bonaparte, vol. iii., p. 47.

**MARIA THERESA**, a German empress, and queen of Hungary and Bohemia, born in Vienna, May 13, 1717, died there, Nov. 29, 1780.

**MARINA, Juan**, a Spanish historian, born in Talavera in 1556, died in Toledo, Feb. 6, 1623. He was educated at the university of Alcalá, and when 17 years of age joined the society of Jesus. In 1561 he was appointed professor of theology in the Jesuit college at Rome. He afterward lectured on divinity in Sicily and Paris, and finally retired to the Jesuit house in Toledo. Having been employed to examine the polyglot Bible, edited by Arias Montanus at Antwerp in 1589—72, which had been denounced to the inquisition, he returned a favorable opinion of it, which brought upon him the displeasure of his superiors. His arrangement of the *Index Expurgatorius* of 1564, and still more his work *De Rigo et Regia Institutione* (Toledo, 1599), in which he intimates that unrighteous kings and usurpers may be put to death, were also displeasing. In Paris, where Henry III. had been assassinated a few years before, the latter work was condemned to be burned by the common hangman. It aroused a violent controversy, and brought great popular odium upon the order to which Mariana belonged. In 1609 he published at Cologne "Seven Theological and Historical Treatises," of which, "On Mortality and Immortality" and *De Alteratione Monetum* (denouncing the falsification of the coinage by the king of Spain's ministers), were censured by the inquisition, and the author was subjected to imprisonment and penance. To the "History of Spain" he devoted the last 30 or 40 years of his life. It was published in Latin (1592—1609) and Spanish (1601; enlarged ed., 1625), and extends from the supposed peopling of Spain by Tubal, son of Japheth, to the accession of Charles V., with a summary of later events, down to 1621. The best edition is the 14th (2 vols. fol., Madrid, 1780). There is an English translation by Henry Stevens (London, 1699). Among his other works are *Sermo de Bracia in Vetum et Novum Testamentum* (Madrid, 1619), and *Discursus de Erroribus qui in Forma Hibernationis Societatis Jesu occurrient*, published after his death and of disputed authenticity (Bordeaux, 1625).

**MARIANA, a city of Brazil, in the province of Minas Geraes, between the rivers Caruço and Seminario, 170 m. N. by W. of Rio de Janeiro; pop. about 7,000. It is situated at an elevation of 3,000 ft. above the sea, between two mountains, that to the east, Itacolumi, being nearly 9,000 ft. high. There are two large squares, seven fountains, and a bridge of a single arch crossing a torrent which runs through the centre of the town. There are eight churches, including a cathedral, a hospital, court house, and prison. Outside the town are an episcopal palace and a seminary. The climate is temperate and salubrious. Mining and agriculture are the principal occupations of the inhabitants.**

**MARIANNE ISLES.** See LADRONEs.

**MARIA THERESA**, a German empress, and queen of Hungary and Bohemia, born in Vienna, May 13, 1717, died there, Nov. 29, 1780.
She was the daughter of the emperor Charles VI. of Hapsburg, whose principal aim during a long reign seemed to be to secure to his heiress the succession to all the hereditary dominions of his house. By ample cessions of territory to various princes of Europe, he finally attained a general acknowledgment, though not by the Bourbons, of the "pragmatic sanction;" and Maria Theresa, a princess of rare beauty and talents, received not only an education fitting her future condition, but was also early initiated into the secrets of state and admitted to the council of her father. In 1736 she was married to Francis Stephen of Lorraine, afterward grand duke of Tuscany, and eventually German emperor under the name of Francis I., who was always glad to leave affairs of state to his consort, while he employed himself in profitable private speculations. Charles died Oct. 20, 1740, and at once, in spite of the pragmatic sanction, claimant after claimant raised pretensions to the whole or parts of his possessions. The young princess saw herself surrounded by enemies. Frederick the Great of Prussia occupied Silesia; Charles Albert of Bavaria was elected emperor under the name of Charles VII.; Spain, Sardinia, and Augustus III. of Poland and Saxony threatened to enforce various claims by force of arms; and France, which had no rights of succession of its own, was ready to support those of others. George II. of England alone proved a faithful ally. At the diet of Presburg in 1741 she put herself and her infant son Joseph under the protection of the Hungarians, who promised to die for their "king" Maria Theresa; and their enthusiasm became a support powerful beyond all expectation. Frederick made peace at Breslau (1742), retaining Silesia, which he had conquered; but Charles VII. lost even his own dominion, Bavaria. This success of the Austrian arms, however, raised the apprehensions of Frederick, and the second Silesian war ensued (1744), France simultaneously declaring war against England. Louis XV. himself appeared on the field, and Marshal Saxe won battle after battle in the Netherlands; Frederick, too, was successful. Saxony, however, was now the ally of Maria Theresa. Charles VII. died soon after reentering his capital Munich, and his son and successor not only renounced all his claims, but also supported the election of Maria Theresa's husband to the imperial throne of Germany (1745). Frederick, confirmed in the possession of Silesia, made peace at Dresden (1745). The war against Spain and France was continued, Marshal Saxe being victorious at Fontenoy (1745), Raucoux (1746), and Lawfeldt (1747), while England was successful against the pretender, in the colonies, and on the seas. Elizabeth of Russia declaring for Maria Theresa, the war was terminated by the peace of Aix-la-Chapelle (1748). Austria ceding Parma, Piacenza, and Guastalla to Don Philip, prince of Spain, and some districts of the duchy of Milan to Sardinia. Maria Theresa now turned her principal attention to the internal affairs of her states. Following chiefly the advice of her minister Kaunitz, she introduced numerous reforms, organized the administration, alleviated the burdens of the peasantry, abolished torture, created various institutions of learning, promoted industry and trade, and, though a zealous Catholic herself, subjected the papal bulls to the placet regium. In regard to Hungary, she observed a mild but slowly denationalizing policy. The external diplomacy of Kaunitz was also active, and when he finally succeeded in gaining over with Mue de Pompadour the court of France, in addition to the alliance of Russia and the house of Saxony, Frederick sought and obtained the alliance of England, and the seven years' war began (1756), of which the Prussian monarch became the hero, Laudon and Daun being his most effective Austrian antagonists. The war extended to almost all parts of the world, from the coast of Coromandel to Canada, and nearly all powers partook in it. The double peace of Paris and Hubertsburg (1759) terminated it to the advantage of Prussia and England, Frederick remaining now undisputed master of Silesia. Two years later Francis I. died, and was succeeded in the empire by his son Joseph II., and in Tuscany by Leopold, their sister Marie Antoinette being afterward married to the future French king Louis XVI. Joseph, however, enjoyed in the hereditary states of his mother only the rights of a co-regent, though his influence generally prevailed in foreign affairs, as in the case of the annexation of Galicia at the first division of Poland (1772), and of Bokowina from Turkey (1777). The peace of Teschen (1779) terminated, according to the energetic decision of the old empress, the war of the Bavarian succession. A monument 60 ft. high, representing Maria Theresa surrounded by the principal statesmen of her time, is to be completed at Vienna in 1875. Her correspondence, comprising several previously unknown letters, has been published in French by Alfred von Arnet (3 vols., Paris, 1874).

MARIA-THERESIOPEL. See SÁBADKA.

MARIAZELL, a village in Styria, Austria, 55 m. S.W. of Vienna (pop. about 1,000), situated in a picturesque country, and celebrated for its shrine of the Virgin, which makes it the principal resort of pilgrims in the Austrian monachy. From May to September there are 80 great processions from different parts of Austria, and the number of pilgrims annually is estimated at 250,000.

MARICOPA, a central county of Arizona, bounded E. by New Mexico and S. by the Gila river, and intersected by the Salt river and other tributaries of the Gila; area, about 14,560 sq. m. It has been recently formed, and is not included in the census of 1870. The settlements are chiefly in the valley of Salt river, one of the largest and most productive in the territory. Irrigation is practised, the river supplying abundant water. The chief crops...
are wheat, barley, and Indian corn. The valley of the Gila also contains large tracts of land suited to agriculture, and the table lands and mountains adjacent furnish good pasture throughout the year. The E. portion is generally broken and mountainous, but is watered by a number of streams, and contains much timber. Gold, silver, copper, and lead exist in most of the mountain ranges. The Apaches have held possession of the greater portion of the county. Capital, Phoenix.

MARIE, Charles François Maximilien, a French mathematician, born in Paris, Jan. 1, 1819. He left the military school of Metz in 1841, and has since devoted himself to researches in the most abstruse parts of mathematical science. His methods were for a long time the subject of ridicule, notwithstanding they had been approved by M. Lamé and M. Poncelet. In 1858 M. Léonville gave him the use of the columns of his mathematical journal to discover his discoveries; and in 1863, after violent opposition, he was appointed an examiner in the polytechnic school. He has published *Leçons d'arithmétique* (Paris, 1860), and *Leçons d'algèbre* (1860), treating the theory of the quantities called imaginary, and *Questions sociales* (1869).

MARIE AMÉLIE, queen of the French, born at Caserta, near Naples, April 26, 1782, died at Claremont, near Windsor, England, March 24, 1806. Her father was Ferdinand I., king of the Two Sicilies, and her mother Carolina Maria, archduchess of Austria. Her brother succeeded to the throne of Naples, and her four sisters were respectively empress of Austria, grand duchess of Tuscany, queen of Sar- dinia, and queen of Spain. In 1798, when Naples was invaded by the French, she retired with her mother to Palermo. In June, 1800, she went to Vienna, and returned in 1802 to Naples, but renewed political outbreaks forced the royal family to return to Palermo. There she became acquainted in 1808 with Louis Philippe, whose wife she became, Nov. 25, 1809. She continued to reside at Palermo till the restoration called her husband to Paris in September, 1814. The events of the hundred days soon compelled her and her family to take refuge in England. She returned to France in 1817, and from that time to 1830 resided at Neully. Her legitimist tendencies led her to view with regret the revolution of 1830, and she manifested a repugnance, based on scruples, to Louis Philippe's acceptance of the crown. After his accession Marie Amélie devoted herself exclusively to domestic life, and was remarkable for her charities, accomplishments, and piety. In 1848 she implored Louis Philippe not to abdicate; but when further resistance was useless she accompanied him to Évreux, where for safety she separated from him, rejoined him at Honfleur, and accompanied him to Claremont, where she took the title of countess of Neully.—See *Vie de Marie Amélie, reine des Français*, by Trognon (Paris, 1871).
in perfect harmony, and to whom she bore four children. Louis XVI. humored and hon-ored her, while she, without deep feelings of love, never ceased to respect him. According to the best authorities, she led a virtuous life in the midst of vicious associations. But the saucy spirit of her race, which asserted itself occasionally despite her general urbanity, could not always be reconciled with her fondness for familiar intercourse and her desire to please. Shortly after she became queen she conceived a warm friendship for the princess de Lamballe, and insisted upon restoring for her benefit the office of superintendent of the queen's house-hold. This entailed additional expense, and gave offence to her former ladies in waiting, who resigned, while other ladies of the court declined to serve under the princess. At the same time she was on bad terms with her brother-in-law the count of Provence (after-ward Louis XVIII.), the prince de Condé, and the duke of Orleans, and she made bitter en-mies of many of the women of easy virtue who had flourished under Louis XV., and whom she discarded. Yet while following such examples, she was forbearing toward the fa-therings of some of her own favorites; and this want of consistency strengthened her enemies, who made every effort to injure her in public estimation. In this they succeeded, especially after the sensation produced by the affair of the necklace (1785), in which Marie Antoinette was scandalously implicated by the woman Lamotte and the cardinal de Rohan, and for which the two latter were imprisoned. (See LAMOTTE-VALOIS.) Nothing could be proved against Marie Antoinette, who exerted herself to alleviate the condition of the prisoner La-motte, whose husband, and she herself after-ward, overwhelmed the queen with deforma-tions. This affair became a convenient weapon in the hands of the queen's enemies. Her famous parties at the Trianon were described as orgies, and her fondness for private the-atricals and for unceremonial balls and amuse-ments became pretexts for atrocities callamiies. At the same time she was denounced as hos-tile to France, and as solely laboring in the interest of Austria. Ever since the birth of the first dauphin (1781) she had been charged, and not without some reason, with mixing her-self up too much with politics. But at length she was accused of being the cause of all the national and financial troubles; of having pro-cured vast sums for her brother, the emperor Joseph II.; of having helped the Polignac family to grow rich at the expense of the state; and of warmly supporting the administration of the unpopular Calonne, who gratified all her caprices, and whose influence became para-mount after the death of Vergennes (1787). Marie Antoinette was often admonished by her brother Joseph, as she had been by her mother, who were especially alarmed at her loss of prestige consequent upon her over-familiar in-tercourse with the Polignacs and other friends. Many sarcastic songs were circulated in Paris, in which she was held up to ridicule and opprobrium. Her opposition to the assembling of the notables for the consideration of the financial situation confirmed the popular pre-judices against her, and she was nicknamed Madame Déficit. The aid afforded to the American colonies, of which she was an enthusiastic advocate, had been an additional source of financial embarrassment. In fact, she wrote to one of her friends, April 8, 1787: "Dearly enough do we pay to-day for our rejoicing and enthusiasm over the Ameri-can war." Calonne was removed at her in-stigation, and replaced by Loménie de Bri-enne, archbishop of Toulouse, a prelate fond of theatricals and puerilities, and an especial favorite of the queen. She joined him in a strenuous opposition to Necker's suggestion of a convocation of the states general, which was taken up by Lafayette and by public opinion as the only alternative to revolution. But, frightened at the tumults in Paris and other places, she at last prevailed upon the prime minister to issue a decree (Aug. 8, 1788) for the meeting of the states general in May, 1789. The king continued to lead his placid life, while the queen controlled affairs of state. Loménie de Brienne having lost her confi-dence, she placed Necker at the head of the cabinet. But the outbreak of the political storm which was gathering round the mon-archy was accelerated by her want of earnest-ness and sincerity in the proposed creation of a third estate, which she regarded as a death-blow to the nobility and as a menace to the throne. At the opening of the states general, May 5, 1789, she was received in a manner which deeply offended her pride; and so low had she already sunk in public estimation that the habitual expression of sympathy on occas-sions of bereavement in the royal family were withheld by that body on the death of her first-born son, the dauphin, June 4, 1789. During the subsequent political developments the count de la Marche in vain appealed to her to come to an understanding with Mirabeau, to which she replied that her husband would probably never become so miserable as to be obliged to resort to such an expedient; but at a later period, when she in her turn in vain attempted to conciliate Mirabeau, she exclaimed that it was her destiny to make mischief. Appalled at the signs of the times, and at the detestation in which she was held by the populace, she led an uneasy life at the Trianon till Oct. 5, 1789, when that palace was invaded by the mob, from whose violence she only escaped by her own intrepidity. While she fully recognized the peril of the situation, the king consented to accompany the populace to Paris, a step which she regarded as fatal, and she very op-erably went with him and their children. Feeling that her unpopularity aggravated the difficulties of her husband's position, she now strove to remain in the background, but still
virtually continued to control affairs; and as some of her measures conflicted with those urged by the king's other advisers, many cross purposes increased the prevailing uncertainty and confusion. She was unable, and the king was too lethargic, to secure the cooperation of competent statesmen in building up a constitutional monarchy, which might perhaps have saved the throne. Despairing at last, she obtained Mirabeau's consent, shortly before his death, to the flight of the royal family, which ended so ignominiously (1791). During the insurrection of June 20, 1792, Madame Elisabeth, the devoted sister of the king, was mistaken for Marie Antoinette by the mob, who shouted "A bas l'Autrichienne." The people had long been made by her adversaries to believe that she was surrounded by a so-called Austrian cabinet, which was planning the ruin of France; and the mourning at the court over the death of Marie Antoinette's brother, the emperor Leopold, which began March 13, 1792, was jeered at and turned into public rejoicing. During the attack upon the Tuileries, June 20, she overawed the coarse women who came to insult her by her firm and noble attitude, which she also displayed on Aug. 10, when the palace was sacked, and she and her family took refuge in the national assembly, though she long declined to leave the Tuileries, imploiring the king rather to nail her to the walls of the palace. On Aug. 13 the royal family was removed to the Temple prison, where she was separated from her husband, and did not see him again till Jan. 20, 1793, the eve of his execution. In the night of Aug. 1-2, when she was removed to the Conciergerie, she took leave of Madame Elisabeth and of her daughter; and having long prepared herself for her inevitable fate, she bore all her agonies with stoical fortitude. Before the revolutionary tribunal (Oct. 14), she showed the same calmness and resignation. Instead of vindicating herself, as her husband had attempted to do, she hardly descended to reply, excepting in the most laconic manner, to the questions put to her; and she demonstrated by her attitude that she regarded the trial as a farce and her death sentence as a foregone conclusion. Only when she was accused by Hébert ("Père Duchesne"), the principal witness against her, of having debauched her own boy, who had slept in the same bed with her and Madame Elisabeth, her indignant denial of that accusation, and appeal to all the mothers present, struck conviction into the minds of the most obdurate. Even Fouquier-Tinville, the public prosecutor, and the most infuriated women seemed to sympathize for once with the unfortunate queen. The trial lasted two days. She insisted that nothing was proved against her, and that she had only done her duty as a wife in obeying her husband. She was found guilty of having conspired against France abroad and at home, and sentenced to death at 4 A.M., Oct. 16. She was then taken to a cell of condemned prisoners at the Conciergerie, where she immediately wrote a touching and spirited letter to Madame Elisabeth, which has been preserved. Girard, the metropolitan vicar, having been sent to her by the authorities to attend her last moments, he besought her to dedicate her life to God in expiation of her crimes; to which she replied that he should speak of her mistakes, but never of her crimes. Dressed in plain white, and having cut off her beautiful blonde hair with her own hands, she was conveyed to the guillotine like other victims, only that more than 30,000 soldiers were stationed in the streets, and that the cries of "Vive la république! A bas la tyrannie!" were incessant. She showed neither haughtiness nor humility in her bearing, stepped with firmness upon the scaffold, and her head fell at 12.15 P.M. Her remains were interred in the cemetery of the Madeleine, by the side of those of Louis XVI. In 1815 they were removed to the vaults of St. Denis.—The most faithful likeness of Marie Antoinette is the portrait by the Swedish painter Rosslin. It was also drawn by Mme. Vigée-Lebrun, who published souvenirs of the queen. See also "Mémoires sur la vie privée de Marie-Antoinette," by Mme. Campan (Paris, 1826); "Histoire de Marie-Antoinette," by Edmond and Jules de Goncourt (1859); "Marie Theres und Marie Antoinette: Ihr Brieftausch während der Jahre 1770-80" (Vienna, 1865), and Marie Antoinette, Joseph II. und Leopold II.: Ihr Brieftausch (Vienna, 1866), both by Alfred von Arneth. Arneth's "Correspondance de Marie-Thérèse" (3 vols., Paris, 1874) shows that Marie Antoinette was constantly watched by her mother, through secret agents, with a view of protecting her.

MARIENBAD, a watering place in Bohemia, 20 m. S. S. W. of Carlsbad, and 76 m. W. by S. of Prague; pop. about 1,000. It contains a number of mineral springs, beneficial for diseases of the chest, bowels, and skin, as well as for rheumatic complaints, and is annually visited by thousands of persons. The waters of some of the springs, particularly of the Kreuzbrunnen, are largely exported to foreign countries. The watering place is of comparatively recent origin, and was opened out of the forest which covered its site in 1810.

MARIENBURG, a town of Prussia, in the province of West Prussia, on the Nogat, 28 m. S. E. of Dantzig; pop. in 1871, 8,235. It has a gymnasium, a normal school, and an institution for the deaf and dumb. The castle, which was formerly the seat of the grand master of the Teutonic order, was restored in 1807-24. The town remained with the Teutonic order till 1457, when Poland took possession. In 1772 it was united with Prussia.

MARIENWERDER, a town of Prussia, capital of an administrative district in the province of
MARIETTE

West Prussia, on the Little Notz, 45 m. S. E. of Danzig; pop. in 1871, 7,173. It is one of the most beautiful towns of eastern Germany, has a large cathedral church, a gymnasium, a hospital for blind soldiers, and an ancient castle which is now used as a prison. The most important branches of industry are woollen cloth weaving, brewing, and distilling.

MARIETTA, a S. central county of Missouri, intersected by the Gasconade river; area, about 500 sq. m.; pop. in 1870, 5,916, of whom 22 were colored. The surface is broken and generally well timbered; the soil of the valleys is fertile, that of the uplands poor. Iron, lead, and copper are found. The chief productions in 1870 were 79,243 bushels of wheat, 1,63,479 of Indian corn, 72,075 of oats, 8,887 of potatoes, 17,672 lbs. of tobacco, 15,122 of wool, and 4,633 of butter. There were 2,720 horses, 466 mules and asses, 1,998 milch cows, 4,397 other cattle, 8,095 sheep, and 10,979 swine.

Capitol, Vienna.

MARIETTA, a city and the capital of Washington co., Ohio, at the confluence of the Ohio and Muskingum rivers, and at the terminus of the Marietta and Cincinnati and the Marietta, Pittsburgh, and Cleveland railroads, 85 m. E. S. E. of Columbus; pop. in 1850, 3,175; in 1860, 4,323; in 1870, 5,218. Including Harmar, which is part of the town, the population is over 7,000. It is regularly laid out, with wide streets and neatly built houses. On the site of the city there is a remarkable group of ancient works, which are described in Squier and Davis's "Ancient Monuments of the Mississippi Valley" as consisting of "two irregular squares (one containing 40 acres area, the other about 20 acres), in connection with a graded or covered way, and sundry mounds and truncated pyramids. The town of Marietta is laid out over them, and, in the progress of improvement, the walls have been considerably reduced and otherwise much obliterated; yet the outlines of the entire works may still be traced. The walls of the principal square, where they remain undisturbed, are now between 5 and 6 ft. high by 20 or 30 ft. base; those of the smaller enclosure are somewhat less. The entrances or gateways at the sides of the latter are each covered by a small mound placed interior to the embankment; at the corners the gateways are in line with it. The larger work is destitute of this feature, unless we class as such an interior crescent wall covering the entrance at its southern angle." Marietta has considerable trade in petroleum, which is obtained in the vicinity, and contains several iron founderies, manufactories of buckets, chairs, etc., a union bank, and two national banks. It is the seat of Marietta college, the grounds of which occupy a square, and contain four buildings. This institution was established in 1835, and in 1873-4 had 11 professors and instructors, 182 students (93 in the collegiate and the rest in the preparatory department), 360 alumni, and libraries containing 25,000 volumes. The city has flourishing graded schools, including a high school, three weekly newspapers (one German), and 15 churches. Marietta is the oldest town in the state, having been settled in 1788 by New Englanders under Gen. R. Putnam, and named in honor of Marie Antoinette.

MARIETTE, Auguste Édouard, a French Egyptologist, born in Boulogne, Feb. 11, 1821. He was educated at the college of Boulogne, in which he was subsequently a teacher of grammar and of drawing. He early became interested in antiquities, and his first publication, Lettres à M. Bouillet (Paris, 1847), was a dissertation on the names of the cities that had formerly occupied the site of Boulogne. Egyptian hieroglyphics attracted his attention, and by the aid of books he became so well versed in Egyptology that he was appointed in 1848 to a situation in the Egyptian museum in the Louvre; and in 1850, at the recommendation of the institute, he was sent by the government on a scientific mission to Egypt. There his attention was chiefly directed to the remains of Memphis, and his excavations led to most important discoveries. Among these is the discovery of the Serapeum, close by the three great pyramids, and the first of the temples of Memphis disinterred. M. Mariette told Mr. Bayard Taylor, who visited him at the scene of his explorations in 1851, that an inscription which he found on one of the blocks quarried out of a mound near Mitrahennah induced him to believe that the principal part of the city lay to the westward, and accordingly he began to sink his pits four miles from the spot which archæologists had fixed upon as the site of Memphis. He soon struck upon an avenue of sphinxes, which led to the Serapeum or temple of Serapis mentioned by Strabo, an enormous structure of granite and alabaster, containing within its enclosure the sarcophagi of the bulls of Apis from the 19th dynasty to the time of the Roman supremacy. He found also 2,000 sphinxes, between 4,000 and 5,000 statues, reliefs, and inscriptions, eight colossal statues, evidently the product of Grecian art, and streets, colonnades, public and private edifices, and other marks of a great city. Subsequently he discovered an entrance to the great sphinx at Gizeh, and the clearing away of the sand at the base has left no doubt that this monument was sculptured from the immense rock which forms its foundation. On his return home, he was in 1855 appointed assistant conservator of the Egyptian museum in the Louvre, and in the same year sent to study Egyptian antiquities in the museum at Berlin. Having returned to Egypt, he was made by the viceroy director of the department for the preservation of Egyptian antiquities, with the title of bey, and an annual allowance for the prosecution of his researches. Among his later excavations, resulting in interesting and important discoveries, are those at Tanis, disclosing the monuments of the
kings of the shepherd dynasty, and at Thebes and elsewhere of monuments and inscriptions which explain the genealogy and chronology of different dynasties. In 1860 he discovered at Thebes the mummy of Queen Aah-hotep, of the 18th dynasty, and her jewels, consisting of a long gold chain, a diadem with two golden sphinxes, a breastplate of open work, a richly chased dagger, bracelets, earrings, and other ornaments, all of exquisite workmanship. These were shown in the Paris exhibition of 1867, and are now spoken of as “the pride of the museum of Bookal.” This museum is temporarily located, and is to be removed to Cairo. In April, 1874, Bayard Taylor again visited Mariette, and described his collections, which are arranged in the Bookal museum according to their civil or religious character, those of the earlier dynasties having the most conspicuous place. Three statues in the court belong to the age of the shepherd kings. The main vestibule is crowded with relics of the oldest Egyptian art. In the main hall are wooden statues belonging to the 4th dynasty, two painted limestone statues belonging to the 8th, and a granite statue of Cephen, the builder of the second pyramid, found by Mariette in a well in the granite temple discovered in 1866 near the sphinx. Even more interesting is the vast collection of furniture, household articles, implements of trade, glass and earthen ware, &c., revealing the civilization and domestic life of Egypt 4,000 years ago. In this museum is also the trilingual Canopic stone discovered at Tanis in 1866 by Lepsius, Reinisch, and Rössler. Mariette’s discoveries thus far have thrown comparatively little light upon the sojourn of the Israelites in Egypt, though they have afforded grounds for many probable chronological conjectures; but the revelations of the earliest periods resulting from his researches are of great value. He has published Mémoire sur la mère d’Apis (1856); Aperçu de l’histoire d’Egypte (1869); Nouvelle table d’Abydos (1863); Le Sépulcre de Memphis (in 9 parts, fol., with 110 plates, 1857–64); and Feuilles exécutées en Egypte, en Nubie et au Sou laden d’après les ordres du viceroy d’Egypte (fol., 1867). The Nouvelle table d’Abydos gives an account of the discovery of a more perfect tablet than the one formerly found in Abydos and preserved in the British museum. This second tablet supplies nearly all the vacancies which occur by mutilation in the first, and furnishes a list of kings of the first six dynasties, nearly as complete as Manetho’s, and corroborating the list of that historian. For the importance of Mariette’s discoveries, historically and chronologically considered, see Lenormant and Chevalier, Manuel d’histoire ancienne de l’Orient (3 vols., Paris, 1868–9; English edition, 2 vols., 1869–70).

**MARIGNANO, or Marignana.** See MELEGGANO. **MARIGOLD,** the usual name of garden plants of two distinct genera of *composita.* The old naturalists called them Mary Gowlows, a name from the Anglo-Saxon for another plant, which has been transferred to these, probably on account of a similarity in color. The garden or pot marigold, *calendula officinalis,* a spreading plant about a foot high with succulent oblong, entire, strong-smelling leaves, is still to be found in country gardens; the heads have numerous ray flowers, and these are the only ones that produce seed, which are in long, curved, roughened achenes; the disk flowers as well as those of the ray are yellow; the flowers have been rendered double in cultivation. The common marigold was once used in cookery, imparting a flavor to soups and broths, and thus has long had a place in the kitchen garden. It was formerly, among other uses, employed as a carminative; and its dried florets were used to adulterate saffron, and by dairy maids to impart a rich color to their cheese and butter. There are lemon-colored varieties, but the usual color is a rich orange yellow.

—The showy plants known in gardens as the African and French marigolds belong to the genus *tagetes,* and, notwithstanding their geographical garden names, are natives of South America and Mexico; they are annuals, with mostly pinnate leaves and heads of yellow, orange, or brownish flowers, with a smooth cup-shaped involucre; the ray flowers only are pistillate, but in most of the garden forms they are double by the conversion of the disk flowers into ligulate ones like those of the ray. The so-called African marigold (*T. erecta*) has large flowers varying from lemon color to orange. It is showy, but a much coarser plant than the French (*T. patula*), which has more delicate leaves, and flowers varying from pale yellow to a rich orange brown, often handsomely striped or bordered with different shades. The most beautiful and delicate of all is the comparatively recent *tagetes signata,* with very finely divided foliage of a rich deep bluish green color, and producing a great profusion of small single flowers, with five orange-colored rays which are marked with a dark spot at the base; a dwarf form of this, *var. pumila,* is a fine plant grown as a single specimen, and it is useful in masses. The foliage of the species before mentioned has a strong and unpleasant odor, but there is a sweet-scented one, *T. lucida,* the leaves of which have the odor of anise; its flower heads are very small and borne in clusters; it is much less cultivated than formerly, and though a perennial is treat-
ed as an annual. The different sorts are readily raised from seeds, sowing in June in the open ground, or earlier in hotbeds, and trans-planting when 3 or 4 in. high.—On the alluvial banks of rivers, from Illinois southward, is an American plant belonging to this group, known as the fetid marigold (*Alyssum chrysanthemoides*), furnished with pellucid glands, which give out a strong odor; the flower heads are terminal and the flowers yellow. The marsh marigold (*Caltha palustris*) belongs to the order Ranunculaceae.

**MARIN**

A W. county of California, bounded E. by the bays of San Pablo and San Francisco, and S. and W. by the Pacific ocean; area, 570 sq. m.; pop. in 1870, 6,908, of whom 361 were Chinese. The surface is rugged and mountainous, and only a small portion of the soil is adapted for cultivation, though much of it is well suited for grazing. The valleys are highly productive. It is intersected by the San Francisco and North Pacific railroad. The chief productions in 1870 were 57,890 bushels of wheat, 297,744 of oats, 37,755 of barley, 157,946 of potatoes, 2,107,735 lbs. of butter, 361,300 of cheese, and 12,054 tons of hay. There were 2,671 horses, 18,655 milch cows, 10,443 other cattle, 2,067 sheep, and 6,606 swine; 11 brick kilns, 1 saw mill, and 1 paper mill. Capital, San Rafael.

**MARIŅA, Malinču, or Malinče, an Indian woman who rendered efficient aid in the conquest of Mexico. She was a native of the province of Guazacaleos, and of noble blood, though sold as a slave in her childhood to the Maya Indians of the frontier of Yucatan. Being thus familiar with the two principal languages of Mexico, she was presented to Cortes in Tabasco by a native chief, and, quickly acquiring Spanish, made herself indispensable to the conquerors as an interpreter. She was much beloved by the Mexicans, and exerted a great influence in restraining the barbarities against her countrymen which were but too common. Cortes made her his mistress, and by him she had a son, Don Martin Cortes, who figured in the political history of the colony. After the marriage of Cortes, she became the wife of the comendador Juan de Jaramillo, and survived till after the year 1556, living chiefly at Jalpan on the isthmus of Tehuantepec, where a mound is still shown as her burial place.**

**MARINER'S COMPASS.** See Compass.

**MARIN, or Marino, Giambattista, an Italian poet, born in Naples, Oct. 18, 1564, died there, March 23, 1625. He was driven from his home on account of his repugnance to the legal profession, and devoted himself to poetry under the influence of Tasso. The grand admiral, Prince Conca, made him his secretary, but a love affair drove him from Naples. In Rome he found a patron in Cardinal Pietro Aldobrandini, whom he accompanied to the court of Duke Charles Emanuel at Turin. His panegyric on the latter won for him the post of ducal secretary; but he wrote a satire against Murtola, a fellow secretary, who wrote a counter satire and attempted to shoot him; and on being released from prison at Marina's intercession, he ruined the latter by pointing out disparaging allusions to the duke in one of his poems. Marina was imprisoned, and recovered his liberty only through the intervention of Cardinal Gonzaga. He next went to Paris, to the court of Margaret of Valois, widow of Henry IV., and, after her death he became a favorite and pensioner of Maria de' Medici. He returned to Italy in 1622, and was received with great enthusiasm at Rome, and elected prince of the academy of the Umoristi. His *Adone* (Paris, 1623; new and complete ed., 4 vols., London, 1789) was regarded as a masterpiece at the time of its publication, though full of mannerism and defects, and so licentious that its circulation was not permitted. Among his other works are *La strage degli innocenti* (Rome, 1639), and several exquisite sonnets. There was for a time a large class of imitators of his style, called Marinists.

**MARIO, Giuseppe, marquis di Candia, an Italian singer, born in Cagliari, Sardinia, Oct. 18, 1810. He received an excellent musical education, and in 1830 entered the Sardinian military service. Having been ordered to Cagliari for certain youthful indiscretions, he resigned his commission; but upon the refusal of government to accept his resignation, he escaped to Paris, and by his admirable tenor voice soon attracted attention in the musical salons of that city. For the sake of satisfying his creditors, he accepted an engagement at the French opera at a liberal salary, assumed the name of Mario, and, after two years' study at the conservatory, made his début in December, 1838, in *Robert le diable*, with decided success. In the succeeding year he sang with Rubini at the Italian theatre, and formed one of that brilliant galaxy of singers then upon the stage,
comprising Rubini, Lablache, Tamburini, Malibran, Sontag, Persiani, and Grisi. From that period, he was constantly before the public, occupying the position of the first tenor singer upon the stage. After performing principally in London and Paris, he visited Russia in 1845, remaining there five years, and in 1850–60 generally sang in London in the spring and summer and in Paris in the winter. In 1854–5 he accompanied Grisi, with whom he had lived for many years, having by her a family of children, and whom he finally married, on an operatic tour through the chief cities of the United States. In 1859 he appeared in London and Paris in the part of Don Giovanni, in the opera of that name, transposed to suit his voice. On June 18, 1871, he took his farewell of the stage at Covent Garden in La favorita. In the autumn of 1872 he again visited the United States on a concert tour. His voice had quite failed him, however, and his reappearance was a detriment to his reputation. He possessed respectable dramatic abilities, and excelled in parts like Almaviva in the “Barber of Seville.” Among the operas in which he has principally appeared are La donna del lago, La gazza ladra, Cenerentola, Moïse, and others by Rossini; La sonnambula, Norma, and I puritani, by Bellini; Lucia di Lammermoor, La favorita, Lucrezia Borgia, Don Pasquale, &c., by Donizetti; and Ernani, La traviata, and Il trovatore, by Verdi.

MARION, the name of 17 counties in the United States.

I. A N. county of West Virginia, drained by the Monongahela and its branches; area, 279 sq. m.; pop. in 1870, 12,107, of whom 78 were colored. It is an undulating surface with considerable woodland, and a fertile soil. Coal and iron ore abound. The Baltimore and Ohio railroad intersects it. The chief productions in 1870 were 26,538 bushels of wheat, 63,643 of Indian corn, 29,819 of oats, 12,780 lbs. of wool, 22,927 of butter, and 3,759 tons of hay. There were 907 horses, 1,110 milk cows, 2,377 other cattle, 4,924 sheep, and 505 swine. Capital, Fairmont. II. An E. county of South Carolina, bordering on North Carolina, bounded E. by Little Pee Dee and Lumber rivers, and S. by the Great Pee Dee and Lynchescreek; the Little and Great Pee Dee also intersect it; area, 1,200 sq. m.; pop. in 1870, 22,160, of whom 10,732 were colored. The Wilmington, Columbia, and Augusta railroad traverses it. The surface is level and the soil moderately fertile. The chief productions in 1870 were 190,326 bushels of Indian corn, 11,412 of oats, 98,105 of sweet potatoes, 12,450 of peas and beans, 9,610 bushels of cotton, and 415,382 lbs. of rice. There were 1,419 horses, 975 miles and asses, 3,638 milch cows, 5,168 other cattle, 4,420 sheep and 19,521 swine. Capital, Marion Court House. III. A W. county of Georgia, drained by tributaries of the Chattahoochee and Flint rivers; area, 452 sq. m.; pop. in 1870, 8,000, of whom 3,830 were colored. The surface is undulating and the soil generally fertile. A branch of the Southwestern railroad passes through the N. W. corner. The chief productions in 1870 were 9,523 bushels of wheat, 163,298 of Indian corn, 20,967 of sweet potatoes, 18,050 lbs. of butter, 5,439 bales of cotton, and 5,380 gallons of molasses. There were 514 horses, 1,002 milk cows, 1,494 milch cows, 2,480 other cattle, 1,260 sheep, and 7,448 swine. Capital, Buena Vista. IV. A central county of the peninsula of Florida, intersected by the Ocklawaha river, and partly bounded S. by the Withlacoochee; area, 1,760 sq. m.; pop. in 1870, 10,804, of whom 7,878 were colored. The surface is level and the soil fertile. There are numerous lakes, of which the largest are Orange, Bryant, and Ware. The chief productions in 1870 were 129,506 bushels of Indian corn, 3,355 of oats, 23,865 of sweet potatoes, and 3,656 bales of cotton. There were 697 horses, 906 miles and asses, 8,985 milch cows, 396 working oxen, 458 other cattle, 442 sheep, and 3,488 swine. Capital, Ocala. V. A N. W. county of Alabama, bordering on Mississippi, drained by branches of the Tennessee and Tombigbee rivers; area, about 700 sq. m.; pop. in 1870, 6,059, of whom 224 were colored. The surface is uneven and the soil generally fertile. The chief productions in 1870 were 5,108 bales of wheat, 90,429 of Indian corn, 15,546 of sweet potatoes, 1,010 lbs. of tobacco, 9,691 of wool, 25,355 of butter, and 456 bales of cotton. There were 602 horses, 1,260 milk cows, 665 working oxen, 1,707 other cattle, 2,909 sheep, and 5,765 swine. Capital, Pikeville. VI. A S. county of Mississippi, bordering on Louisiana, and drained by Pearl river; area, 1,224 sq. m.; pop. in 1870, 4,211, of whom 1,649 were colored. It has an undulating surface and a fertile soil on the borders of the streams. The chief productions in 1870 were 69,691 bushels of Indian corn, 22,258 of sweet potatoes, 4,949 gallons of molasses, 798 bales of cotton, and 32,038 lbs. of rice. There were 797 horses, 2,206 milk cows, 4,637 other cattle, 4,627 sheep, and 8,574 swine. Capital, Columbia. VII. A N. E. county of Texas, bordering on Louisiana, and bounded S. by Big Cypress bayou and several lakes, which with Red river afford navigation to New Orleans; area, 320 sq. m.; pop. in 1870, 8,562, of whom 4,362 were colored. The bottom lands are very fertile. It has an abundance of timber of all kinds, and iron ore of superior quality; and there are seven mineral springs. The chief productions in 1870 were 73,118 bushels of Indian corn, and 8,345 of sweet potatoes. There were 362 horses, 943 milk cows, 2,503 other cattle, and 3,241 swine. Capital, Jefferson. VIII. A N. county of Arkansas, bordering on Mississippi River, and drained by the White river and its branches; area, 900 sq. m.; pop. in 1870, 3,979, of whom 19 were colored. It contains lead ore, and a variegated marble is found in the W. part. The chief productions in 1870 were 12,822 bushels of wheat, 115,169
of Indian corn, 302 bales of cotton, 19,361 lbs. of tobacco, 39,024 of butter, and 4,729 gallons of sorghum molasses. There were 845 horses, 849 milch cows, 1,763 other cattle, 2,288 sheep, and 7,952 swine. Capital, Yellville. X. A S. county of Tennessee, bordering on Alabama, partly bounded S. E. by the Tennessee, and intersected by the Little Sequachee river; area, 600 sq. m.; pop. in 1870, 5,841, of whom 915 were colored. The surface is hilly and broken, being traversed by ridges of the Cumberland mountains. The Jasper branch of the Chattanooga railroad terminates at the county seat. The chief productions in 1870 were 28,154 bushels of wheat, 265,100 of Indian corn, 27,989 of oats, 7,504 of Irish and 10,662 of sweet potatoes, 17,487 lbs. of tobacco, 9,157 of wool, 64,742 of butter, and 724 bales of cotton. There were 1,571 horses, 1,977 milch cows, 4,289 other cattle, 5,605 sheep, and 17,020 swine. Capital, Jasper. X. A central county of Kentucky, drained by the Rolling fork of Salt river; area, 304 sq. m.; pop. in 1870, 12,888, of whom 3,343 were colored. The surface is hilly and the soil generally fertile. The Knoxville branch of the Louisville, Nashville, and Great Southern railroad passes through it. The chief productions in 1870 were 33,580 bushels of wheat, 396,170 of Indian corn, 72,812 of oats, 16,676 of potatoes, 132,398 lbs. of tobacco, 22,102 of wool, 193,397 of butter, and 3,274 tons of hay. There were 8,398 horses, 1,385 mules and asses, 2,070 milch cows, 4,042 other cattle, 7,578 sheep, and 22,450 swine; 3 manufactories of agricultural implements, 5 of carriages and wagons, 4 of saddlery and harness, 1 woollen factory, 5 distilleries, 2 tanneries, 2 flour mills, 5 saw mills, and 2 planing mills. Capital, Lebanon. XI. A central county of Ohio, drained by the Scioto, Little Scioto, and Whetstone or Olenauty rivers; area, 384 sq. m.; pop. in 1870, 16,184. It has a level surface and fertile soil. It is intersected by the Atlantic and Great Western and the Cleveland, Columbus, Cincinnati, and Indianapolis railroads. The chief productions in 1870 were 285,019 bushels of wheat, 635,281 of Indian corn, 106,639 of oats, 53,780 of potatoes, 702,090 lbs. of flax, 337,617 of wool, 439,226 of butter, and 29,062 tons of hay. There were 6,715 horses, 4,897 milk cows, 9,160 other cattle, 89,616 sheep, and 16,800 swine; 2 manufactories of agricultural implements, 15 of carriages and wagons, 1 of machinery, 3 of furniture, 4 tanning and currying establishments, 15 saw mills, and 3 flour mills. Capital, Marion. XII. A central county of Indiana, drained by the West fork of White river; area, 390 sq. m.; pop. in 1870, 71,939. It has a nearly level surface and fertile soil. A number of railroads concentrate at the county seat. The chief productions in 1870 were 613,267 bushels of wheat, 1,305,988 of Indian corn, 78,546 of oats, 220,885 of potatoes, 37,459 lbs. of wool, 378,963 of butter, and 17,464 tons of hay. There were 7,483 horses, 6,424 milch cows, 7,705 other cattle, 13,173 sheep, and 27,989 swine. The total number of manufacturing establishments was 740, having a capital of $8,308,185 and an annual product of $16,642,105. The principal products were leather, boots and shoes, bricks, carriages, cars, clothing, cooperage, cotton and woollen goods, furniture, iron and hardware, machinery, paper, saddlery and harness, tobacco and cigars, varnish, planed lumber, flour, and pork. Capital, Indianapolis, which is also the capital of the state. XIII. A S. central county of Illinois, drained by Skillett fork of Little Wabash river; area, 579 sq. m.; pop. in 1870, 29,062. It has an undulating surface and fertile soil. The Illinois Central and the Ohio and Mississippi railroads intersect it. The chief productions in 1870 were 173,652 bushels of wheat, 1,034,057 of Indian corn, 389,446 of oats, 37,669 of potatoes, 40,285 lbs. of wool, 81,014 of butter, and 21,242 tons of hay. There were 6,695 horses, 4,457 milch cows, 7,027 other cattle, 14,511 sheep, and 21,883 swine; 18 manufactories of carriages, 10 of saddlery and harness, 6 of tin, copper, and sheet-iron ware, 3 of machinery, 9 saw mills, and 11 flour mills. Capital, Salem. XIV. A S. central county of Iowa, intersected by the Des Moines river; area, 576 sq. m.; pop. in 1870, 24,436. The surface is undulating, with much prairie, and the soil fertile. The Des Moines Valley railroad passes through it. The chief productions in 1870 were 374,414 bushels of wheat, 2,110,906 of Indian corn, 189,381 of oats, 152,763 of potatoes, 88,820 lbs. of wool, 499,158 of butter, and 21,522 tons of hay. There were 8,975 horses, 7,162 milch cows, 13,322 other cattle, 29,074 sheep, and 41,288 swine; 5 manufactories of carriages and wagons, 2 of woollen goods, 2 flour mills, and 6 saw mills. Capital, Knoxville. XV. A N. E. county of Missouri, separated by the Mississippi from Illinois, and drained by North and South Fabius and North Two and South Two rivers; area, 425 sq. m.; pop. in 1870, 26,780, of whom 2,502 were colored. It has an undulating surface, mostly prairie, and a very fertile soil. It is traversed by the Hannibal and St. Joseph, the Quincy, Missouri, and Pacific, and the Toledo, Wabash, and Western railroads. The chief productions in 1870 were 230,822 bushels of wheat, 305,256 of Indian corn, 158,715 of oats, 25,936 of potatoes, 53,488 lbs. of tobacco, 41,481 of wool, 22,700 of butter, and 10,212 tons of hay. There were 6,340 horses, 1,145 mules and asses, 4,366 milk cows, 9,130 other cattle, 14,970 sheep, and 20,019 swine; 1 manufactuary of railroad cars, 2 of machinery, 2 of tobacco, 1 of woollen goods, 2 iron founderies, 4 breweries, 11 saw mills, and 4 flour mills. Capital, Palmyra. XVI. An E. central county of Kansas, watered by Cottonwood river; area, 1,044 sq. m.; pop. in 1870, 768. It is traversed by the Atchison, Topeka, and Sante Fe railroad. The surface is undulating and the soil fertile. The chief productions in 1870 were
of which William Moultrie was colonel. Marion’s company was one of those despatched from Charleston for the capture of the British fort Johnson. The place was taken, and the guns were directed upon the men-of-war in the harbor. The British shipping was completely expelled from the harbor by the cannon from another fort established by Moultrie on Haddrell’s point. A British officer at Dorchester was accused to Marion, who was promoted in his regiment. He was soon summoned thence to the defence of the fort begun on Sullivan’s island, menaced by a powerful British fleet. It was assailed before it was finished, but the hostile fleet was repelled with great loss. In February, 1777, Marion was despatched with 600 men to the defence of Georgia, where he served at intervals until the British with overwhelming forces had gained possession of the state. Fort Moultrie (Sullivan) was again confided to his charge, and he held this post during Gen. Prevost’s attempt at a capture. Marion on Charleston (1779). He subsequently joined the united French and American forces in the fruitless attack on Savannah. During the siege of Charleston he accidentally broke his leg, and was therefore conveyed with all other invalids out of the city. As he grew able for service, the Carolinians being left almost defenceless, he gathered his neighbors about him and laid the foundation of that brigade which finally became famous for its partisan successes. Meanwhile Gen. Gates had been despatched by congress to take command of the southern army. At the approach of the continental forces, Marion, then a colonel, joined them in North Carolina; but so wretched were his equipments, and so paltry his numbers, that Gates remarked only the ridicule which they provoked in the camp, and failed to appreciate their patriotism and ability. He despatched Marion on an idle mission to cut up the boats on the rivers to prevent the escape of the British. A few days later Gates was defeated in the battle of Camden (Aug. 16, 1780), while Marion, waylaying the British guards, dispersed them and rescued their continental prisoners. From this period dates the series of adventurous flights, forages, marches, countermarches, and surprises which distinguished the brigade of Marion until the establishment of peace. He kept alive the spirit of patriotism, taught the inexperienced frontiersman to be both bold and vigilant, how to discipline himself, and how to arm and support himself, at a time when the country had no resources for him. In 1780 Marion was promoted to a brigadiership, and his command was termed a brigade whether it numbered 20 or 1,200 men. It is impossible to pursue in detail the progress of such restless and eager a chieftain in a career marked by a variety of action and resource. Even popular tradition fails to follow him. His camp at Snow’s island, his potato feast to the British
officer, his quiet humor when dealing with both friend and foe, his perpetual vigilance and sudden movements, have all entered into the legends of the country. Though South Carolina was an island, a natural fortress of swamps and forests accessible only under good guidance, was his favorite hiding place, yet he had other retreats in almost every swamp of Carolina, where he found ready refuge from a superior enemy, and whence he could rapidly emerge. His food was chiefly potatoes and corn; his only drink was vinegar and water; for months he slept without a blanket, and marched without a hat; and he trained his followers to his own habit of cheerful endurance. He disciplined in his style of warfare many young officers, who proved in time worthy of their master. In December, 1780, Gen. Greene, superseding Gates, took command of the southern army. He was able to appreciate the courage and services of Marion, who now united his brigade with the main army, and acted separately, as the occasion or the wishes of the continental government required. He was Greene's great resource for obtaining intelligence; had his spies in the British camps and garrisons; in Camden, Charleston, Georgetown, and Savannah; and was himself almost ubiquitous with his brigade. He baffled Tarleton, Barfield, Doyley, Gainey, McArthur, Coffin, and Wemyss, all of whom were in turn or in concert despatched for his express capture or defeat. After Cornwallis had driven Greene's army out of the state Marion held his ground, pressed his predatory warfare to the gates of Charleston, and interrupted the line of communication between the metropolis and all parts of the interior. Col. Watson with a picked force was sent to expel or crush him. Major Gainey, of whom great expectations were formed, was also sent in pursuit; yet he was defeated by Marion, narrowly escaping with his life. Col. Tyne, whom Marion had once before defeated, was also on his track, and was again foiled. Major McIlraith, sent with another division to cooperate with Watson, was in close pursuit of him, but he baffled them both, so palpably that McIlraith was disgraced. The next auxiliary of Watson was Col. Doyle, subsequently distinguished as a British general in India. Each took the field with a regiment of British, and a large additional force of loyalists. Unable openly to meet either division, Marion determined to prevent their junction. Watson was led into one ambush after another until, having lost a large part of his men, he reached Georgetown. Marion then turned upon Doyle, who made a precipitate retreat and avoided him. This retreat was in part occasioned by the necessities of Rawdon, who called in his detachments at the approach of Greene. Being joined by Lee's legion and supplied with ammunition, Marion determined to attack Fort Watson on the Santee river. It was on high ground, and as he was without artillery, towers made of logs were extemporized during the night, and raised sufficiently high to enable the riflemen to plant themselves on an elevation equal to that of the works; and while the sharpshooters plied their bullets, a stormy party scaled the walls, and the garrison surrendered. Lee then rejoined Greene, but after the battle of Hobkirk's Hill aided Marion in investing Fort Motte on the Congaree. The besiegers again felt the want of artillery, but Mrs. Motte, the original owner of the house around which the fort had been constructed, furnished an Indian bow with arrows, which, tipped with combustibles, set fire to the roof over the heads of the garrison, which then capitulated. Marion distinguished himself by prudence and humanity superior to his times, and prevented Lee's men from hanging some of the prisoners. Some causes of complaint tempted him soon after to resign his commission and join the main army under Washington; but Greene succeeded in dissuading and retaining him, and he was soon repeating his exploits on the skirts of Lord Rawdon's forces, and while holding him in check captured Georgetown. He subsequently joined Greene and Sumter in the pursuit of Rawdon, till he intrenched himself in Orangeburg, and declined battle. After the evacuation of Orangeburg and the departure of Rawdon for Europe, the forces of Marion and Sumter swept the country to the gates of Charleston. He, then resumed his independent command in the Santee country, took an important part in the battle of Eutaw Springs (Sept. 8, 1781), and pursued the enemy in their retreat. The British were gradually confined almost to the walls of Charleston, and the legislature of the state again assembled for the purpose of restoring civil authority. Marion steadily refused to engage in any unnecessary enterprise after the prospect of peace. He disbanded his brigade soon after the British fleet and army evacuated Charleston (Dec. 14, 1782), taking a tender farewell of his followers, and returned to the avocations of a farmer almost in poverty. He was subsequently returned to the senate of the state by the electors of St. John's parish, Berkeley. In 1784 he accepted the appointment under the state of commandant of Fort Johnson, and soon after married. In 1790 he was a member of the convention for framing a state constitution, and in 1794 he resigned his commission as one of the generals of the state militia. He was buried at Belle Isle, in the parish of St. John's, and a slight oblong tomb, the tribute of a private citizen, covers the remains of one of the purest men, truest patriots, and most adroit generals that American history can boast.

MARIOTTE, Édme, a French physicist, died May 12, 1864. The date and place of his birth are unknown. He was prior of St. Martin-sur-Beaune, Dijon, and one of the original members of the French academy of sciences. Condorcet says that "Mariotte was the first one in France who introduced into physics a
MARIPOSA

spirit of observation and doubt, and who in-
spired that scrupulousness and caution so ne-
necessary to those who interrogate nature and in-
terpret her responses. His collected works
were published at Leyden in 1717, and at the
Hague in 1740, in 2 vols. 4to. They contain
papers upon a great variety of subjects in phys-
ics and natural philosophy, and are filled with
accounts of his numerous and ingenious ex-
periments. His principal discoveries were: 1.
the law in regard to gases, usually called Mar-
otte's law, that, the temperature of a gas re-
mainning fixed, its volume varies inversely as
the pressure upon it (see PNEUMATICS); 2.
that air exists in liquids, especially in water; 3.
that the part of the retort where the optic nerve
enters it is insensible to light. He also in-
vented the now common experiment of drop-
ing a coin and feather in the exhausted re-
cipient of an air pump, to show that both will
fall through equal distances in equal times.

MARIPOSA, an E. county of California, drained
by the Merced and Mariposa rivers, affluents
of the San Joaquin; area, 1,440 sq.
m.; pop. in 1870, 4,572, of whom 1,084 were
Chinese. The surface is mountainous, the E.
part being traversed by the Sierra Nevada;
the soil in the W. is of great fertility. Gold
abounds throughout the county, being found
in nearly every creek and gulch and in quartz
veins. Three placers and three quartz mines
were in operation in 1870. It contains the
Yosemite falls and the Mammoth Tree grove.
(See CALIFORNIA.) The chief productions in
1870 were 4,275 bushels of wheat, 8,155 of
barley, 1,712 of potatoes, 87,816 lbs. of wool,
and 2,499 tons of hay. There were 1,110
horses, 923 milk cows, 6,118 other cattle,
18,443 sheep, and 8,577 swine; 1 iron foun-
dery, 2 breweries, 4 saw mills, and 2 quartz
mills. Capital, Mariposa.

MARIPEA (anc. Aepora), a large river of Rou-
mania, emptying into the sea at the E. end of
the Black Sea. Its course is divided. The
tributary, which rises on the N. E. side of
the Dniester, is navigable for 120 miles; the
other, which rises on the N. W. side of the
Don, is navigable for 200 miles.

MARIUS, a Roman soldier, born near
Arpinum in 157 B. C., died in Rome in 86. His
origin was humble, and his parents are said to
have been clients of the Herennii, an eminent
plebian family. That he ever labored for
wages may be doubted, and may have been
one of the reports invented to injure him by the
optimates, and accepted by him to make his
elevation seem the greater by contrast with his
original position. Marius had no third name,
or cognomen, nor did he ever win one, not-
withstanding his brilliant military services.
A passage in Vellius Paterculus, which re-
 presents him to be of equestrian birth, is believed
to be an error of some transcriber. Plutarch
expressly states that his parents were obscure,
and that they gained their living by the labor
of their hands. The first mention of him in
history is as a soldier in the army with which
the second Scipio Africanus besieged Numantia
in 134, when he was but 22 years old. His bra-
vory, his sobriety, and the readiness with which
he submitted to the severe reforms that Scipio
found it necessary to introduce into the Ro-
man army, attracted the attention and won the
commendation of that great general. The
tradition was, that Marius was so encouraged
by Scipio's words, deeming them to form a di-
vine intimation, that he entered on a political
career; yet it was not until 15 years later that
he achieved his first political success, being
then chosen tribune of the people (119). This
office he obtained through the influence of
Metellus, who belonged to the Caelian gens,
one of the most distinguished plebian houses
in Rome. He had previously been unanimous-
lly elected military tribune. As tribune of the
people he introduced a bill calculated to pro-
mote the freedom of elections, which was op-
posed by the optimates, then at the height of
their power, immediately after the fall of Caius
Gracchus; but Marius, by the most vigorous
measures, carried his point, though the oppo-
sition was headed by his patron, the consul
Metellus. He showed his firmness in another
way, by opposing a distribution of corn among
the people, because he believed it injurious to
their interests. He sought to introduce an
adels-
ship, but was forced to withdraw from the con-
test; and he was beaten as a candidate for
the plebian adelship. Elected praetor, his
name was the lowest on the list. He was then
proceeded against for bribery, but escaped con-
 viction, the votes of his judges being equal-
ly divided. He was praetor in 115, but did not
leave Italy. As praetorius, the next year, he
served in Further Spain, which he is report-
ed to have cleared of robbers. Shortly after-
ward he married Julia, a sister of the father of
Julius Caesar, who belonged to one of the most
illustrious families (patrician gens) of Rome.
Q. Cæcilius Metellus took command of the Roman
army employed against Jugurtha (109), Marius
became one of his legates, and distinguished
himself in the war, being very popular with
the common soldiers, and attracted the atten-
tion of his countrymen at home. He asked
leave of Metellus to go to Rome, that he might
offer himself as a candidate for the consulship;
but his commander, after first seeking to argue
against his supposed unreasonable ambition,
and then declaring that he could not be spared
from the army, finally refused his request in
an insulting manner. Marius then commenced
intriguing against Metellus, whom he accused
of prolonging the war, which he offered to
bring to a prompt conclusion with one half the
force then employed against Jugurtha. These
things were all known at Rome, where they
increased the popularity of Marius. To get rid
of an enemy, Metellus granted him the permis-
sion he had asked, but only 12 days before the
time of election. Arriving at Rome, Marius en-
MARIUS

tered on the contest at once, and became con-
sul in 107, at the age of 50. He did not bear
his success with meekness, but made use of the
harshest language when speaking of the aristoc-
racy. The province of Numidia was assigned
him, which made him the successor of Metel-
lus. In levying soldiers he did not confine
himself to the classes whence the legions had
formerly been recruited, but enrolled men from
the lowest orders, and slaves, which is regard-
ed as the first of those acts through which the
Roman armies were led finally to look for law
more to their commanders than to the state.
He led his new levies to Africa, where he vigor-
ously waged the war against Jugurtha until the
latter took refuge with Bocchus, king of Mau-
ritania, who betrayed him to Sulla, the questor
of Marius (106). This caused Sulla to claim
the merit of having closed the war, and so laid
the foundation of a personal quaran destined
to have memorable consequences. Marius re-
mained two years longer in Numidia, bringing
the country into order and establishing the
Roman government there. While thus en-
gaged, he was elected consul without opposi-
tion, the approach of the Teutons and Cimbri
and the Ambrones, who had destroyed several
Roman armies, having caused great fear in
Italy, and drawn all men's minds to the con-
clusion that power could be intrusted to no
one but the conqueror of Numidia. His Ju-
gurthine triumph took place Jan. 1, 104, the
first day of his second consulship. Jugurtha
walked in the procession, and afterward was
thrown into a dungeon and starved to death.
The barbarians not appearing in Italy, Marius
employed the time in effecting reforms in the
army, and in disciplining the newly raised
troops. His discipline was severe, but the im-
partiality of his conduct made him a favorite
with the men, who had the utmost confidence
in his ability and good fortune. He was cho-
en consul a third time for the year 103. The
enemy still remaining in Spain, the aristocratic-
ally determined to oppose his reélection;
but the people supported him, and he was el-
vated a fourth time. This year he encountered
the Teutons and Ambrones in Gaul, totally
destroying them in a great battle fought near
Aquae Sextiae, the modern Aix. Just after the
battle Marius received news that he had been
elected consul for the fifth time. Meantime
the Cimbri, who had separated from their al-
lies, had penetrated into Italy, where the ter-
or of their name caused the army of Catulus,
the other consul, to fly before them. Marius
was recalled to Rome. Refusing the triumph
offered him by the senate until the Cimbri
should be conquered, he joined the army of
Catulus, with which the troops who had con-
quered the Teutons were now united. On
July 30, 101, the Cimbri were ambuscaded in
a pitched battle, fought on a plain called the
Campi Raulii, near Verceille, the modern Ver-
cellii. The victory was really due to Marius,
though his enemies sought to give the credit
of it to Catulus, who was then proconsul; but
the Romans were so convinced that they owed
their deliverance to the consul, that among
other high honors they gave him the title of
third founder of the state, thus ranking him
with Romulus and Camillus. His triumph was
brilliant, and Catulus was allowed to share in
it. For the sixth time he was chosen consul;
but the good fortune which he had experienced
in the field deserted him in the city, where his
ignorance of civil life led him into various mis-
takes, which caused his popularity to decline as
rapidly as it had risen. The aristocracy art-
fully placed him in opposition to the tribune
Saturninus, who was his instrument and asso-
ciate, and whom he had to proceed against to
the tribune's ruin and death. He entrapped
his old enemy Metellus into a position that
caused him to be banished. So low had Marius
 sunk by the time his sixth consulship was draw-
ing to a close, that he durst not become a can-
didate for the censorship. The next year (99)
he visited Asia, where he sought to rouse Mith-
ridates to make war on Rome, being confident
that he should recover his popularity when
once more placed at the head of an army. He
was chosen war in his absence. After
his return to Rome, he did not rise in popular
esteem; he could obtain no command in the
East, and Sulla, who had supplanted him in
the popular favor, exasperated him by his con-
duct. The Mauritanian king had set up in
the capitol figures showing the surrender of Ju-
gurtha to Sulla. Marius was making prepara-
tions to pull down these figures, and Sulla to
resist him, when, in 90, the social or Marsic
war broke out, which threatened the subversion
of the Roman power in Italy. Both Marius
and Sulla had to contend against the confed-
erate Italians in the social war, and both did so
with success. It was thought, however, that
the exploits of Sulla were the more striking,
but it is certain that Marius twice defeated the
Marsi, the most warlike of all the allies, and
whose name furnished to the Romans a title
for the war. He returned to Rome after these
victories, avowedly because of his inability to
encounter the fatigues of the service. He was
67 years old, and had grown fat and unwieldy.
After this war had been finished, the rivalry
of Marius and Sulla was resumed. War against
Mithridates having been commenced, Marius
sought the command in the East. He fre-
cquented the Campus Martius, and went through
exercises appropriate to the young, in order to
show that he was equal to the fatigues of war.
He failed, and Sulla was appointed to the office
he sought (88). Marius now procured the
passage of a law to distribute the Italian allies,
who had been admitted to the Roman fran-
chise, among all the tribes, so that they should
control the old citizens. This tool was P.
Sulpicius Rufus a tribune, and he was suc-
cessful, though not without having resort to
violence. The Italians then conferred the
eastern command upon Marius; but Sulla, who
had joined the army destined to act against Mithridates, incited it to resistance, marched to Rome, and compelled Marins and his friends to fly; there having no force to send against him. Marins vainly endeavored to raise an army by offering freedom to all slaves who should join him. He then sought to reach Africa, but was compelled by bad weather and want of provisions to land in Italy, near which he was coasting. Taking refuge in a wood, and suffering from cold and hunger, he predicted that he should yet receive a seventh consulship. He told his companions that in his childhood a nest with seven eaglets in it had fallen into his lap, and that the soothsayers had prophesied to his parents that he should seven times enjoy supreme power. Flying from immediate pursuit, he and his company were forced to swim to two merchant vessels, the crews of which refused to give them up, but afterward made them land at the mouth of the Liris. Here, while concealed in a marsh, Marius was found by his pursuers, and imprisoned at Minturnae. A Cimbri soldier was ordered to despatch him, but was so affected by the old man's look and language that he lost courage, and declared that he could not kill Cains Marius. The people of the town rose in his favor, and furnished him with a vessel, in which he sailed to Africa, meeting with many dangers on the way. He landed at Carthage, where a message was sent him by the Roman praetor, ordering him to leave the country. His answer was: "Tell the pretor that you have seen Cains Marius a fugitive sitting on the ruins of Carthage," a reply, says Plutarch, in which he not inaptly compared the fate of that city and his own changed fortunes. He was soon compelled to leave, and went with his men to the island of Cercina. Meantime a revolution had taken place in Italy, where the consul Cinna, who was of the Marian party, had placed himself in opposition to the Sullan faction, headed by his colleague Octavius. The latter, after a severe struggle, expelled Cinna from Rome, who raised a large army, composed of the new citizens. Marins, on hearing of this, returned to Italy, and on landing proclaimed freedom to the slaves, and sent to Cinna, offering to obey him as consul. Cinna accepted the offer, and named him proconsul. This office Marins would not accept, saying its title and insignia were not suited to one in his state. One idea, that of vengeance, alone had possession of his mind. Rome was soon compelled to surrender to the army headed by Cinna and Marius. The former was disposed to proceed mildly, but Marius had other intentions. At first he refused to enter the city until the comitia repealed the law under which he had been banished; but while the voting for that purpose was going on, he entered at the head of his guards, who were composed of the slaves by whom he had been joined, and an immediate massacre of the anti-Marians was begun. The slaughter was continued for several days, and among its victims were many of the noblest of the Romans. Cinna and Marius declared themselves consuls for the next year, 86. But though Marius had thus irregularly obtained his seventh consulship, he did not long enjoy it, dying on its 18th day, from illness brought on by age, fatigue, and care. The statement that his mind was disordered by fear of Sulla's return is probably one of the libels of the Sullan party. After the triumph of Sulla, the ashes of Marius were thrown into the Anio, by order of the victor. The reason of this is either to prevent the finder, of the party which bears his name in the subsequent history of the Roman republic, and which he was clearly incompetent to conduct to success, his character has probably suffered, like that of other party chiefs, at the hands of his enemies. No Roman ever rendered greater services to the state, and no Roman ever rose so high, to fall so low, with the single exception of Pompey, who in the next generation headed the opposite party. MARIVAUX, Pierre Carlet de Chamblain de, a French author, born in Paris in 1688, died there, Feb. 19, 1763. He wrote about 30 comedies, the greater part for the Italian theatre, and now seldom performed. Among the best are Le jeu de l'amour et du hasard, the author's dramatic masterpiece, and Les fausses confidences. He is now known chiefly by his romances, La vie de Marianne et Le paysan parvenu. He also wrote Le spectateur françois and Le philosophe indigent, distinguished by an eccentric and affected style, called after him marivaudage. He was elected a member of the French academy in 1749, Voltaire being a rival candidate. MARJORAM, the common name of plants of the genus origanum, in the natural order labiatae, having nearly entire leaves and purplish or whitish flowers crowded in cylindrical or oblong spikes, which are imbricated with frequently colored bracts. About 25 species are enumerated, of which the most common in the gardens is the sweet marjoram (O. majorana), native of Barbary and middle Asia. It is a clean, pretty, low, bushy plant, usually treated as an annual, but properly a perennial. The fragrant leaves and buds, being carefully dried, are pulverized by rubbing them in the hands, and are employed by cooks as a seasoning for forcemeat, soups, soups, etc. On account of the compact clusters or heads, it is in some localities known as knotted marjoram. The wild marjoram (O. vulgare) has become sparingly naturalized in the United States, adventitiously introduced from Europe. It can be found occasionally upon dry banks and sunny slopes. Its flowers are very pretty, appearing in the months of July and August. Essential oils may be extracted from either of the species mentioned above, but the oil which is now known in commerce as oil of origanum has been shown to be really derived from the thymus
vulgaris, a mint growing in the south of France. This is sometimes used as an external irritant, especially in veterinary practice, and, like many other volatile oils, will allay toothache when introduced into a curious cavity. Internally it is a stimulant, but has no great value.

MARK, Saint, the evangelist, according to the opinion of most theologians, identical with John Mark, mentioned in the Acts (xii. 12, 25). By comparing the passages of the New Testament relating to both Mark and John Mark, we learn the following facts of his life. He was the son of a certain Mary, who pos-
sessed a house at Jerusalem which served the Christians as a place of refuge. About the time when James the Elders was executed, he left Jerusalem with Paul and Barnabas, his kinsman (A. D. 42), went to Antioch, and from there to Cyprus and Asia Minor, but sepa-
rated from them at Perge, in order to return to Jerusalem. Paul blamed this conduct; and when later Barnabas proposed to take Mark along on a new missionary tour, Paul objected, and Barnabas and Mark undertook a journey of their own. But we find him again as a friend and fellow laborer of Paul in the first captivity of the latter. It appears that both intended, after the end of the captivity, to visit the Christians of Asia Minor. Mark probably executed this design, for Paul re-
quests Timothy (2 Tim. iv. 11) to bring Mark to Rome. He was with the apostle Peter, near Babylon (which, according to many inter-
preters, designates Rome), when that apostle wrote his first epistle. According to the testimony of the ancient church, Mark was in a particularly intimate relation to the apostle Peter, who employed him as secretary in the same way as Titus was employed by Paul. After the death of Peter, Mark is said to have gone to Egypt, and especially to Alexandria, to have collected congregations there and in the neighborhood, to have been the first bishop of Alexandria, and, finally, to have suffered martyrdom there. He is the patron saint ofVen-
ice, which city claims to possess his body. His festival is celebrated in the Roman Catholic church on April 25.—The Gospel of Mark is distinguished from the three others by being more exclusively historical, and excluding longer didactic portions, such as the sermon on the mount. All the facts recorded in it may be found also in Matthew or Luke, and only 27 verses belong exclusively to Mark; a circumstance which has given rise to wide differ-
ce of opinion concerning the position of Mark in relation to the other two. Augustine advanced the opinion that Matthew wrote first, that Mark wrote an abridgment of the Gospel of Matthew, and that Luke in writing his Gos-
pel made use of both Matthew and Mark. This view continued to prevail among exegetical writers until the 18th century, when the ques-
tion of priority of composition among the three synoptic Gospels (Matthew, Mark, and Luke) became the subject of vehement controversy, every possible combination finding its defend-
ers. Eichhorn in 1794 advanced the theory that all the three synoptic Gospels of our can-
on had made use of a primitive Gospel (Ur-
Evangelium), no longer extant. Many Ger-
man critics assume a primitive Gospel of Mark (Ur-
Markus), of which the Gospel in our canon is a revised and enlarged copy. Among the prominent defenders of this view are Ewald (1849), Scholten (1857), Volkmar (1870), and Weiss (1872). Others have advanced similar views with regard to Matthew and Luke. Most of these writers agree in regarding the Gospel of Luke as the latest of the synoptic Gospels in their present form; the most notable exception being Keim, who (in his “Life of Jesus”) main-
tains that the Gospel of Mark is the latest of the three. The defenders of the originality of the Gospel of Mark in its present form gener-
ally place the time of its compilation between the death of the apostles Peter and Paul and the destruction of Jerusalem. Rome is almost unanimously regarded as the place where it was written. The evangelist undoubtedly used the Greek language; a note to the Syrian trans-
lation, stating that the Gospel was compiled in Latin, received for a time wide currency among Roman Catholic scholars through the support of Baronius, but it has been almost entirely discarded since the time of Richard Simon. Doubts are entertained also by prominent the-
ologians of the orthodox school whether the last 12 verses are by Mark, or were added after his death; in support of the latter view it is adduced that Jerome, Gregory of Nyssa, and other fathers expressly mention that the Gos-
pel closed with the words, “For they were afraid” (xvi. 8); in favor of the other, that all the Latin and Syrian manuscripts have these verses.—For commentaries on Mark, see the collective works on the Gospels mentioned in the article Luke. Commentaries on Mark
alone have been published, among others, by J. A. Alexander (New York, 1858), Klostermann, Das Markuskvangelium (Gottingen, 1868), and Weiss, Das Markuskvangelium und seine synoptischen Parallelen (Berlin, 1872). Accounts of the modern discussions about the origin and history of the Gospel of Mark may be found in Wilke, Der Ureueangelist (Leipsic, 1838), F. C. Baur, Das Markuskvangelium (Tubingen, 1851), and in the commentaries of Klostermann and Weiss. A full account of the literature on the subject is given by Sevin in "Erklerung der drei ersten Evangelien" (Wiesbaden, 1876).

MARK ANTONY. See Antony.

MARKHAM, Clements Robert, an English geographer, born at Stillington, near York, July 20, 1830. He was educated at Westminster school, and entered the navy in 1844. In 1846 he was appointed naval cadet on board a vessel on the Pacific station, and, having passed for a lieutenant, left the navy in 1851. In 1850–51 he served in the expedition in search of Sir John Franklin, and in 1852–4 explored the forests of the eastern Andes. In 1855 he became clerk in the board of control, and in 1858 secretary of the Hakluyt society. Between 1859 and 1866 he again went to Peru and twice visited India, where he introduced the cultivation of the cinchona tree. In 1863 he was made secretary of the royal geographical society, and in 1867 assistant secretary in the India office, receiving charge of its geographical department in 1868. In the latter year he was appointed geographer to the Abyssinian expedition, and was present at the storming of Magdala. Besides many translations for the Hakluyt society and papers in the journal of the royal geographical society, he has published "Franklin's Footsteps" (1852); "Cuzco and Lima" (1856); "Travels in Peru and India" (1862); "Quichuan Grammar and Dictionairy" (1863); "Spanish Irrigation" (1867); "History of the Abyssinian Expedition" (1869); "Life of the Great Lord Fairfax" (1870); Ollanta, a Quichuan Drama" (1871); "Memor on the Indian Surveys" (1871); a translation, printed by the Hakluyt society, of the "Reports on the Conquest of Peru" (1872); "The Threshold of the Unknown Regions" (1873); and a "General Sketch of the History of Persia" (1874). He is the editor of the "Geographical Magazine."

MARKIRCH, or Mariakirch (Fr. Ste. Marie-aux-Mines), a town of Alsace-Lorraine, Germany, 22 m. N. W. of Colmar; pop. in 1871, 12,319. It is one of the most flourishing centres of Alsatian industry. Among the principal branches of manufacture are silk, wool, and cotton weaving, dyeing, and bleaching. The valley of Markirch is one of the most picturesque of Alsace. There are lead and copper mines in the neighboring mountains. The town is of recent origin.

MARL, a clay containing a large proportion of carbonate of lime, sometimes 40 to 50 per cent. If the marl consists largely of shells or fragments of shells, it is called shell marl. In New Jersey the layers of greensand are very generally known as marl beds, a name more correctly applied to the tertiary beds made up of marine fossil shells which are found near the coast of the middle and southern states, and are employed for fertilizing the soil. In the northern states rich marl deposits are often found at the bottom of ponds, in the form of a thin white mud filled with minute fresh-water shells of living species. (See Greensand.)

MARLBOROUGH, a N. E. county of South Carolina, bordering on North Carolina, bounded W. by the Great Pee Dee river, and watered by its affluent streams; area, 505 sq. m.; pop. in 1870, 11,814, of whom 6,668 were colored. The surface is level and the soil productive. The chief productions in 1870 were 6,321 bushels of wheat, 158,088 of Indian corn, 20,748 of oats, 17,694 of peas and beans, 42,356 of sweet potatoes, 17,677 lbs. of rice, and 8,643 bales of cotton. There were 916 horses, 919 mules and asses, 1,637 milch cows, 2,907 other cattle, 974 sheep, and 8,970 swine. Capital, Bennettsville.

MARLBOROUGH, a town of Middlesex Co., Massachusetts, on a branch of the Fitchburg railroad, and on the Boston, Clinton, and Fitchburg railroad, 25 m. W. of Boston, and 15 m. E. N. E. of Worcester; pop. in 1870, 8,474. It is built on numerous hills, and contains within its limits Lake Williams, a beautiful sheet of water covering 160 acres. It has a handsome soldiers' monument of granite, a brick town hall costing $87,000, three hotels, gas works, and a good fire department. There are 25 boot and shoe manufactories, of which several are very extensive; a national bank, 36 public schools, four evening schools, five private schools, a public library of 5,000 volumes, two weekly newspapers, and seven churches. Marlborough was incorporated in 1661.
MARLBOROUGH

John Churchill, duke of, a British general, was born at Ash, in Devonshire, June 24, 1650, died in London, June 16, 1722. He was the son of Sir Winston Churchill, a royalist of some note, who procured for him the place of page to the duke of York, shortly after the restoration. His education was slight, but he was a favorite with the duke, who made him an ensign in the guards at the age of 16. He served at Tangiers against the Moors, and in the auxiliary force which Charles II. sent to aid the French in their attack on Holland, where he won the praise of Turenne by his courage and capacity. Louis XIV. made him a colonel, and on his return to England after the peace of Nimeguen the duke of York gave him high appointments in his household. He owed his advancement as much to the influence of his sister Arabella as to his own merits, she being the mistress of the duke of York. He was engaged in not a few intrigues of gallantry, and is said to have jumped from the window of the chamber of the duchess of Cleveland, one of the most notorious of the king's mistresses, to avoid the king. The lady rewarded him by the present of £25,000, with which he purchased aannuity of £2600 a year. In 1678 he married Sarah Jennings, a young woman of good family, in the service of the duchess of York, who became famous for her talents and imperious temper. He received military promotion, and was made Lord Churchill in the peerage of Scotland; and soon after, on the marriage of the princess Anne with Prince George of Denmark (1683), Lady Churchill was made chief lady of her bedchamber. The ladies had been friends for some time, though no two persons could be more unlike; Anne being as dull, heavy, and yielding as Sarah was lively, changeable, and imperious. They corresponded, when unavoidably separated, under the names of Mrs. Morley and Mrs. Freeman. The influence thus established lasted for more than a quarter of a century, and would have ended only with Anne's life if Lady Churchill had known how to govern her temper. On the duke of York becoming James II., Churchill was made general and baron of Sandridge, and was sent as ambassador to France. On the rebellion of the duke of Monmouth, he performed important military services, and the victory of Sedgemoor was due to him. He was not conspicuous during the reign of James II., and was opposed to the policy of that prince; but his opposition was not of a demonstrative character, and down to the last moment he enjoyed the king's confidence. The influence of his wife over Anne was used with effect to keep the princess opposed to her father's policy, and in 1687 Churchill communicated that fact to William of Orange. On the landing of William, Churchill was made a lieutenant-general and appointed to the important command. He induced Lord Cornbury, son of the earl of Clarendon and brother-in-law of James, to join William, and soon followed him, accompanied by several military men, and by the duke of Grafton, an illegitimate son of Charles II. His example was followed by Prince George of Denmark, while Lady Churchill found no difficulty in persuading Anne to leave London, and to join the northern insurgents. The influence of the Churchills was employed to induce Anne to waive her superior claim to the throne over William. For this Lord Churchill received valuable appointments, and was made earl of Marlborough. In the subsequent disputes between William and Anne he sided with the latter. He was sent in 1689 to command the British forces in the Low Countries, and repulsed the French at Wacourt. The next year he led an army to Ireland, and took Cork and Kinsale. He early began a correspondence with the exiled king, and completely deceived him. His object was not to aid James, but to overthrow William III., place Anne at the head of the nation, and rule her and England through his wife. In 1692 he was dismissed from his employments, and sent to the tower, where he remained for some time. He sent to James an account of the expedition against Brest, which enabled the French to defeat the English with great slaughter, one of his objects being to ruin Talmash, a military rival, who lost his life on the occasion. After the death of Queen Mary, Marlborough was restored to favor, and made governor to the duke of Gloucester, Anne's son. At the beginning of the war of the Spanish succession he was appointed commander of the forces in Holland, and ambassador to that country. He was very successful as a diplomatist, and the king, in anticipation of his death, recommended him to Anne as one most competent to advise and command. When Anne became queen regnant (1702), Marlborough was made captain general and master of the ordnance, and a knight of the garter. Lady Marlborough received several valuable appointments in the royal household, and two of her daughters were made ladies of the bedchamber. Through his own influence with Godolphin, the prime minister, who was his son-in-law, and that of his wife with the queen, Marlborough now practically ruled the kingdom. As ambassador to Holland, he completed the arrangements for the declaration of war against France, and was appointed generalissimo of the armies of the grand alliance, when he entered upon a surprising career of victory. After various successes, the campaign of Blenheim, in cooperation with Prince Eugene, took place in the summer of 1704, and on Aug. 13 the battle of that name was won. He had previously been made a duke, and now the manor and honor of Woodstock were conferred upon him, and the queen ordered that a palace should be there built for him. Siegen-Stromburg. He was successful in the operations of 1705, when the German emperor conferred
upon him the lordship of Mindelheim, with the title of prince. The battle of Ramillies was won May 23, 1706. Other successes marked this campaign, and the duke received a pension of £5,000, and other rewards. The campaign of 1707 was marked by no striking event where Marlborough commanded; but on July 11, 1708, he won the battle of Oudenarde. Lille was taken the same year. Efforts to restore peace having failed, the war was resumed, and on Sept. 11, 1709, Marlborough, aided by Eugene, won the battle of Malplaquet, the most sanguinary and hardly contested of all his victories. His last campaign, in 1711, when he captured the fortress of Boucain, was the most brilliant and effective of all. In the mean time great changes had taken place in England. The war had been commenced by a Tory ministry, though it was in support of whig views. Gradually everything changed. Godolphin became a whig, and the great offices passed into whig hands. In 1707 the change was complete, though the queen's sympathies were with the Tories. The duchess of Marlborough, who was a whig at the time her husband was a Tory, bent all her energies to the support of the ministry, and if her tact had equalled her talent that ministry might have lasted through the queen's life. But the queen at length became weary of her imperious sway, and Mrs. Masham, a cousin of the duchess, whom she had placed in the service of the queen, was used by Robert Harley as a tool to effect her downfall. The ministry of Godolphin was overthrown (1710), the duchess was dismissed, and Harley, as earl of Oxford, became the head of a Tory cabinet (1711). This was followed by the removal of Marlborough from all his offices (Jan. 1, 1712). It was even intended to proceed against him legally on a charge of embezzling the public money. Government ceased to pay the cost of building Blenheim, and that palace was completed out of the funds of the duke. The German government treated him with equal inconsideration, as his principality had been lost through the restoration of the elector of Bavaria. At the close of 1712 he left England, and visited Flanders and Germany, residing principally at Aix-la-Chapelle, Frankfort, and Antwerp. The ill treatment he had received from the Tories caused him to become a firm friend of the Hanoverian succession. He corresponded with the elector, offered him a large loan, and used his influence with Holland in behalf of the Protestant succession. He returned to England on the very day of the accession of the house of Hanover, and was well received by the people, the nobility, and the army. He was appointed a privy councillor, and on the arrival of George I. was made captain general of the army and master of the ordnance. He was prompt in his measures during the rebellion of 1715; but it is said that he sent money to the pretender. His health was now on the decline, and he experienced more than one paralytic shock. Still his mental powers were not affected. He attended parliament even in the last year of his life, and also performed various military duties. He offered to resign his offices, but the king would not hear of it. He was seized with palsy in June, 1722, at Windsor lodge, and died eight days before the completion of his 72d year. He had a magnificent funeral, and his body was deposited in Westminster abbey, whence it was removed to Blenheim, and placed in a noble mausoleum, the work of Rysbrack. The duke left no son, and his title passed to his eldest daughter, Henrietta, countess of Godolphin, from whom it descended to her nephew, Charles Spencer, earl of Sunderland. He left enormous wealth, his income at the time of his death being £270,000, exclusive of what he drew from royal gifts. He was doubtless the most adroit statesman and most successful commander of his time.—The duchess survived him 22 years. Though there is much exaggeration in the ordinary accounts of her violence and quarrels, it is undeniable that her life was not of that dignified character which would have been becoming in one of her station. She could be liberal, and aided Child, the banker, whom the bank of England was seeking to ruin, by giving him an order on that institution for £100,000. She gave Hooke £25,000 for assisting to write her "Account of her life and conduct" (2 vols. London, 1747). She died Oct. 18, 1744, in her 85th year. Her immense wealth was left principally to Charles, duke of Marlborough, and to his brother, John Spencer. Among her bequests was one of £20,000 to Lord Chesterfield, and another of £10,000 to the elder Pitt.—In 1845-6 the "Letters and Despatches of the Duke of Marlborough" were published in 5 vols. 8vo, edited by Sir George Murray. The best biographies of the duke of Marlborough are by Coxe, "Memoirs of John, Duke of Marlborough" (3 vols. 4to. London, 1817-19, and 3 vols. 8vo, 1848), and Alison, "Life of John, Duke of Marlborough" (2 vols. London, 1847). The "Life of the Duchess of Marlborough" has been written by Mrs. A. T. Thomson (2 vols., London, 1839), and by Miss Costello, in vol. iv. of "Eminent Englishwomen" (1844).

MARLIANI, Aurelio, count, an Italian composer, born in Lombardy about 1803, killed in Bologna in June, 1849. He joined the carbonari, lost his fortune in their service, and was obliged to take refuge in Paris. There he became a teacher of singing, and Julia Grisi was his pupil. After the revolution of 1848 he returned to Italy, and took up arms with the revolutionists. He composed many songs and romances and several operas, the best known of which, Le bravo, was produced at Paris in 1834 and at Vienna in 1835.

MARLITT, E. See JOHN, EUGENIE.

MARLOWE, Christopher, or Kit, an English dramatic poet, born in Canterbury in 1564, killed in Deptford, June 16, 1593. His father, a shoemaker, obtained for him admission into
King's school, Canterbury. He was afterward entered as a pensioner of Corpus Christi college, Cambridge, where he received the degree of bachelor of arts in 1583 and of master in 1587. In 1586 he produced the first part of his tragedy of "Tamburlaine," which exhibits more action on the stage, a more dramatic dialogue, and a far more varied and skilful versification, than any English play which had preceded it; but it was ridiculed for its bombastic style and extravagant scenes. It was printed with a second part in 1590. His second play was the "Tragical History of the Life and Death of Dr. Faustus," a powerful though irregular drama, its poetical beauties being often intermingled with low buffooneries. The hero makes a pact with Lucifer, to whom he disposes of his soul on condition of having a familiar spirit and unlimited power at his command for 24 years. The awful melancholy of the bend, as contrasted with the malignant mirth of Goethe's Mephistopheles, the struggles of awakened conscience in the hero, and the splendid horror of the termination, are its most striking features. The German puppet play constructed from this drama was the foundation of Goethe's great tragedy, which consequently in the opening has a striking resemblance to Marlowe's. "The Jew of Malta" has more vigorous passages than are to be found in any other Elizabethan play except those of Shakespeare. His "Edward II." contains a death scene which Charles Lamb says "moves pity and terror beyond any scene, ancient or modern." Several other plays of doubtful authorship have been attributed to him, and it is probable that the second and third parts of Henry VI. in Shakespeare were mostly written by Marlowe. He also made translations from Ovid, so licentious that the archbishop of Canterbury ordered them to be burned, yet they have been often reprinted. He is supposed to have been an actor as well as playwright, led a dissipated life, is stated to have held atheistical opinions, though there is no proof of this in his plays, and died from a wound received in a disgraceful quarrel. An edition of his works by Alexander Dyce was published in London in 1850, in 3 vols.

MARMARA, Sea of. See MARMOR.

MÁRAMOROS, a N. E. county of Hungary, bordering on Galicia, Bukowina, and Transylvania, and the counties of Bereg, Ugoesa, and Szatmár; area, 3,998 sq. m.; pop. in 1870, 220,506, including about 300,000 Ruthenians, 50,000 Wallachs, 20,000 Jews, 15,000 Magyars, and 8,000 Germans. The United Greek church is the most numerous, there being only about 15,000 Roman Catholics and 6,000 Protestants. Mármaros is next to Bihar and Pest the largest county of Hungary, but far more thinly populated. The Carpathians separate it from Galicia, Bukowina, and Transylvania, and traverse it in many directions, the highest peaks rising to an altitude of 7,000 ft. At the foot of Mt. Csorna rises the Black Theiss, which joins the White Theiss in this county. Iron, lead, marble, alabaster, coal, and crystals are found, and in a few localities also gold. The Mármaros diamonds are celebrated. The salt mines are immense. The Suliguli is the most important of the mineral springs. The forests are rich in wood, especially oak. Horses and sheep are raised in great numbers. Excepting the limited valley of the Theiss, the country does not favor the production of cereals, fruits, and wine, and maize is the principal grain raised for local consumption. Capital, Sziget.

MARMIER, Xavier, a French author, born at Pontatlier, June 24, 1800. He studied the German and other foreign languages, and became editor of the Revue Germanique. From 1836 to 1838 he explored northern Europe, on board of a national ship of war, and was professor at Rennes from 1839 to 1841, when he received the appointment of librarian in the ministry of education, which permitted him to travel in the East, in North and South America, and in other countries. In 1846 he was placed in charge of the Ste. Geneviève library, and in 1870 was elected to the academy. He has translated Goethe's and Schiller's plays and other German works, and published miscellaneous writings, some of which relate to the history, language, and literature of Iceland, Denmark, and Sweden. His best novels, Les fiancés du Spitbergh (Paris, 1868) and Gudiza (1860), received academical prizes. Among his books of travel are: Lettres sur le Nord, Danemark, Suisse, Laponie, Spitbergh (1849; 5th ed., 1847); Du Rhin au Nil (2 vols., 1847); Lettres sur la Russie, la Finlande et la Pologne (2 vols., 1848); Lettres sur l'Amérique (2 vols., 1852); Lettres sur l'Adriatique et le Monténégro (2 vols., 1854); Voyage pittoresque en Allemagne (2 vols., 1858–9); En Amérique et en Europe (1859); and Souvenirs d'un voyageur (1867). Among his more recent publications is the story book, L'Arbre de Noël (1871).
division. He participated with credit in the campaign of 1805 in Germany, and in 1806 was made commander-in-chief of the forces in Dalmatia, where he remained till 1809. For his successful defence of Ragusa against a greatly superior force of Russians and Montenegrians, Sept. 30, 1806, he subsequently received the title of duke of Ragusa. After the battle of Aspern and Essling (May 21, 22, 1809) he brought up his corps in good order to the assistance of the emperor, defeating on the way superior bodies of Austrians in several encounters; and for his conduct at the battle of Wagram and in the subsequent pursuit of the enemy, he was created a marshal of the empire. In 1811 he was sent to relieve Masséna in Portugal, and he ended a series of unfortunate movements by losing the battle of Salamanca, which ruined the French cause in the Peninsula. Having recovered from a severe wound received on this occasion, he joined the emperor in Germany in 1813, and fought at Lithen, Bautzen, Dresden, and Leipsic, with a valor which in some degree retrieved his military reputation. In the campaign of 1814 he vigorously co-operated with Napoleon in the brilliant but useless series of battles by which the advance of the allies was sought to be stayed, and on March 29 arrived with the remnant of his corps before Paris. At the battle of Paris, fought on the succeeding day, he showed the utmost intrepidity and devotion to the imperial cause, and, with the few thousand men composing his own corps and that of Marshal Mortier, withstood for many hours the attacks of an army four times as numerous. An armistice was finally agreed upon, and late in the day Marmont, availing himself of a letter from Joseph Bonaparte, who had been appointed lieutenant general of the empire, authorizing him to enter into an arrangement with the allied sovereigns, agreed to evacuate the city. On the 31st the allies entered Paris in triumph; and four days afterward Marmont, influenced by a senatus consultum declaring Napoleon's forfeiture of the throne, and abolishing the right of succession of his family, gave in his adhesion to the provisional government which had been formed under the presidency of Talleyrand; stipulating, however, that the life and personal freedom of Napoleon should be secured, and that the French troops should be provided with secure quarters in Normandy. On April 5 his corps, numbering 12,000 men, accordingly entered within the allied lines and took the road to Normandy. The indignation of Napoleon at this proceeding was boundless; and, in an order issued from Fontainebleau immediately after the news reached him, he expressly disavowed it, observing: "The emperor cannot approve the condition on which the duke of Ragusa has taken this step; he cannot accept life and liberty at the mercy of a subject." During the hundred days he expressly excepted him from the imperial act of amnesty, and subsequently at St. Helena, speaking of his defection, said: "I was betrayed by Marmont, whom I might call my son, my offspring, my own work." He received numerous distinctions from the Bourbons after the first and second restorations, but about 1825 retired to his country seat, whence, in July, 1830, he was suddenly summoned to Paris to quell the revolt against Charles X. Failing in this, he was obliged to share the exile of the Bourbons; and so strong was the odium excited against him, that his name was struck from the list of the French army. He never reentered France, but wandered over Europe, fixing his residence finally at Venice, where his latter years were passed. He published his travels in Hungary, southern Russia, Syria, Egypt, &c., and *Esprit des institutions militaires*, which Marshal Bugeaud wished to place in the hands of every officer in the service; and left an autobiography, published in Paris under the title of *Mémoires du due de Marmont* (2 vols. 1830-31).

**MARMONTEL, Jean François**, a French author, born at Bort, Limousin, July 11, 1723, died at Abbeville, near Evreux, Dec. 31, 1799. Of humble birth, he was educated gratuitously under the Jesuits of Mauriac, and was intended for the priesthood. His love of literature prevented this career, and also withdrew him from commerce, in which his father sought his establishment, and he became professor of philosophy at Toulouse, where his verses took the prize of the floral games. Voltaire, with whom he began a correspondence, induced him to remove to Paris in 1745, where he soon obtained the prize of the French academy for a poem, and produced several tragedies which the genius of Mlle. Clairon made eminently successful on the stage. Protected by Mme. de Pompadour, he became in 1753 historiographer of the royal buildings, and in 1758 publisher of the *Mercure de France*, and thus had a large income. To the *Mercure* he contributed the *Contes moraux*, on which his fame chiefly rests, and which have been greatly admired as specimens of light and lively writing. His position as manager of the *Mercure* was lost after two years in consequence of a satire on the duke d'Airmont, and he was confined for a few days in the Bastile. Admitted into the academy in 1768, he succeeded D'Alambert in 1783 as perpetual secretary. He left Paris during the revolution, was one of the moderate deputies in the council of the ancients in 1797, and lived again in retirement after the 18th Fructidor. His best theatrical pieces are the tragedies *Les Héraclides* and *Numítor*, the operas *Didon* and *Pénélope*, and the comic operas *Sylvain* and *Zémire et Azour*. He also wrote the romances *Béatrix* (1739) and *Les Incas* (1777), collected his articles in the *Encyclopédie* under the title of *Éléments de littérature* (6 vols. 1757), published a history of the regency of the duke of Orleans, and left treatises, designed for the education of his children, on the French language, logic, metaphysics, and morals, and his own
MARMORA

Mémoires (4 vols., 1804). A complete edition of his works was published in 18 vols. (1808), and a select edition in 10 vols. (1824).—His son, Louis Joseph, born in Paris in 1789, published two poems of his father, Polémmie and the Neuvaine de Cythère, and wrote several poems. He went to Mexico, and subsequently to the United States, leading a vagrant life, and died in a hospital in New York in 1830.

MARMORA, Sea of (anc. Propontis), a body of water lying between European and Asiatic Turkey; length 173 m., greatest breadth about 50 m. Its N. E. extremity is connected with the Black sea by the Bosporus, and its S. W. extremity with the Archipelago by the Dardanelles. It is remarkable for its depth, which in some places is more than 350 fathoms. It has numerous excellent harbors on its N. shore, contains several islands, the principal of which is Marmora, and receives the waters of many but inconsiderable tributary streams. It has no tides, but currents of variable strength and velocity run through it. (See Black Sea, vol. ii., p. 688.) Its shores present a picturesque aspect, and are especially bold and precipices on the Asiatic side.—The Island of Marmora (anc. Proconnesus; Turk. Marmar Adassay), which gives name to the sea, is about 12 m. long and 6 m. wide, and for the most part mountainous and barren. It has been celebrated from a remote age for its marble (whence its name, from Lat. marmor), with which in ancient times it supplied Cyzicus and other Hellenic cities, as in modern times it has supplied Constantinople. The capital, Marmora, stands on the S. W. coast, and is chiefly built of wood. The highest summit of the island is in lat. 40° 36' N., lon. 27° 35' E.

MARMOSET, the common name of the South American monkeys of the family hapalidae, including the genera hapale (Illiger) and midas (Geoffroy). The number of teeth is the same as in the old-world apes and in man, viz.: incisors 4, canines 2, and molars 4, with acute tubercles. They are all of a size, resembling squirrels in form and agility; the rounded head is frequently furnished with ear-like tufts of silky hair on the sides; the feet are five-toed, the posterior having an opposable thumb with a flat nail, all the other fingers of both extremities having sharp claws, with the anterior thumb scarcely opposable; the tail is long and bushy, but not prehensile, and the body is covered with soft woolly fur.—In hapale the muzzle is short; the facial angle 50'; the upper lateral incisors insulated, the lower the longest, narrow, and convex outward; lower canines smallest. The striated marmoset or ouistiti (H. jacchus, Ill.) is about 8 in. long, and the tail about a foot; the general color is a deep gray, with the lower back and tail banded with brown, head chestnut, spot on forehead and long hairs on cheeks and behind the ears white. It is a handsome and cleanly animal, walking on all-fours, and like the rest of its family lives in the woods of Brazil, running

about in the trees in pursuit of insects, fruits, small birds, and eggs; it is easily tamed, and makes an interesting and affectionate pet; in captivity it will eat almost any vegetable or animal food; it is not so intelligent as the other

Monkeys; it breeds occasionally in confinement.

—in midas the lower incisors are short and broad, and the forehead more prominent; the species are commonly called tamarins, and include some of the smallest and prettiest monkeys. The silky marmoset, or marikiva (M. rosalia, Geoffr.), is of a golden yellow color, sometimes with a reddish tinge, the fur being very soft and silky and forming a kind of mane upon the neck; its disposition is gentle, but its constitution is so delicate that it soon dies from the exposure of even temperate cli-
MARMOT, a large rodent of the squirrel family, and genus arctomys (Schreber). The body is thick and compressed, the head large and flattened, the legs short and stout, and the tail short, bushy, and nearly cylindrical; the incisors are less compressed than in the squirrels, smooth in front and rounded; the molars are 2½; enamelled continuously, with transverse pointed tubercles, the first upper one the smallest; the ears are short and rounded, but distinct above the fur; the fore feet with four toes armed with sharp claws, and a very rudimentary thumb with a small flat nail instead of a claw; the hind feet five-toed, with strong curved claws; the soles are entirely naked; there are several shallow cheek pouches. The common European marmot (A. marmota, Schreb.) is 18 in. long, the tail 2½ in.; the color is yellowish gray, with the top of the head dark gray, russet at the base of the tail, and incisors yellow. The form is clumsy, the movements slow, and the sagacity small; inhabiting the mountains of Europe near the snow line, they live in families in burrows, in which they pass the winter in a state of lethargy; the food is vegetable, during the search for which one animal is stationed as a sentinel near the burrow, into which all retreat at the signal of danger; the circular chamber for the family is approached by a narrow gallery 5 or 6 ft. long; they hibernate on beds of dried grass, and are very fat at the beginning and very lean at the end of this season; when fat they are sometimes used by the mountaineers as food. The Polish marmot (A. bobae, Pall.) is somewhat larger, with more reddish tints. They burrow in the plains of less elevated districts in Poland, Russia, and northern Asia; they prefer dry and stony soils, into which they dig very deeply, living in families of 30 or 40, and amassing large quantities of dried grasses. Other marmots are described, which occasionally, as perhaps do all, feed upon birds and small quadrupeds. For the American marmot (A. monax, Gmel.) see Woodchuck, its common name. Many animals of the allied genus spernophilus (Cuv.) are sometimes called marmots, but such come more properly under the head of prairie squirrels. The fur is thick and not very coarse, and is considerably used for common caps, robes, and similar objects.

MARNE (anc. Matrana), a river of France, which rises in the department of Haut-Marné, and, after a N. W. course of about 280 m., falls into the Seine near Paris. Its principal tributaries are the Ornain, Blaise, Petit-Morin, and Grand-Morin. The chief cities on its banks are Langres, Chaumont, Jouvville, St. Dizier, Vitry-le-François, Chalons, Epernay, and Meaux. It is navigable from its junction with the Seine to St. Dizier, 210 m. The Marne is connected with the Rhine and Aisne by means of canals.

MARNE, a N. E. department of France, in Champagne, bordering on Aisne, Ardennes, Meuse, Haute-Marne, Aube, and Seine-et-Marne; area, 3,159 sq. m.; pop. in 1872, 286,157. The surface is an inclined plane, sloping from E. to W., and diversified by a few hills of moderate elevation. It is divided into two nearly equal parts by the river Marne, whence it derives its name. The land adjoining this river is rich, but the soil elsewhere is in general light and barren. The principal rivers, besides the Marne, are the Aisne, a stream, and Vesle in the north, and the Aube and Seine in the south. Great quantities of wine are made, mostly champagne. The most important manufacture is that of wool, which centres chiefly at Vitry-le-François, and St. Aignan, the department is divided into the arrondissements of Chalons-sur-Marne, Epernay, Rheims, Ste. Menehould, and Vitry-le-François, Capital, Chalons-sur-Marne.

MARNE, Haute. See HAUTE-MARNE.

MARNIX, Philip van. See ALDEGONDE, SAINTE.

MAROCHETTI, Carlo, baron, an Italian sculptor, born in Turin in 1805, died in Paris, Dec. 28, 1867. He studied in Paris and Rome, and after 1848 went to London. Among his principal works are: "The Fallen Angel" (1851); a bronze statue of Emanuel Phillibert, duke of Savoy, erected at Turin (1848); equestrian statue of Napoleon III., Turin, 1844; "Sappho" (1850); Richard Corne de Lion, at London (1851); "Cupid and Greyhound" (1854); equestrian statue of the queen, at Glasgow (1854); and statue of Wellington, at Strathfieldsay (1866). He was employed in a large number of monumental works, such as "The Battle of Jemmapes," a bass relief on the Arc de l'Étoile, and the tomb of Napoleon in the Invalides, Paris; monument to the British soldiers buried at Scutari, in London; monument to the officers of the Coldstream guards who fell at Inkerman, in St. Paul's cathedral, London; and a monument to the princess Elizabeth, daughter of Charles I., in Newport church, Isle of Wight. He also executed a large number of portrait busts, among the best of which is one of Prince Albert. He was ennobled by Charles Albert of Sardinia in 1838, and was elected a member of the royal academy in London in 1866.
MARONITES, a body of Syrian Christians who acknowledge the spiritual supremacy of the Roman pontiff. The name appears to have been derived from St. Maron or Maroun, a hermit who lived in the mountains near Tyre, and whose feast is celebrated on Feb. 9. His followers built a monastic stronghold on the banks of the Orontes, near Apamea, which bore his name and became during the early Mohammedan wars the refuge of the Syrian Christians. Another Maron, a Monothelite bishop of the 7th century, induced the greater number of the Syrian Christians to embrace his opinions; and from him also they were called Maronites. Finally John Maron, a monk of the monastery of Apamea, was appointed in 676 bishop of Botrys and patriarch of the orthodox Maronites. This similarity of name has occasioned no little confusion among the church historians of Syria.—The Maronites chiefly inhabit the mountain chain of Lebanon between Tripoli, Tyre, and the lake of Gennesaret. Their chief seat is in the district of Kesrawan. Their early history is enveloped in much obscurity. It is certain, however, that when the last Byzantine troops were withdrawn in 685 from the Syrian fortresses, the Christians held the entire range of mountains from Antioch to Jerusalem; and there they continued to dwell under chiefs of their own, repelling every attack of the Saracens, and affording an asylum to the persecuted Christians of the surrounding provinces. With the original Druse population and the Mohammedan recusants who joined them from time to time, the Maronites appear to have lived in peace. (See Druses.) A force of Maronites in 877 helped to defend Syria against the Saracens. At the epoch of the crusades they rendered valuable service to the Christian armies. In 1182 a part of the Monothelites abjured their errors before Amaury, Latin patriarch of Antioch; but their union with the Roman church was not formally effected till 1445. They were allowed to retain their own liturgical forms and peculiar customs. This sentiment of uniformity afterward occasioned much trouble in Italy, where large numbers of Maronites had settled. Some of them took refuge in Corsica, to be beyond the reach of the inquisition, and others found an asylum among the Waldenses in Piedmont. The French kings always maintained a connection with the Maronites, who sometimes called themselves the Franks of the East; and after Richelieu had contracted a close alliance with the Turks, a kind of French protectorate was kept up over the Syrian Christians through the consuls resident at Beyrout. In 1713 the united Druses and Maronites were governed by the Mohammedan family of Shehab, under whose leadership the mountaineers successfully resisted the attempts then made by the Porte to reduce them to submission. But in 1756 the conversion to Christianity of several Shehab emirs caused much feeling among the Druses. This spirit, of religious antagonism was fostered by the Turkish authorities, who were thus enabled, by playing off one sect against the other, to reduce the mountaineers to partial subjection. When the Druses took up arms to resist Ibrahim Pasha’s attempts to reduce them and the Maronites to the administrative conditions imposed on the rest of the population, the Maronites held back till it was too late; their tardy revolt alienated their Egyptian governors without appeasing the resentment of the Druses. The same vacillating policy was manifested when Syria was restored to the Turkish government in 1841. The appointment of Kassim, the son of the deposed Emir Beshir, a Christian, as governor of the Lebanon created dissatisfaction among the Druses and the Turkish inhabitants of Syria. In September and October of that year the Druses rose in arms against the Maronites, and much bloodshed occurred; but the Christian villages were saved from destruction by the timely interference of the English and Turkish authorities. The latter, nevertheless, were notoriously favorable to the Druses. A personal quarrel in August, 1859, between a Druse and a Maronite became the occasion of a war of extermination. (See Druses.) In October, 1860, an international commission met in Beyrout, which on June 9, 1861, agreed to a formal treaty concerning the administration of the Lebanon. Since then a special governor, appointed by the Porte, resides at Deir el-Kamr.—The Maronites now (1874) number about 140,000. They subsist by agriculture, are generally poor, live frugally, and their sheiks are but little richer than the mass of the people. They hold property to be sacred, and are strictly honest and hospitable. In religious matters they are governed by a patriarch residing at Kanobin, assisted by bishops. They elect the patriarch, subject to confirmation by the pope. The Maronite priests are married, and number 1,250, with 400 churches. Of the 200 convents scattered through the Lebanon district, one half belong to the Maronites. Their monks, variously estimated between 20,000 and 25,000, follow the rule of St. Anthony. Their dress is a black cassock, with a hood and leathern girdle. They are forbidden the use of tobacco and flesh meat. The nunneries are built at a distance from the convents, no intercourse being allowed between them save for the administration of the sacraments. The liturgy, which is called St. Ephraem’s, is the Syriac liturgy of St. James, modified by Ephraem Syrus. Communion is administered in both kinds, the consecrated bread being cut into small pieces, thrown into the wine, and placed with a spoon in the mouth of the communicant. The Gospels and other portions of the Scriptures are read and expounded to the people in Arabic, which is their vernacular.—See Churchill, “Druse and Maronite” (London, 1864).

MAROONS, fugitive slaves in the European colonies in the West Indies and in Guiana, who
banded together in the forests and mountains and for a long time maintained their freedom. The origin of the word is uncertain, it being derived, according to one etymology, from the Spanish marrano, "wild hog," these fugitives subsisting at first chiefly by hunting that animal; according to another, from simaran or simarrón, which signifies both an ape and a wild man; and by still a third derivation, from Maroni, a river which separates French from Dutch Guiana, where large numbers of them resided. They are especially celebrated in the history of Jamaica. On the conquest of that island from the Spaniards by the English in 1655, most of the Spanish slaves, about 1,500 in number, fled to the mountains, whence they kept up a guerilla warfare against the whites. Their ranks were continually recruited by runaways; and they became so troublesome that in 1655 the governor, Sir Charles Lyttleton, issued a proclamation offering pardon, freedom, and 20 acres of land to such as should surrender; but it does not appear that any of them accepted the terms offered. The colonial assembly in the course of 40 years passed 44 acts against them, and expended £241,000 in vain efforts for their subjugation. In 1730 they had become so formidable, under a very able general named Cudjoe, that all the militia of the colony and two regiments of regular troops were sent against them. But after seven years' war they were still unsubdued, and in 1737 the colonial assembly imported Indians and bloodhounds from Spanish America to aid in their suppression. Even these failed, however, and at length Gen. Trelawny, the British governor, made overtures of peace to the black chiefs; and on March 1, 1738, the Maroons agreed to a treaty which provided: "First, that all hostilities shall cease on both sides for ever; secondly, that the said Captain Cudjoe, the rest of his captains, adherents, and men, shall be for ever hereafter in a perfect state of freedom and liberty; thirdly, that they shall enjoy and possess, for themselves and posterity forever, all the land situated and lying between Trelawnytown and the Cockpitts, to the amount of 1,500 acres." Beside the arable land thus given them for cultivation, the Maroons had for their hunting grounds the whole mountainous interior of the island. Their game was the wild boar, which abounds in the mountains. They had a method of curing the flesh without salting it, and they sold large quantities of it to the whites, and by this traffic kept themselves well supplied with firearms and ammunition. There were no further hostilities until July, 1795, when a portion of them known as the Trelawnytown Maroons rose in insurrection in consequence of two of their young men having been publicly whipped by the authorities for stealing. The island was put under martial law, although the government had a force of 1,500 regular troops and several thousand militia. After numerous unsuccessful attempts to subdue them, Gen. Walpole by great efforts brought them to be willing to listen to overtures of peace, and suppressed the rebellion in March, 1796. About 600 of them surrendered on assurances of liberty and good treatment, but were peremptorily placed in confinement, and in June suffered various tortures. So severe was the treatment, that in 1800 they were transported to Sierra Leone. Those who remained in Jamaica maintained their independence; but since the abolition of slavery in the island they have to a great extent intermingled with the mass of the colored population. In 1835 it was officially reported that in four of their settlements in Jamaica there were 270 families, or about 1,500 persons. (See Jamaica.)—In the Dutch colony of Surinam, in South America, a band of Maroons was formed at a very early period of the colony in the forests of the interior, but they did not become formidable till about 1726, when they had acquired by pillege lances and firearms. They settled on the upper part of the river Saramaca, and were consequently soon known as Saramaca negroes. Several detachments of soldiers and militia having been sent against them without much success, the authorities in 1730 undertook to terrify them into submission by executing eleven of them who had been taken prisoners. One man was hanged alive by an iron hook stuck through his ribs, two others were burned alive, six women were broken upon the wheel, and two girls were beheaded. These cruelties, however, only enraged the Maroons, and their incursions became so troublesome to the colonists that the government at length resorted to negotiation, and a treaty of peace was formally concluded in 1749, between the governor of Surinam and the Maroon chief, Captain Arobe. From some misunderstanding between the parties, this truce was not of long continuance, and fresh revolts broke out among the slaves on the Oua river, so that in a few years the colony was reduced to the greatest distress by their incursions; and in 1757, after being defeated by the negroes in several encounters, the Dutch again sued for peace. After a long negotiation and four different embassies from the Europeans, a treaty was concluded in 1761, by which the Oua and Saramaca Maroons were admitted to be free and independent, and the colony agreed to pay them an annual allowance to secure their friendship. After some years a revolt occurred among the negroes on the Cotiea river, which gained such force in 1772 that the colonists were forced to abandon their plantations and take refuge in Paramaribo until assistance arrived from Holland. A force of 1,500 Dutch troops, assisted by several hundred negroes liberated and armed for the purpose, at the same time drove the Maroons into the woods. With additional troops from Holland a systematic attempt was now made to subdue the Maroons, but without success; and at the end of a war which lasted several years the colonial government withdrew from the contest. The Maroons at that time were about

15,000 in number. In 1831 they had increased to 70,000, and at present they are still more numerous. They form an independent republic, with laws and customs of their own. Christianity has made little progress among them, and their language is a jargon of African and European tongues intermingled.—For an account of the Maroons of Jamaica, see Bryan Edwards, "History of the West Indies," and Dallas, "History of the Maroons," and for the Maroons of Surinam, see Stedman's "Surinam."

MAROS, a river of Hungary, which rises in Transylvania, near its E. frontier, flows N. W., S. W., and finally W., enters Hungary proper, and after a course of about 400 m. falls into the Theiss near Szegedín. Its principal affluents are the two Kokels in Transylvania, in which country its banks offer much picturesque scenery. The chief towns on its banks are, in Transylvania, Saxon Regen, Maros-Vásárhely, the principal town of the Szeklers, and the fortress Carlisburg; and in Hungary, Ménès, Arad, and Makó.

MAROS-VÁSÁRHELY, a town of Transylvania, capital of the district of Maros, on the river Maros, 50 m. N. E. of Hermannstadt; pop. in 1870, 12,678. It has a fortified castle, with barracks, five churches, among them a Gothic Evangelical church, a Franciscan convent, a gymnasium, a seminary, a library of 60,000 volumes, and a valuable cabinet of minerals. Here the Austrians, on Nov. 15, 1848, obtained a victory over the Szeklers. The town was shortly after occupied by Gen. Beni.

MAROT, Clémence, a French poet, born in Cahors in 1495, died in Turin in September, 1544. He succeeded his father Jean Marot, who was also a poet, as valet-de-chambre to Francis I., whom he accompanied to Italy, and was wounded and made prisoner at the battle of Pavia in 1525. On recovering his liberty and returning to Paris, he was imprisoned for a time on the charge of heresy, at the instigation, as has been stated, of Diana of Pitières. In 1535, the charge being revived, he retired to the court of Margaret, titular queen of Navarre, and went thence to Ferrara and Venice. In 1536 he returned to Paris, having abjured the heretical doctrines at Lyons. His metrical translations of the Psalms, which were very popular, and were sung by the king and the whole court, being condemned as heretical by the Sorbonne, he again fled in 1543 to Geneva, where he added 50 psalms to the 30 previously published. He then went to Turin, where he died in great poverty. His poems consist of epistles, rondeaux, ballads, epigrams, &c. His most important longer productions, besides the translations of the Psalms, were L'Enger, a satire upon the lawyers, and a new version of the Roman de la rose. His son Michel was also a poet, though much inferior to him; and a complete edition of the works of the three Marots was published at the Hague in 1731, in 4 vols. 4to. The works of Clément Marot have been frequently reprinted.

MARQUEE, Letter of. See Privateer.

MARQUESAS ISLANDS, or Mendaña Archipelago, a cluster of 13 small islands in the South Pacific ocean, between lat. 7° 45' and 11° S. and long. 138° and 141° W.; aggregate area, 480 sq. m.; pop. in 1864, about 10,000. They are generally divided into a southern and a northern group. The former (Hwanoa, Tahhata, Motane, and Fatuhiva) was discovered in 1566 by the Spaniard Mendaña de Neyra, and by him named Las Marquesas de Mendoza in honor of the viceroys of Peru, the marquis de Mendoza. Of the northern group, discovered by Captains Marchand and Ingraham in 1791, the largest islands are Nukahiva, Uahuga or Washington, Uapoa or Adams, Shotomiti or Franklin, and Fatuahu. They are of volcanic origin, a fact which is attested by long rows of bleak basaltic rocks. Each island is formed by a mountain ridge, which rises to an elevation of 2,000 or 2,000 ft., sending forth numerous lesser chains, between which fertile valleys open toward the ocean. The coast is for the most part rugged and precipitous, and the woodlands being unprotected furnish no safe anchorage. The climate and productions resemble those of the other volcanic islands of subtropical Polynesia. The rainy season lasts from November to April. Droughts are not unfrequent during the hot season; Krusenstern mentions one which lasted for ten months. The valleys, the soil of which is formed by hundreds of layers of decayed vegetation, are extremely fertile, and produce all tropical fruits in abundance. The yam, sugar cane, banana, plantain, taro, sweet potato, cotton plant, &c., grow almost without culture. The hillsides are covered with forests of cocoanut, breadfruit, and papaw trees, the fan palm, and numerous other trees; but the vigorous growth of underbrush renders them almost inaccessible. The fauna of the islands is as poor as their flora is rich. There are no indigenous mammalia, but swine, rats, and cats have been introduced from Europe. Of birds there are only four or five distinct species; among them the karukuru and the gupul, a parrot of the size of the robin, are the most beautiful. Water fowl abound on the coast, and valuable mussels are found near the shore.—The inhabitants belong to the Malay race, and are distinguished by grace and symmetry of person. Their complexion is of a light copper color; the women appear almost white, but this complexion is produced by the application of the root of the papaw tree. Tattooing is practised by both sexes. Their social organization is similar to that which prevailed in the Hawaiian islands before the introduction of Christianity. They are divided into many tribes or clans, among whom bloody wars are of frequent occurrence. The tatu serves them instead of religion. The tabooed or privileged classes consist of atua, who are venerated as superior beings; toanas, soothsay-
ers and "medicine men;" tatauauas, priests and surgeons; thus, the lowest rank of the hier-
archy; kataikia, secular rulers; and toas, war chiefs. The non-tabooed classes are the peio pekeios, servants of the chiefs; aerias, fishermen; hokis, singers and dancers; and nokues, common laborers. The last named class held a similar position to that of the pariahs in India. Among the peculiar social institutions of the islanders is polyandry, the woman choosing her husband or husbands, and retaining them or not according to her pleasure. Cannibalism is also practised sometimes, but simply as an act of vengeance; it is only the bodies of slain enemies of which now and then a slice is eaten. Their ordinary food consists principally of vegetables. A highly intoxicating beverage is prepared by chewing the root of the kanoa plant (piper metatiumum), mixing it well with saliva, and then spitting it into a vessel, in which it is perfected by fermentation. The extensive use of this beverage produces leprosy or consumption. Besides these diseases, elephantiasis, scrofula, liver complaints, inflammation of the lungs, and diseases of the eyes, often resulting in blindness, are common among the islanders. Their scanty clothing is obtained from the mulberry tree, the bark of which they render thin and soft by beating, thus forming a kind of coarse cloth. Their habitations, small log huts thatched with leaves of the coconut tree, are erected on stone platforms from 3 to 5 ft. above the ground. In similar houses they bury their dead.—These islanders have no history. Even the first discovery of the islands by Europeans has been entirely forgotten, though the Spaniards, who introduced swine, and also Cook (who in 1774 visited Futuhug or Hood Island) and Marchand, are still venerated as gods. The Marquesas were taken possession of in 1842 by Admiral Du Petit-Thouars, by authority of the French government. The inhabitants afterward made some unsuccessful attempts at re-conquering their liberty. In 1850 the island of Nukaliva was made a penal colony for political convicts. Only one convict was sent there, and the project was abandoned, but the protectorate of France is still maintained.

MARQUETRY—See Beul Waxon.

MARQUETTE. I. A central county of the upper peninsula of Michigan, bounded N. E. by Lake Superior and S. W. by Wisconsin, and drained by the Escanaba, Michigamig, and Mquaumecum rivers and other streams; area, about 3,425 sq. m.; pop. in 1870, 15,033. The surface is diversified and covered by extensive pine forests. It contains granite and limestone, and immense deposits of iron ore, the mining of which is the chief business. It is traversed by the Marquette, Houghton, and Ontonagon railroad, and by the Peninsula division of the Chicago and Northwestern. According to the census of 1870, there were 11 iron mines (the entire number in the Lake Superior region), employing 2,005 hands, and yielding 600,083 tons of ore, valued at $2,677,963. There were 8 blast furnaces, 3 founderies, 3 machine shops, 4 breweries, 3 charcoal factories, and 7 saw mills. The shipments in 1872 were 890,677 tons of ore, and 38,072 of pig iron. Capital, Marquette. II. A S. central county of Wisconsin, intersected by the Neenah or Fox river; area, about 550 sq. m.; pop. in 1870, 8,059. The surface is diversified and the soil good; it contains several lakes. The chief productions in 1870 were 144,562 bushels of wheat, 77,488 of rye, 116,049 of Indian corn, 7,881 of oats, 68,950 of potatoes, 49,508 lbs. of wool, 240,408 of butter, 22,391 of hops, and 20,192 tons of hay. There were 2,220 horses, 3,429 milch cows, 1,103 working oxen, 4,265 other cattle, 16,488 sheep, and 4,312 swine. Capital, Montello.

MARQUETTE, a city, port of entry, and the county seat of Marquette co., Michigan, situated on Lake Superior, at the terminus of the Marquette, Houghton, and Ontonagon railroad, 300 m. N. W. of Detroit, and 320 m. N. of Chicago. Pop. in 1874, 5,343. It is the chief depot of supplies for the iron mines of the upper peninsula, and the principal point of shipment for the ore. There are three blast furnaces and a rolling mill within the city limits, and several furnaces in the vicinity. Marquette is supplied with water on the Holly plan, is lighted with gas, and has an efficient fire department. It has three banks, with a joint capital of $700,000; graded public schools, with four school buildings costing $60,000; a weekly newspaper, a public library, and six churches, viz.: Baptist, Episcopal, Methodist, Presbyterian, and Roman Catholic (two).

MARQUETTE, Jacques, a French explorer, born in Lamo, France, in 1637, died May 18, 1675. At the age of 17 he entered the society of Jesus, and in 1666 sailed for Canada as a missionary. He spent about 18 months in the vicinity of Three Rivers, where he acquired the Montagnais and other dialects of the Algonquin spoken in Canada and New York, as well as the Huron and Iroquois. He was first selected for the Mohawk mission, but in April, 1668, went to Lake Superior and there founded the mission of Sault Ste. Marie. In the following year he was sent to take the place of Allouez among the Ottawas and Hurons at Lapointe; but his stay there was short, these tribes being soon dispersed by the Sioux. Marquette then followed the Hurons to Mackinaw, and there in 1671 built a chapel at the mission of St. Ignatius. In the following year he wrote of his success at Mackinaw to Father Dablou, the superior of the Jesuit missions in Canada. "I am ready, however," he continued, "to leave it in the hands of another missionary, to go on your order to seek new nations toward the South sea who are still unknown to us, and to teach them of our great God whom they have hitherto not known." As early as 1665 he had resolved upon exploring the Mississippi, of which he had heard from the Indians, and had made preparations at Lapointe, his topographical skill being an
important aid. His desire was not gratified till 1673, when Frontenac and Talon, the governor and intendant of Canada, having resolved to
send Louis Joliet to explore the whole course
of the Mississippi, Marquette was instructed to
accompany him. With five other Frenchmen
they left Mackinaw in two canoes on May 17,
and reaching Wisconsin river by way of Green
bay, Fox river, and a portage, floated down to
the Mississippi, on whose waters they found
themselves by the 17th of June. Somewhere
near the mouth of the Ohio (which they called
the Ouaboukigou, from which was formed the
subsequent name of the Wabash) they met
savages who assured them that it was not more
than ten days' journey to the sea, and that they
bought stuffs and other articles of Europeans
on the E. side. Continuing their voyage, they
arrived at a village called Akamsea, probably
about the mouth of the Arkansas. Having
satisfied themselves that they were not more
than two or three days' journey from the
mouth of the river, which undoubtedly em-
tied into the gulf of Mexico or off the Florida
coast, and not, as had been conjectured, in
California or Virginia, they resolved to re-
turn, especially as their further progress would
expose them to the danger of captivity
among the Spaniards. They began their home-
ward voyage on July 17, and, passing up the
Illinois instead of the Wisconsin, arrived in
September at Green bay. They had accom-
plished the object of their mission, and trav-
elled in their open canoes a distance of over
2,500 miles. On the banks of the Illinois Mar-
quette had promised the Kaskaskia Indians to
return and preach to them. He was detained
by sickness at the mission of St. Francis Xa-
vier on Green bay a full year; but in October,
1674, having previously sent to his superiors an
account of his journey down the Mississippi,
he set out with two white men and a number of
savages for the village of Kaskaskia. On
Dec. 14 he was stopped at the portage on the
Chicago by inhabitants and severe cold, and
dismissing the Indians resolved to winter there
with his two companions. Resuming his jour-
ney, March 30, 1675, he reached Kaskaskia
April 8, and at once began a mission by erect-
ing an altar and celebrating the festival of
Easter; but conscious that his end was ap-
proaching, he soon attempted to return to
Mackinaw. He reached no further than a
small river whose mouth is on the E. shore of
Lake Michigan, and which still bears his name,
and there he died in the presence of the two
Frenchmen who had attended him from Green
bay. He was buried on the spot, but in 1677
his remains were carried to Mackinaw. The
narrative of his voyage on the Mississippi was
not published till 1681, when it appeared in an
incorrect form at Paris in Thévenot's Recueil
de voyages, no organized by Marquette. This
narrative, as well as a journal of the missionary's
last expedition, and his autopgraph map, may
be found in Shea's "Discovery and Explora-
tion of the Mississippi Valley" (New York,
1852). His narrative, for some years after its
first publication, was regarded as a fable; but,
although Marqury and others have set up theo-
ries as to an earlier exploration of the Missis-
sippi by Lasalle, they rest on insufficient data
and conjectures, and the claim of Marquette and
Joliet as the first explorers of the great
river of the west, and the first Europeans who
saw it after De Soto, remains unshaken.

MARQUEZ, Leonardo, a Mexican general, born
in the city of Mexico about 1818. Entering
the army at an early age, he was engaged in
several battles in the valley of Mexico against
the American army in 1847. He headed a
pronunciamiento in the state of Guanajuato,
Feb. 10, 1849, declaring the election of Presi-
dent Herrera illegal, and recalling Santa Anna
to the government. The movement was sup-
pressed, and Marquez was made prisoner, but
he was soon set at liberty. After the accession
of Santa Anna in 1853, Marquez was intrusted
with important commands in the war against
Alvarez and Comonfort; and after the flight
of Santa Anna, in August, 1855, he continued
for two years to maintain a guerrilla warfare in
his behalf. During the war of reform he be-
came one of the chief military leaders under
Presidents Zuloaga and Comonfort. He de-
fated at Tacubaya, April 11, 1859, the liberal
forces, which laid siege to the capital under
Degollado, thus saving Miramon from immin-
ent danger, but stained his victory by the execu-
tion of his prisoners, including several
medical students and other non-combatants.
This deed, of which he divides the responsibil-
ity with Miramon, is known as the massacre
of Tacubaya, and brought upon Marquez an
odium from which he has never recovered.
After the triumph of Juarez, Marquez con-
tinued an irregular warfare in 1861, during
which he again stained his reputation by the
execution of his prisoners, Generals Degolla-
dol and Valle, and of the prime minister Ocam-
po. For these deeds he was declared an out-
law by congress, and a price was set on his
head. He united his forces with the French
invaders in 1862, and favored the elevation of
Maximilian to the throne; but that prince was
unwilling to accept his military services, and
gave him an honorable exile as minister to
Turkey. In October, 1866, he returned to
Mexico without permission, and was appointed
to the command of a division. When Maxi-
milian set out for Querétaro in 1867, Marquez
was left in command of the city of Mexico,
which he defended for three months against
Gen. Porfirio Diaz, not capitulating till June
21, two days after the execution of Maximilian.
He secreted himself for several weeks, and at
last escaped to Havana. He is one of three
persons expressly excluded from the amnesty
of 1870. He has published two pamphlets in
defence of his military record.

MARQUIS, or Marques, a title of dignity in
England, France, and Italy, ranking next be-
low that of duke. In Germany, whence it
derives its origin, the corresponding title is
Markgraf, in English marquise or lord of the
marches; and the persons so called or created
were originally military chieftains to whom
was committed the guardianship of the marches
or frontiers of a country. Hence the medi-
 eval Latin word marchio. In continental Eu-
 rope the marchiones, from being mere life oc-
cupants of their office, became at a compara-
tively early period territorial potentates, trans-
mitting their titles and possessions, until they
were established as a powerful hereditary order
of nobility. In England the lords or wardens
of the marches were originally barons or earls,
whose office it was to preserve the frontier
(as on the borders of Wales or Scotland) free
from the inroads of the enemy. The office
was regarded for many centuries as a special
or temporary one, and the term marquis, as
distinguished from other titles of honor, was
unknown till 1865, when Richard II. created
his favorite Robert de Vere, earl of Oxford,
marquis of Dublin for life, and gave him pre-
cedence between the degrees of earl and duke.
The next creation was that of John de Beaufort,
earl of Somerset, who was in 1397 made
marquis of Dorset, and who, after being de-
graded in parliament, where he was only con-
sidered as earl of Somerset, declined to have
the new honor restored to him, on the ground
that "the name of marquis was a strange one
in the kingdom." It was not again conferred
until 40 years afterward, in the reign of Henry
VI. Thereafter it continued to be occasion-
ally bestowed, but was scarcely ever borne by
more than three or four persons at a time until
the latter half of the reign of George III.,
when the number of marquises was made equal
to that of the dukes. In 1874 the number of
marquises who sat under that title in the Brit-
ish house of peers was 21. Of the 20 British
dukes, 11 had also the secondary title of mar-
quis in the English, Scottish, or Irish peerage.

MARRACCI, Ludovico, an Italian orientalist,
born in Lucca in 1612, died in Rome, Feb. 5,
1700. He devoted himself from his youth to
the study of languages, became a proficient in
Greek, Hebrew, Syriac, Chaldee, and Arabic,
and was appointed professor of Arabic in the
Sapienza college, and afterward in the Propa-
ganda, at Rome. Pope Innocent XI. chose
him as his confessor, and would have advanced
him to ecclesiastical dignities had not Marracci
declined. He edited the Koran in the original
Arabic, with a Latin translation (Padua, 1698).

MARRIAGE, in law, the conjugal union of one
man with one woman. In all Christian com-
munities the marriage relation exists, and is
considered as the most solemn of contracts;
and excepting in Protestant countries, it is
regarded as such. In England, although not
a sacrament of the church, it is not only
celebrated as a religious ceremony, but until
very recently it fell almost exclusively under
the cognizance of the ecclesiastical courts.

Since the statute 20 and 21 Victoria, c. 85,
however, the new court of probate and divorce
has exercised some of the functions heretofore
belonging to the ecclesiastical courts, together
with some others, especially in the matter of
divorce, which are quite new in English law.
In the United States marriage is, by law, only
a civil contract; magistrates, equally with
clergymen, have a right to solemnize it; but it
is the prevailing practice of the country to have
it performed by a clergyman, and attended with
religious ceremonies. One very great question
remains in a state of singular uncertainty; it
is: What is necessary to constitute a complete
and valid marriage? or rather, are the cere-
monies and forms, or any of them, which are
indicated by law or are customarily used for
the solemnization of marriage, indispensable,
or is the mere consent of the parties sufficient?
That such a question as this should be unset-
settled both in England and in this country may
well occasion surprise. But the true explana-
tion of the mystery is, we apprehend, that very
few persons have trusted to their own mere
consent for the validity of their marriage, and
the question has therefore very seldom come
directly before the courts. Recently, however,
this precise question has passed through the
English courts. It came first before the court
of queen's bench in Ireland, upon a trial for
bigamy. The defendant was found guilty, and
then, the first of the marriages not having been
solemnized according to the direction if not
requirement of law, the question arose whether
it was so complete and perfect as to make the
crime of bigamy possible. There were four
judges, and they were equally divided. The
chief justice then (against his opinion) joined
pro fide with the two who thought the mar-
riage valid, and the crime of bigamy commit-
ted, for the purpose of having a decision by a
majority, from which an appeal could be made
to the house of lords in England. On appeal
the question of the validity of the marriage by
mere consent was fully argued by the ablest
counsel in England before the lords, and the
six law peers gave their opinions severally,
each at great length; and they were equally
divided, Lords Brougham, Denman, and Cam-
bell being in favor of the validity of the mar-
riage at common law, and Lords Lyndhurst,
Cottenham, and Abinger against it. This equal-
division affirmed the judgment, and the defend-
ant was sentenced. Almost at the same time,
by an odd coincidence, the same question came
before the supreme court of the United States,
and Chief Justice Taney, in deciding the case
(on other grounds), said: "Upon this point
the court is equally divided, and no opinion can
be given." Nevertheless, the steady tendency
of American decisions is in the direction of
the conclusion reached by Chancellor Walworth
(Rose v. Clark, 3 Paige, 574), "that any mutual
agreement between the parties to be husband
and wife is professed, especially where it is
followed by cohabitation, constitutes a valid
and
MARRIAGE

binding marriage, if there is no legal disability on the part of either to contract marriage; and such we believe to be the law. (For marriages void or voidable for fraud, duress, or other cause, see Divorce.)—Contracts to marry at a future time are recognized by law, and the rules of law in relation to them are in some respects peculiar. The promises must be reciprocal, and a woman is bound by such a contract as much as a man. Nor is there anything in the law to prevent an action by the man for a breach of this contract; but such actions are not common, and would not be favored by court or jury. The action may be brought by an infant, but not against one. The very words, time, and manner of the promise are not often provable, and are never indispensible; for precise and direct testimony to the promise is not demanded. Indeed, courts have, in some instances at least, gone quite far enough in instructing or permitting a jury to infer a promise of marriage from rather slight indications. In general, however, language used to third persons expressive of a purpose, or even a promise, to marry the plaintiff, does not prove this promise, unless it was addressed to a parent or to one who stood in the place of a parent. This contract, like every other, may be on condition; and if the condition be reasonable, the law will respect it, and will not sustain an action on the promise unless the condition be performed. The defences to such an action are, generally, either a denial of the promise, or that it be proved, anything which would make the marriage unlawful. But a previous and existing marriage of the defendant, although it would have made his marriage with the plaintiff illegal and void, would not be a defence against this action, if it were unknown to the plaintiff when the agreement to marry was made by her. The defence most usually relied upon is a denial of the promise; and after that, the bad character of the plaintiff. If this be made out, it is a sufficient defence; but if it be attempted and fails, the attempt may be regarded by the jury as a ground for increasing the damages against the defendant. If the defence be a specific criminal act, it must be proved specifically. If it be general bad character, evidence of bad reputation is receiv- able. Neither specific bad conduct nor general bad character constitutes a defence, if it was known to the defendant when he made his promise; although, even then, it might be considered in mitigation of damages. There are decisions for and against permitting the fact of seduction to be received in evidence in an action for breach of contract to marry, for the purpose of swelling the damages. But it generally finds its way into the case; and the question of damages is in this case, more than in most others, entirely within the discretion of the jury. The action does not survive to the representative of a deceased promisee, nor can it be maintained against the representative of a deceased promisor.—Contracts in restraint of marriage are wholly void, by the policy of the law. Thus no action can be maintained on any promise or obligation not to marry; as not to marry any woman but the promisee; or by a widow not to marry again; or a promise not to marry within six years. There is also a class of contracts which, from the frequency with which they appear in English law books, would seem to be not uncommon in that country, and which are called “marriage brokerage (sometimes brocage) contracts.” They are, in general, contracts for the payment of money or transfer of property to some person, by way of compensation for his or her procuring a marriage for the party paying. Such a contract is void on grounds of morality and the public good, without any reference to the expediency or propriety of the marriage itself.—The matrimonial connection variously designated in the laws of the first Christian emperors and the decrees of some early councils as concubinatus and licito consuetudo, was considered by the Roman Catholic church to be a real marriage, though not celebrated with the same solemnity nor attend- ed with the same civil consequences as a contract recognized by both the civil and ecclesiastical courts. It is what in modern times is called “a marriage of conscience,” and what ancient jurists termed semi-matrimonium. It is still called in Germany Halbehe, where the name of half-wife, Halbeheib, is bestowed on a woman to whom, though a real wife, the husband does not convey his rank. This condition responds to that of the semi-uxor of the canonists, who also described such women as uxor sine dote minia solemniter duxta. This sort of union, though discomfited by the Roman Catholic church, was held, when contracted seriously, to be indissoluble. Hence she would not tolerate temporary unions of this kind. Thus, the 17th canon of the first council of Toledo (400) excommunicates all who, having a lawful and acknowledged wife (uxor), presume to have also a concubine; while it admits to communion the man who is contented to live for ever with a wife of inferior rank. The canon merely enforced monogamy. (See Concubinage.)

MARRIAGE SETTLEMENTS. A promise to give or advance to a woman, or settle upon her, money or an estate, on her marriage, is valid; because the marriage is regarded by the law as a sufficient consideration for it. But it must be made in writing and signed, under the English statute of frauds, and wherever that clause is reenacted in this country. A mere representation concerning the pecuniary condition of a party, if made in good faith, will not bind one to make his representations good. Letters from parents or relatives, when sufficiently specific, are held to bind them.—Contracts in fraud of marriage settlements, and intended to defeat them, are void; as a private bargain with the husband, or the husband and wife, that he shall pay back part of her for-
tune; or a promise to restore money lent to give the appearance of wealth, and so procure the marriage; and a note given only to be exhibited and used for the same purpose has been held valid against the promisor. A creditor who conceals or denies his claims, so that the debtor may obtain the consent of the woman or her guardians, is bound by his denial or concealment as effectually as by a release.—As to the power of an infant, especially a female infant, to make a valid settlement of property in view of marriage, the law is not quite settled. An infant of either sex may certainly receive property in such a way; but in an important case in England (18 Vesey, 259), Lord Chancellor Eldon held that a female infant was not bound by her settlement of her estate, but, when she came of age, might annul the settlement and return into possession of all her rights and interests. The opposite doctrine is now established by statute in England, and also by statute or decision in some of the United States.

Marrow, also called Medulla, a soft, translucent, yellowish or reddish vascular substance, found in the central cavities and in the spongy texture of the bones of man and the higher animals. There are two varieties of marrow, the yellow and the red. The yellow marrow is found principally in the central cavities of the long bones, such as the femur, humerus, and tibia. It consists of a very fine fibrous network, in which are imbedded an abundance of fat vessels and capillary blood vessels, together with the ramifications of nerves. It is, however, but little or not at all sensitive in its ordinary condition, although when diseased it may, like other parts of the bone, become exceedingly painful. The reddish variety of marrow is found in the interstices of the spongy texture in the extremities of the long bones, in the short and flat bones, and especially in the sternum and the bodies of the vertebra. It is softer in consistency than the preceding, and contains only slight traces of fat. Besides a delicate fibrous tissue, blood vessels, nerves, and an amorphous albuminous matter, it contains, in the bodies of the vertebra, the sternum, ribs, and cranial bones, small rounded, nucleated cells, the "marrow cells." Marrow does not exist in cartilage, nor in the compact tissue of bone, but is formed in proportion as the medullary cavities are produced by absorption of the original bone.

Marryat. I. Frederick, a British author, born in London, July 10, 1792, died at Langham, Norfolk, Aug. 2, 1848. He entered the naval service at 14 years of age as a midshipman on board the frigate Impérieuse, and participated in 50 engagements, in one of which he was severely injured. He distinguished himself on several occasions by leaping overboard and rescuing drowning shipmates, for which he subsequently received a medal from the humane society. In 1812-'15 he served on the North American coast; and he participated in an action with gunboats on Lake Pontchartrain shortly previous to the battle of New Orleans. In 1829, while commanding the Ariadne in the channel service, he commenced his literary career by the publication of "Frank Mildmay, or the Naval Officer," a novel of sea life, in which many of his early adventures are related. Among his other novels are: "The King's Own" (1830); "The Paenia of Many Tales" (1831); "The Pirate and the Three Cutters" (1835); "Midshipman Easy" (1839); "Japhet in search of a Father" (1836); "Peter Simple" (1837); "Perceval Keene" (1837); "Snarleyyow" (1837); "Jacob Faithful" (1838); "The Phantom Ship" (1839); "Poor Jack" (1840); "Joseph Ruskbrook" (1841); "Masterman Ready" (1841); "The Settlers in Canada" (1844); "The Mission" (1845); "Children of the New Forest" (1846); "The Privatereemen" (1846); "The Little Savage" (1848); and "Valerie" (1849). In 1837 he published a Code of Signals for Vessels employed in the Merchant Service, which has been adopted by England and other governments, and for which he received the cross of the Legion of honor from Louis Philippe. In 1838 he made a tour in the United States, and in 1839 published his "Diary in America," in two series, each of three volumes. During the last two years of his life he was compelled by the rupture of several blood vessels to desist from all professional and literary labor. His "Life and Correspondence" (2 vols., 1872) was published by his daughter Florence (Mrs. Ross Church), who is also the author of several novels.

II. Samuel Francis, son of the preceding, born in 1826, died in London, July 12, 1855. He served several years in the British navy, but resigned his commission, and in 1850 established himself in California. In 1853 he returned to England, and published an account of his adventures under the title of "Mountains and Mole Hills" (London, 1855).

Mars (a contraction of Maxere or Marsere), the Roman god of war, whose name in the Sabine and Oscian tongues was Manners, and who was early identified with the Greek Ares. Before this identification he seems to have been an agricultural rather than a warlike divinity. He was one of the three tutelary gods, to each of whom Numa was said to have appointed a flamen, and he enjoyed the highest honors after Jupiter. He was called Father Mars (Marspiter), being regarded as the parent of the Romans from having begotten the founders of Rome by Rhea Silvia, a priestess of Vesta. He was distinguished as Gradivus, Silvanus, or Quirinus, in his relations respectively to war, agriculture, and the state. The rites of his worship, as the dances of the Salii in armor, had reference to war and victory. The principal temple dedicated to him at Rome were that on the Aonian way outside of the Porta Capena, and that of Mars Ulor in the forum.

-Ares (Ἀρης), son of Zeus (Jupiter) and Hera (Juno), was regarded by the Greeks not
MARS, the fourth planet in order of distance from the sun, and the nearest to us of the superior planets, that is, of the planets whose orbits lie outside that of the earth. Mars travels around the sun in a mean sidereal period of 686,979 days, on an orbit inclined 1° 51' to the plane of the ecliptic, at a mean distance of 139,311,000 m. from the sun; but this orbit is considerably eccentric, insomuch that its greatest distance, 132,304,000 m., exceeds his least, 136,318,000 m., by more than 28,000,000 m. He returns to opposition at intervals separated by a mean period of 779.989 days, which is therefore the planet's mean synodical period. The earth's mean distance being 91,430,000 m., the mean distance of Mars from the earth at the time when the two planets are in conjunction is about 48,000,000 m. But at a conjunction when Mars is near his perihelion, the distance is much reduced, more indeed than by the 13,000,000 m. by which the perihelion distance of Mars is less than his mean distance. For the perihelion of the orbit of Mars lies in lon. 323 1/2°, while the aphelion of the earth's orbit lies in lon. 280 1/2°, so that the earth is about 63° from aphelion when in the same longitude as the perihelion of Mars, and is therefore at a distance from the sun considerably exceeding her mean distance. Without entering at any length, however, into niceties of the sort (which would be idle, since conjunctions do not happen exactly when Mars is in perihelion), we may say that at a conjunction near the perihelion of Mars the distance between the two planets amounts to about 35,000,000 m., while at a conjunction near the aphelion of Mars the two planets are separated by about 61,000,000 m. Accordingly, Mars is studied under very different conditions when he is in opposition (to the sun—that is, in conjunction with the earth) near perihelion and near aphelion. For not only is his apparent disk larger in the former than in the latter case in the proportion of about (61)² to (35)², or more than 3 to 1, but furthermore the planet is more brilliantly illuminated (and will therefore bear telescopic magnifying) in the former case in the proportion of about (192)² to (126)², or nearly 3 to 2. On the whole, therefore, the planet can be more favorably studied in the former case than in the latter in the proportion of about 9 to 2, measuring the conditions by the amount of magnifying due to proximity and to the telescopic powers practically available. To ordinary observation, the effect of the considerations just pointed out is that Mars when in opposition near perihelion looks about 4½ times brighter than when in opposition near aphelion. The opposition of the year 1877 will illustrate this; for during the oppositions which have recently occurred Mars has been far from perihelion, the opposition of 1869 occurring when Mars was nearly in aphelion, and those of 1871 and 1873 being little more favorable. In the opposition of 1875 he will be nearer, but still some 85° from his perihelion. But in 1877 the place of opposition will have been carried more nearly to the perihelion (somewhat past that point) than previously for more than 30 years. He will therefore present a very distinguished appearance in the heavens, being little inferior in brightness to the planet Jupiter. It is indeed a noteworthy circumstance that theoretically Mars should then be brighter than Jupiter, That is, comparing the size of his disk with that of Jupiter, and the amount of light received by the two planets from the sun, Mars should be brighter when he is in opposition near perihelion than Jupiter ever is; but owing either to the inferior reflective quality of the surface of Mars, or more probably to the fact that most of the light of Jupiter is reflected from cloud masses, and that a portion of that light is inherent, Jupiter in opposition is always brighter than Mars ever is.—The diameter of Mars is variously estimated by different observers, but is probably about 4,400 m. The volume of his globe is therefore less than the earth, in the proportion of about 168 to 1,000, or the earth is nearly six times as large as Mars. The mass of the planet is however even smaller in proportion; for his density is estimated at seven tenths of the earth's, and his mass, though less than hers in the proportion of about 118 to 1,000, is nearer one ninth than one eighth of the earth's mass. This small planet rotates on an axis inclined about 25° to the orbit, so that the seasons have a greater range than those of the earth, whose inclination to her orbit is but 23½°. The rotation has been determined with a near approach to accuracy. Cassini, who was one of the first to study the telescopic aspect of Mars, assigned to the planet a rotation period of 24h. 40m. Sir W. Herschel in 1777 attacked the problem with less success than usually attended his work as an observer. He unfortunately missed count of one rotation in a synodical revolution of Mars, and this error, distributed among all the rotations of the revolution (corresponding to about 24h. divided into 759 parts), amounted to nearly two minutes, so that his estimate of the rotation period 24h. 37m. 22s., was about two minutes too fast. Madler, from observations extending over the years 1830-37, deduced a period of 24h. 37m. 23.8s. Kaiser of Leyden, combining his own observations with those by
Mars

Mädler, Sir W. Herschel, and Huygens in 1672, deduced a rotation period of 24h. 37m. 22'65s.
Lastly, the present writer, by combining observations made in 1873 with Hooke's observations in 1666, deduced the period 24h. 37m. 22'73s. As this differed more from Kaiser than could be explained if neither Huygens's observations nor Hooke's had been misunderstood, Kaiser went afresh over his work, and obtaining his former result expressed the opinion that Hooke's observation was untrustworthy. But the present writer, having carefully examined Kaiser's work, found that Kaiser had apparently counted the years 1700 and 1800 as leap years; at any rate, he had somehow counted two days too many in the interval of about 200 years. This excess of one day per century really corresponded to a defect of 37m. 23s., since a Martian rotation too many had been of course introduced along with the extra day, and a Martian rotation requires 24h. 37m. 23s. instead of 24h., so that the additional terrestrial day fell short by 37m. 23s. of what was really required to provide (so to speak) for the added Martian day. Now if we divide 37m. 23s. by the number representing all the Martian rotations in a century, or roughly if we divide 2,250 seconds by 35,000, we obtain about 0'065 of a second; and adding this to Kaiser's value of the rotation period, we obtain 24h. 37m. 22'85s. This is near enough to the writer's value (24h. 37m. 22'73s.) to show that both Huygens's picture and Hooke's can be relied upon, the difference resulting merely from such errors in drawing as might be expected. We may therefore assign a part of the difference to error in Hooke's picture, and the rest to error in Huygens's. After a critical examination of the two pictures for this purpose, the present writer finds that the most probable value of the rotation period is 24h. 37m. 22'715s., the true value almost certainly lying between 24h. 37m. 22'7s. and 24h. 37m. 22'73s. This is the only case in which the rotation of a planet has been determined, or probably can be determined, with so great an approach to exactness. The marks on Mercury and Venus are too uncertain to be trusted, and the planets Jupiter and Saturn do not in all probability show their real surface to us. The determination of a planet's rotation period is not a mere matter of curiosity; for when for the period has been determined with considerable accuracy, a planet may be regarded thenceforth as a sort of celestial chronometer, by which changes in the rate of other motions may be inferred if not gauged.—The surface of Mars has been carefully studied by many skilful observers. Hooke, Cassini, Huygens, and Fontana were the first to recognize any of those markings which are now known to belong to the real surface. They noted that the polar parts of the planet appeared to be occupied by white matter; but the idea does not seem to have penetrated itself that this matter might be like the snow and ice which are found in the polar regions of our earth. On the contrary, when Maraldi in 1720 studied these white regions, and found that one of them had diminished in size, he predicted its entire disappearance. It was not until Herschel had carefully examined them for a considerable time, and found their variations to correspond to the progress of summer and winter in the northern and southern hemispheres of the planet, that the resemblance between the white spots and our arctic and antarctic snows was recognized, and that Herschel, ever on the watch for analogies of the kind, expressed the opinion that these spots are the snows of Mars. The other parts of the planet present two chief colors, a faint ruddy tint, apparently representing the continents of the planet, and a still fainter indigo-green tint, which from an early period has been regarded as indicating the presence of seas and oceans upon that distant world. It was for a long time impossible, however, as Dr. Whewell pointed out, to be certain that this interpretation of the white spots and of the greenish markings was correct, or that water existed in any form on the surface of Mars. But recently the spectroscopic analysis of the light of Mars has shown beyond question that at times the vapor of water exists in the planet's atmosphere, since the same bands are seen which appear in the solar spectrum when the sun is low down and shining through the denser and more moisture-laden parts of our atmosphere. Nevertheless, it is not easy to understand how the condition of Mars as to temperature can so nearly resemble the earth's, as we should have to believe if we considered only the relative extent of the snowy polar regions in the two planets. Mars is so much further from the sun that the solar radiation is reduced, as compared to that to which our earth is exposed, by about 2 when Mars is in perihelion, and of about 1 to 2 when he is in aphelion. Moreover, being a much smaller planet, we should expect his atmospheric envelope to be much less dense, since if reduced as his volume it would be reduced as the cube of his linear dimensions; whereas it would extend over a surface reduced only as the square of those dimensions. On this assumption there would be less air per square mile of the planet in the proportion of about 11 to 20; and as gravity at the surface of Mars is less than gravity on the earth in the ratio 387 to 1,000, the atmospheric pressure would be less as about 4,257 to 20,000, or would be little more than one fifth that of the earth's sea level. Of course, we have no certain assurance that the assumption here made is even approximately correct. But since, to make the climate of Mars as warm as our earth's, the atmosphere should be much denser than ours, whereas the assumption which must be regarded as the most probable would make the atmospheric density barely one fifth of ours, it seems difficult to regard the climate of Mars as probably like that of our earth. There are reasons, therefore, for viewing as at least worthy of
MARS

consideration the theory of Mattieu Williams, that the climate of Mars is really unlike that of our earth, notwithstanding the similarity of the snow regions in extent. Without entering into the details of his theory, or accepting the relations which he somewhat speculatively exhibits, we may thus far provisionally adopt his views as not improbable.—Owing to the much smaller amount of solar radiation at the distance of Mars, and also to the much more limited extent of its oceans, the quantity of aqueous vapor raised into his atmosphere must be very much less in proportion to the extent of his surface; and it is not unlikely that most of the precipitation of such vapor takes place in the form of snow, which would not fall thickly, and would be soon melted during the Martian day in the tropical and subtropical regions. Thus we may explain the appearances which have hitherto been regarded as due to the dissipation of Martian rain clouds, and also the observed fact that the disk of Mars is whitish near the edge, and the markings invisible there. Thus whatever aqueous vapor, or cloud, was carried to the temperate regions, and whatever ice or snow accumulated in the polar regions, would be much smaller in amount than we should otherwise have inferred from the apparent extent of the polar snow caps, and these would therefore diminish in extent as summer advanced, much more quickly than they would if formed as in the earth's case. The general conclusion to which we should be led if we adopted this view would be that the planet presents conditions unfavorable for the existence of such forms of life as we are familiar with. These questions derive their chief scientific interest, however, as suggesting the careful study of those Martian phenomena which presumably depend on the density of the planet's atmosphere, and its general conditions as respects humidity and so on.

MARS, Anne Francaise, Hippolyte Bouet, a French actress, born in Paris, Feb. 9, 1779, died March 20, 1847. She was the natural daughter of Jacques Monvel, one of the first actors of the day, and a provincial actress named Mars-Boutet, and made her appearance upon the stage in her childhood. At 14 years of age she filled what the French call rôles d'ingénues, and when somewhat older attempted with success jeunes amoureuses; but she made no decided impression upon the public until her personation in 1803 of a deaf and dumb girl in the Abbe de l'Epee. The grace and feeling which she evinced on this occasion created an enthusiasm in her favor, and soon after the retirement of Mlle. Contat in 1809, she assumed the position of the first comic actress of the day. For the last 30 years of her professional life she was without a rival on the French stage in genteel comedy, every new part attempted by her being a success down to that of Mlle. de Belle-Isle in Dumais's drama of that name, produced in 1839, in which, although 80 years of age, she appeared like a young wo-

MAN of 20. She took her leave of the stage in March, 1841. Although some of her greatest triumphs were achieved in the plays of Victor Hugo, Dumas, and other modern writers, she greatly preferred the dramas of the old school, especially the comedies of Molière and the pièces d'intrigue of Marivaux. Her personations of the fashionable lady or coquette of the old régime in these works are among the most cherished traditions of the French stage. Her figure, voice, action, and toilette were alike admirable, and in the expression of her countenance she invariably conformed to the spirit of the scene. She amassed a considerable fortune, and the latter years of her life were passed in a sumptuous retreat, where she daily received visits from persons eminent in literature or the arts. She left an estate valued at 800,000 francs to a son 50 years old at her death, whom during the greater part of her life she had persistently refused to see.

MARSALA (anc. Lilybaenum), a fortified seaport town at the W. extremity of Sicily, adjacent to Cape Boeo (anc. Promontorium Lilybaenum), in the province and 16 m. S. W. of the town of Trapani; pop. about 18,000. It contains a cathedral, several churches, and various monastic, educational, and charitable establishments. It exports corn, cattle, oil, salt, and soda, but chiefly wine.—The ancient city of Lilybaenum, of which Marsala occupies only the southern half, was founded by a colony of Carthaginians who escaped from the destruction of Motya by the elder Dionysius in 397 B. C. It soon prospered, and became the chief bulwark of the Carthaginian power in Sicily. In 276 Pyrrhus of Epirus made an unsuccessful attempt to capture it; and in 260 it was attacked by the Romans in the first Punic war with two consular armies and a formidable fleet. After several efforts to carry it by assault, the consuls converted the siege into a blockade, which was maintained for nearly ten years without accomplishing its object; nor did the Romans obtain possession of it until it was surrendered by the Carthaginians at the conclusion of the war, in part purchase of peace. From this period the harbor of Lilybaenum became a principal station of the Roman fleet, and the city one of the great points of communication between Rome and Africa. The place continued prosperous till the 16th century; but from the period when the emperor Charles V. caused its harbor to be blocked up with a mound in order to protect it from the attacks of the Barbary corsairs, it ceased to hold the first rank among the maritime towns of W. Sicily, and gave place to Trapani. Few vestiges of the ancient city now remain. Numerous fragments of sculpture, however, vases, coins, &c., have been from time to time discovered, and some portions of an aqueduct are still standing. Marsala was Garibaldi's landing place in his expedition to Sicily in May, 1860, where he disembarked in presence of two Neapolitan war steamers.
MARSCHNER, Heinrich, a German composer, born in Zittau, Apr. 16, 1795, died in Hanover, Dec. 13, 1851. He was almost a self-taught musician, his parents being too poor to afford him proper instruction. He acquired a little knowledge of the art here and there; and with this set about composing in every form. Having composed a ballet for a troop of dancers, the orchestra was brought to a sudden stop, the horns having notes to play that were not on their instruments. In 1816 he wrote a little opera, Der Kyffhäuserberg, and in 1819 he produced at Dresden Heinrich IV., and AufbIanide, an opera in three acts. In 1825 he became, jointly with Morlacchi and Von Weber, musical director of the opera in Dresden. In 1828 Der Vampyr, his most celebrated work, was produced at Leipzig. In 1830 he was called to Hanover as chapelmaster to the king, and there he composed two other successful works, Das Schloss am Actna und Hans Helling. He also composed many songs for single voices, ten collections of male-voice part songs, trios, and quartets for instruments, and a variety of sonatas, fantasias, and rondos.

MARSSEN, William, a British orientalist, born in Dublin, Nov. 16, 1754, died near London, Oct. 6, 1836. In 1771 his father, who was a merchant of Dublin, procured for him an appointment in the civil service of the East India company at Bencoolen, Sumatra. He there attained the office of principal secretary to the government, acquired a close acquaintance with the country and the Malay language, and in 1779 returned to England. In 1785 he was made chief secretary to the admiralty, with a salary of £4,000; and on his resignation in 1807, the government conferred on him a pension of £1,500. In 1834 he bequested his rich collection of coins and medals to the British museum, and his valuable library of oriental books and manuscripts to King's college, London. The most important of his works are: "History of Sumatra" (London, 1789); "Grammar and Dictionary of the Malay Language" (1812); a translation of the travels of Marco Polo (1817); and Numisma Orientalia, a treatise on eastern coins, &c. (1823—5).

Marseilles, a national song of France, produced in 1792 by Rouget de l'Isle, an officer then stationed at Strasbourg, and hence originally called Chant de guerre de l'Armée du Rhin. It soon attained popularity throughout the country, and greatly contributed to the victories of the French revolutionary armies. In Paris it was sung for the first time by the band of men who were brought from Marseilles by Barbaroux to aid in the revolution of Aug. 10, 1792. Hence it was called Le chant des Marseillais, and afterward La Marseillaise. It has since continued to be the favorite song during all popular movements in France. The researches of musical scholars within the last quarter of a century, both in France and Germany, seem to prove beyond reasonable doubt that the melody was not composed by Rouget de l'Isle, but was copied by him from the credo of the fourth mass of Holtzmann of Mursberg, who composed it in 1776; and it was first heard in Strasbourg in the hotel of Mme. de Montesson, in 1782.

Marseilles, or Massilia, a city and the principal seaport of France, capital of the department of Bouches-du-Rhône, on the N. E. shore of the gulf of Lyons, at the head of a bay the entrance to which is sheltered by a group of islets, in lat. 43° 18' N., lon. 5° 22' E., 400 m. S. S. E. of Paris; 15 m. from Marseillan, 213,804. It is connected by railway with the principal cities of France, by steamers with the chief ports of the Mediterranean, the Levant, and Algeria, and is the centre of the Indian overland mail service. On its N. side lies the old town, with filthy and tortuous streets and lanes, but containing some spacious squares, a remarkable town hall, and the remains of Roman ramparts. It is separated from the new town by a magnificent avenue, which is successively called Rue d'Aix, in its central part Rue du Grand Cours, and afterward Rue de Rome, and which extends in a straight line from the gate of Aix to that of Rome, traversing the entire length of the city from N. to S., and leading to the Prado, the most popular promenade on the seaside. The handsomest of the many fine streets of the new city is the Cannebière, which leads from the Grand Cours to the old harbor, and contains the most elegant shops, hotels, and coffee houses, including the beautiful Café Ture, chiefly frequented by Greeks and Levantines. The new city is built around the port. The quays are the most bustling and interesting parts of Marseilles, being constantly thronged by crowds of orientals, Greeks, Italians, English, and Frenchmen, who are engaged in the business of the place. The animation of the city is only equalled by the picturesque of its locality. It rises over its port in the form of a gradually sloping amphitheatre; the surrounding hills are covered with olive gardens and vineyards, and with thousands of country houses or bastides of the citizens. Opposite the mouth of the harbor is the château d'If, in which Mirabeau was imprisoned. On summer evenings the inhabitants seek relief from the heat on the seaside, which is crowded with pleasure boats; and many fine residences and places of public entertainment are situated on the banks of the city. All parts of the city are well supplied with water through a canal fed by the Durance, and opened in 1850, at a cost of $1,000,000. The public buildings possess little architectural interest. The cathedral is said to have been built upon the site of a temple of Diana; the church of St. Victor is the most ancient church, and was formerly one of the most celebrated abbeys in Christendom. There is a French Protestant church, a place of worship for the English residents, a Greek church, and a synagogue.—Among the public institutions are an arsenal, a mint, a lyceum, a med-
MARSEILLES

ional school, a hydrographic institution, a school for instruction in Arabic, an industrial and commercial academy, a fine observatory, a museum of pictures, antiquities, medals, and natural history, a library of about 75,000 volumes, a botanic garden, an academy of sciences, letters, and art, medical, agricultural, and statistical societies, and a number of newspapers. The Grand theatre resembles the Odéon of Paris. Besides the Hôtel-Dieu, there are a lunatic asylum, a lying-in hospital, several public institutions for the relief of the poor, a school for deaf mutes, and other public and private charitable establishments. The lazaretto, which was so large that it could hold the entire French army on its return from Egypt, was pulled down in 1850 and removed, as well as the sanitary department, to the quarantine roadstead of Frioul, which was formed by connecting the fortified islets of If, Pomégue, and Ralette by means of a breakwater.—The old harbor is an oblong basin 1,000 yards long by 330 broad, occupying an area of about 70 acres, has a depth of water varying from 18 to 24 ft., and can accommodate 1,500 merchant vessels. It is protected on the right by Fort St. Nicolas, and on the left by Fort St. Jean. N. of it is the new harbor, La Jolliette, which was completed in 1853. It is formed by a breakwater 1,300 yards long, thrown into the sea parallel to the shore, and at a distance of 1,800 ft. from it; two piers stretch toward it from the shore, at a distance of 600 yards from each other, so as to leave room for the entrance of vessels. It forms an inner basin and two outer harbors, and the former is connected with the old port by a canal, which runs behind the fort of St. Jean. The inner basin and this canal cover an area of about 70 acres. Other basins of still greater extent have been constructed since, so that at present they embrace a water area of about 200 acres. The imports in 1871, inclusive of gold and silver, were valued at 964,000,000 francs, the exports at 732,000,000 francs. The imports of grain and flour amounted to 8,500,000 quintals, valued at 151,000,000 francs. Marseilles trades with all parts of the world, but chiefly with the Levant, Algeria, and other coasts of the Mediterranean. The number of French vessels entering the port in 1871 was 5,129, tonnage 1,809,000; French vessels clear-
ed, 3,556, tonnage 878,000; foreign vessels entered, 3,715, tonnage 908,000. The manufactures consist principally of soap, morocco and other leather, glass, porcelain, caps, straw hats, refined sugar, salt, liqueurs, &c.—The ancient city was founded about 600 B. C. by Ionian colonists from Phocea in Asia Minor. (See PHOCEA.) The prosperity and the commerce of the new settlement made rapid progress. Massilia became the rival of Carthage and the ally of Rome. Many new settlements were founded by her along the coast of the Mediterranean, and remained under her subjection, and her navigators advanced as far as the Baltic (about 680). (See PYTHIAS.) Threatened by hostile tribes, the inhabitants of Massilia called the Romans to their assistance (153-

The Bourse, in the Cannebière.

125). The city was left in possession of its independence after the subjugation of Gaul, but in 49, having declared for Pompey at the outbreak of the civil war, it was seized by Caesar and annexed to the Roman republic. Massilia became then celebrated as a seat of learning, and was called the new Athens. Christianity was introduced there in the 3d century. After various vicissitudes the city came in the latter part of the 9th century under the sway of Bosso, king of Cisjurane Burgundy, and in the 13th under that of the counts of Provence; and in 1481 Marseilles with Provence was united to the crown of France. In 1524 it resisted the constable de Bourbon. The religious wars were carried on with great bitterness in Marseilles, and the city submitted to Henry
IV, only in 1596. It was deprived of its franchise by Louis XIV. in 1660. In 1720–21 it was desolated by the plague, which destroyed 40,000 or 50,000 persons, on which occasion Bishop Belzunce distinguished himself by his zeal for the sick; a monument perpetuates his memory, and the poet Pope has celebrated his heroism. During the French revolution, the city declared itself in favor of the Girondists, but it was taken by the terrorists. Schlosser says: "Fréron erected a revolutionary tribunal without a jury in Marseilles, and selected the refuse of humanity for his judges. It almost appeared as if the commissioners of the convention would annihilate the city itself and even the harbor. Executions were of daily occurrence, and the destruction of buildings continued for months, while Fréron dated his reports to the convention, according to the savage style of his time, not from Marseilles, but from 'commune unnamed.' It was only after the restoration of the Bourbons that Marseilles fully recovered from these calamities. The colonization of Algeria gave a powerful impetus to its commerce. During the war of 1870–71 it was repeatedly the scene of violent popular commotions, and an imitation of the Paris commune movement took place in March, 1871. The government troops re-occupied the city, after a struggle, on April 4.

MARSH, Dexter, an American paleontologist, born in 1806, died in Greenfield, Mass., April 2, 1855. Without education, and by occupation a day laborer, his attention was first attracted to the subject of fossils by observing in 1835 the footprints in slabs designed for flagging stones. He was early engaged in the search for specimens, sometimes in the employ of others, but in later years chiefly on his own account, traversing the valley of the Connecticut from the northern line of Massachusetts to Wethersfield, and visiting also the states of New Jersey and New Hampshire. At the time of his death, notwithstanding his frequent supplies to others, his cabinet contained, as the result of his own personal exertions, perhaps the choicest collection of fossil footprints and fishes then in existence. One slab, 10 ft. in length by 6 in width, contained at least 70 distinct footprints; and another, 7 ft. by 4, was literally covered with perfect impressions. There were in all about 500 slabs with tracks and raindrops impressed upon them, and 200 specimens of fossil fishes. After his death the whole collection was sold for about $2,700. (See Fossil Footprints.)

MARSH, I. George Perkins, an American scholar, born in Woodstock, Vt., March 17, 1801. He graduated at Dartmouth college in 1820, and then removed to Burlington, Vt., where he studied law and was admitted to the bar. In 1835 he was elected a member of the supreme executive council of Vermont, and in 1842 became a representative in congress, retaining his seat in that body by successive re-elections till 1849, when he was commissioned by President Taylor as minister resident at Constantinople, which office he held for four years. In 1852 he was sent on a special mission to Greece. During his residence abroad he travelled extensively in the East and in Europe, passing some time in Denmark, Sweden, and Norway, where he has long been recognized as a leading Scandinavian scholar. On his return from Europe in 1853 he was appointed one of the commissioners to rebuild the state house at Montpelier, which was burned in January, 1857, and served as railroad commissioner for Vermont for two years (1857–59). In 1857 he was elected governor of Vermont to make a report to the legislature in regard to the artificial propagation of fishes. In 1860 he received the degree of LL. D. from Dartmouth college. In 1861 he was appointed minister to Italy, a post which he still holds (1875). Besides numerous addresses and speeches, and contributions to periodicals, he has published a "Compendious Grammar of the Old Northern or Icelandic Language, compiled and translated from the Grammar of Rask" (Burlington, 1888); "The Camel, his Organization, Habits, and Uses, considered with reference to his Introduction into the United States" (Boston, 1856); "Lectures on the English Language" (New York, 1861; originally delivered in 1859 in the post-graduate course of Columbia college, New York), in which he "aimed to excite a more general interest among educated men and women in the history and essential character
of their native tongue, and to recommend the study of the English language in its earlier literary monuments rather than through the medium of grammars and linguistic treatises;" "Origin and History of the English Language" (New York, 1862); and "Man and Nature" (New York, 1864). This, with numerous corrections by the author, was translated into Italian (Florence, 1870), and afterward almost entirely rewritten and republished under the title, "The Earth, as modified by Human Action" (New York, 1874). II. Caroline (Crane), wife of the preceding, born in Berkley, Mass., Dec. 1, 1816. She was married in 1888. Her published productions are: "The Hallig, or the Sheepfold in the Waters," translated from the German of Biernatzki, with a biographical sketch of the author (Boston, 1857); and "Wolfe of the Knoll and other Poems" (New York, 1860).

MARSH, Herbert, an English author, born in London in 1757, died in Peterborough in 1839. He was educated at St. John's college, Cambridge. In 1789 he went to Germany, and resided in Göttingen, where he published a moral and German a series of pamphlets in defence of the war policy of Great Britain, for which Mr. Pitt rewarded him with a pension. On the French invasion of Germany he returned to England, and in 1807 was appointed Lady Margaret's professor of divinity at Cambridge, and substituted English for Latin in the delivery of his lectures. In 1816 he was made bishop of Llandaff, and three years subsequently was translated to Peterborough. He was a distinguished opponent of both Calvinists and Roman Catholics. His principal works are: a translation of Michaelis's "Introduction to the New Testament" (London, 1792-1801); "The Authenticity of the Five Books of Moses considered" (4to, Cambridge, 1792); "The National Religion the Foundation of National Education" (1811); "Lectures on the Criticism and Interpretation of the Bible" (1838); and "Lectures on the Authenticity and Credibility of the New Testament, and on the Authority of the Old Testament" (new ed., 1840).

MARSH, James, an American scholar, born in Hartford, Vt., July 19, 1794, died in Colchester, Vt., July 3, 1842. His early life was passed on his father's farm. He graduated at Dartmouth college in 1817, and at Andover theological seminary in 1822. Soon after he became a tutor in Hampden Sidney college, Virginia. In 1824 he was appointed professor of modern languages there, and ordained to the ministry. He was called in 1826 to the presidency of the university of Vermont, which office he resigned in 1833, in order to devote all his time to the duties of a chair of moral and intellectual philosophy, which he occupied until his decease. In 1829 he published an edition of Coleridge's "Aids to Reflection," with notes and a preliminary essay, and a series of papers on popular education; and in 1830 a volume of "Selections from Old English Writ-
In the middle ages he was the chief officer of arms, and at tournaments regulated combats in the lists; but ultimately the title was borne by both civil and military officers. In England, until 1849, the marshal of the king's household presided over the knight marshal's court created by Charles I., which had jurisdiction of personal actions within a circuit of 12 miles around Whitehall. The marshal of the king's bench has the custody of the Marshalsca or king's bench prison in Southwark. The earl marshal is an officer of state, who directs important ceremonies, takes cognizance of matters relating to pedigree and rank, and proclaims the declaration of war or of peace. In the United States, a marshal is an officer of one of the federal judicial districts, having duties similar to those of a sheriff. In ancient Poland the president of the diet was called marshal.—The rank of field marshal (called in German Feldmarschall, in French maréchale de France) is the highest military dignity in several countries of Europe. The title appears to have been introduced into France in the time of Philip Augustus, about 1206. It was introduced into England in 1776 by George III., who created the duke of Argyll field marshal. The English field marshal, when unemployed, has the same daily pay as any other general; but when actually commanding he receives £16 8s. 6d. a day for staff duty, while a general receives £9 9s. 6d. In 1874 there were in Great Britain three field marshals, the duke of Cambridge (created in 1862), Sir W. M. Gomm (1868), and Sir George Pollock (1870). In Austria there were two field marshals, the archduke Albert and Prince Edmond von Schwarzenberg, and in Germany eight, of whom the prince of Saxony and Generals Moltke, Bittenfeld, and Steinmetz were appointed in 1871.

**MARSHALL**, the name of nine counties in the United States. I. A N. county of West Virginia, forming the base of the "Panhandle" between Ohio and Pennsylvania, and bordered on the W. by the Ohio river; area, 230 sq. m.; pop. in 1870, 14,941, of whom 120 were colored. It has a hilly surface and fertile soil. The Baltimore and Ohio railroad passes through it. The chief productions in 1870 were 131, 638 bushels of wheat, 364,743 of Indian corn, 211,052 of oats, 54,781 of potatoes, 119,579 lbs. of wool, 204,480 of butter, and 5,750 tons of hay. There were 3,109 horses, 3,076 milk cows, 3,881 other cattle, 37,508 sheep, and 10,985 swine. Capital, Moundsville. II. A N.E. county of Alabama, intersected by the Tennessee river, and drained by its branches and the head waters of the Black Warrior; area, about 490 sq. m.; pop. in 1870, 9,671, of whom 1,367 were colored. The surface is mountainous, being traversed by ridges of the Appalachian system, and the soil is generally fertile. The chief productions in 1870 were 17, 228 bushels of wheat, 187,491 of Indian corn, 87,116 of sweet potatoes, 5,477 lbs. of tobacco, 47,995 of butter, and 2,340 bales of cotton. There were 1,669 horses, 2,614 milk cows, 1,215 working oxen, 3,366 other cattle, 5,843 sheep, and 12,597 swine. Capital, Warren ton. III. A N. county of Mississippi, bordering on Tennessee, drained by the Tallahatchie, Tippah, and Coldwater rivers; area, 750 sq. m.; pop. in 1870, 29,416, of whom 16,499 were colored. It has an undulating surface and fertile soil. The Mississippi Central railroad intersects it. The chief productions in 1870 were 19,121 bushels of wheat, 775,456 of Indian corn, 29,111 of sweet potatoes, 81,315 lbs. of butter, and 18,379 bales of cotton. There were 2,800 horses, 4,058 mules and asses, 5,885 milk cows, 8,991 other cattle, 4,719 sheep, and 37,157 swine. Capital, Holly Springs. IV. A central county of Tennessee, intersected by Duck river; area, about 850 sq. m.; pop. in 1870, 16,207, of whom 4,858 were colored. It has a diversified surface and a generally fertile soil. The chief productions in 1870 were 126, 633 bushels of wheat, 591,358 of Indian corn, 63,691 of oats, 16,192 of Irish and 16,556 of sweet potatoes. 12,728 lbs. of wool, 751,058 of butter, and 2,068 bales of cotton. There were 6,202 horses, 2,598 mules and asses, 3,881 milk cows, 5,274 other cattle, 16,218 sheep, and 32,038 swine. Capital, Lewisburg. V. A W. county of Kentucky, bounded N. and E. by the Tennessee river and intersected by Clarke's river; area, about 350 sq. m.; pop. in 1870, 9,455, of whom 385 were colored. It has an undulating surface and fertile soil. The Elizabeth and Paducah railroad passes through it. The chief productions in 1870 were 40,708 bushels of wheat, 478,241 of Indian corn, 38,346 of oats, 16,901 of Irish and 19,801 of sweet potatoes, 3,927 lbs. of tobacco, 16,786 of wool, 128,881 of butter, and 90 bales of cotton. There were 1,331 horses, 1,019 mules and asses, 2,187 milk cows, 2,716 other cattle, 10,552 sheep, and 23,927 swine. Capital, Benton. VI. A N. county of Indiana, drained by the Yellow and Tippecanoe rivers; area, 440 sq. m.; pop. in 1870, 20,311. It has a level surface and fertile soil. Iron ore abounds. The Pittsburgh, Fort Wayne, and Chicago, and the Indianapolis, Peru, and Chicago railroads intersect it. The chief productions in 1870 were 319,798 bushels of wheat, 193,080 of Indian corn, 50,359 of oats, 94,994 of potatoes, 39,526 lbs. of wool, 243,853 of butter, and 13,689 tons of hay. There were 5,166 horses, 4,987 milk cows, 5,493 other cattle, 15,216 sheep, and 14,416 swine; 5 manufactories of hubs and wagon material, 2 of carriages, 2 of wooden goods, 1 brewery, 7 flour mills, 3 planing mills, and 42 saw mills. Capital, Plymouth. VII. A N. central county of Illinois, intersected by the Illinois river; area, 446 sq. m.; pop. in 1870, 16,956. It has an almost level surface and a fertile soil. The Peoria branch of the Chicago, Rock Island, and Pacific railroad intersects it, and the Illinois Central skirts the E. border. The chief
productions in 1870 were 107,029 bushels of wheat, 38,135 of rye, 1,122,903 of Indian corn, 392,644 of oats, 98,291 of potatoes, 20,519 lbs. of wool, 290,077 of butter, and 21,445 tons of hay. There were 9,798 horses, 5,533 milch cows, 6,904 other cattle, 5,517 sheep, and 20,098 swine; 2 manufactories of agricultural implements, 13 of carriages, 4 of cooperage, 11 of saddlery and harness, 9 of tin, copper, and sheet-iron ware, 1 of woollen goods, 1 pork-packing establishment, 2 distilleries, and 4 flour mills. Capital, Lacon.

VIII. A central county of Iowa, intersected by Iowa river; area, 576 sq. m.; pop. in 1870, 17,576. The surface is undulating and the soil fertile. It is intersected by the Chicago and North-western and the Central railroad of Iowa. The chief productions in 1870 were 922,560 bushels of wheat, 1,289,631 of Indian corn, 308,671 of oats, 99,851 of potatoes, 20,334 lbs. of wool, 405,972 of butter, and 25,439 tons of hay. There were 7,494 horses, 5,219 milch cows, 7,899 other cattle, 3,525 sheep, and 21,537 swine; 5 manufactories of carriages and wagons, 1 of lime, 2 of machinery, 8 of saddlery and harness, 2 breweries, 4 saw mills, and 6 flour mills. Capital, Marshalltown. IX. A N. E. county of Kansas, bordering on Nebraska, and drained by the Big Blue river; area, 908 sq. m.; pop. in 1870, 6,901. It is intersected by the St. Joseph and Denver City railroad, and by the Central branch of the Union Pacific. The surface is somewhat diversified and the soil fertile. Coal and gypsum abound. The chief productions in 1870 were 160,750 bushels of wheat, 333,605 of Indian corn, 45,476 of oats, 42,485 of potatoes, 125,908 lbs. of butter, and 12,885 tons of hay. There were 2,584 horses, 3,025 milch cows, 4,383 other cattle, 2,379 sheep, and 2,909 swine; 3 flour mills, 2 saw mills, and 4 manufactories of saddlery and harness. Capital, Marysville.

MARSHALL, a city and the county seat of Clay county, on the Mississippi river and the Chicago Central railroad, 40 m. S. W. of Lansing, and 100 m. W. of Detroit; pop. in 1870, 4,925. It is surrounded by a fertile country, and has an important trade in agricultural products. There are several flour mills, saw mills, planing mills, manufactories, and machine shops. Marshall has three national banks, with a capital of $450,000; graded public schools, including a high school; two weekly newspapers, and 10 churches. It was laid out in 1831, and incorporated as a city in 1859.

MARSHALL, Humphrey, an American politician, born in Franklin, Ky., Jan. 18, 1812, died in Louisville, March 28, 1872. He graduated at the military academy, West Point, in 1832, and entered the army as brevet third lieutenant of mounted rangers. After serving in the Black Hawk expedition, he resigned in 1833, and became a lawyer at Frankfort, and afterward at Louisville. He served in the Mexican war in 1846-7, as colonel of the first Kentucky cavalry. In 1849 he was elected to congress, and in 1852 appointed commissioner to China. In 1855 he was again elected to congress. In the civil war he was a major general in the confederate army.

MARSHALL, John, an American jurist, born in Fauquier co., Va., Sept. 24, 1755, died in Philadelphia, July 6, 1835. He was the eldest of 15 children of Col. Thomas Marshall, who signalized himself during the revolution, especially at the battle of Brandywine. The maiden name of his mother was Mary Keith. Col. Marshall was a gentleman of culture, and devoted himself personally to the training of his children. John thus obtained a strong love of English literature, especially for poetry and history. At the age of 12 he knew by heart a large portion of Pope's writings, and was familiar with Milton, Shakespeare, and Dryden. At the age of 14 he was sent to school at Westmoreland, where James Monroe was one of his fellow students. Returning home at the end of a year, he resumed his studies under the direction of a clergyman. His hours were still largely devoted to his favorite poets, and for many years he was full of dreamy romance and poetical enthusiasm. Field sports and athletic exercises in the open air were also habitual with him. He commenced the study of law at the age of 18; but the impending struggle with Great Britain drew him away from his books before he had obtained a license to practise. In 1775 he joined a military company, and when news came of the battle of Lexington, and the march of Patrick Henry upon Williamsburg, he addressed the company in eloquent terms, urging them to prepare for every emergency. After the flight of Dunmore he took part with his regiment, of which his father was major, in the battle of Great Bridge. Marshall was lieutenant of the flanking party which advanced in face of a murderous discharge from the enemy posted on the causeway, and terminated the engagement. His company was the "Culpeper minutemen," who wore green hunting shirts with "Liberty or Death" in white letters on the bosom, and whose banner displayed a coiled rattlesnake, with the motto, "Don't tread on me." In July, 1776, he was made lieutenant in the 11th Virginia regiment, on continental service, and marched to the north. In May, 1777, he was promoted to a captaincy. From the time of his entrance into the army to the close of 1779, Marshall was in active service. He took part in the engagement at Iron Hill, and in the battles of Brandywine, Germantown, and Monmouth. He shared the hardships and sufferings of the troops at Valley Forge with unvarying good humor and sanguine hopefulness. At this period he acted frequently as deputy judge advocate, and escorted the worm to Washington. In the winter of 1779 he was sent to Virginia to take command of a new corps to be raised by the legislature. While this subject was under discussion, he attended a course of law lectures
delivered by Mr. Wythe at William and Mary college, and Bishop Madison's lectures on natural philosophy. In the ensuing summer he was licensed to practise law, but his military duties drew him back to the army. The project to raise additional forces in Virginia seems to have failed, and he set out alone and on foot to make the long journey to headquarters. On his arrival in Philadelphia his appearance was so shabby that the landlord of the hotel at which he stopped refused him admittance. He continued in the army until after the invasion of Virginia by Arnold in 1781, when, finding a redundancy of officers in the Virginia line, he resigned. At the close of the war he began practice as an attorney, and his success was marked from the commencement. The benevolence, placidity, and sweetness of his temper gained him a host of friends; and "that extraordinary comprehension and grasp of mind, by which difficulties were seized and overcome without difficulty or parade, commanded the attention and respect of the courts of justice." In 1782 he was a member of the house of delegates from Fauquier, and in the autumn of the same year was appointed one of the council of state. After his marriage in 1783 with Mary Willis Ambler, daughter of Treasurer Ambler, he resigned his seat in the executive council, and fixed his residence in Richmond. In spite of his removal from the county, his old neighbors reflected him a member of the house, and in 1787 he sat in the same body as representative from the county of Henrico. In June, 1788, the Virginia convention to act upon the constitution drawn up by the Philadelphia convention assembled, and Marshall was a member. He took a conspicuous stand by the side of James Madison, Edmund Pendleton, and other distinguished advocates of its acceptance. His defence of the constitution against its assailants was masterly. On three occasions, the debates on taxation, on the judiciary, and on the power over the militia, he gave full scope to his powerful logic and massive faculty of reasoning. The instrument was finally accepted by a vote of 89 to 79. Marshall and Maillard were justly regarded as having done more for the adoption of the federal plan of government than any other members of the convention. The legislature having in 1788 directed that hereafter the city of Richmond should be entitled to a representative in the house, Marshall was elected, and continued to sit in the assembly during the sessions of 1789, 1790, and 1791. Virginia was the headquarters of the state rights party, whose views were represented in the national cabinet by Thomas Jefferson; and a majority of the people of the commonwealth were opposed to the measures of the administration. The great question whether the United States constitution should be strictly or liberally construed was the point at issue. Marshall supported the federal view with the calmness and moderation of tone which characterized him, but with all the vigor which his friends had expected. When in 1792 he retired from the body, he left not an enemy behind him. From 1792 to 1795 he devoted himself exclusively to his practice, which had greatly increased. In 1793 he appeared prominently in public meetings on the side of the administration of Washington, and defended the proclamation of neutrality occasioned by the insolent conduct of Genest, the French minister. He also advocated Washington's policy with his pen, and secured the passage by a meeting of the citizens of a set of resolutions approving it, which he had drafted. In 1795 he sat again in the house of delegates. In the violent discussions on Jay's treaty, Marshall appeared as its champion; and before an assembly of citizens who had denounced the proposed measure he defended it so powerfully that they reversed their former action, and adopted resolutions in favor of the federal policy. In the legislature he opposed the resolutions condemnatory of the treaty in a speech which is represented to have been one of the greatest and noblest of his performances. The result was that the constitutional question was abandoned, and the assembly confined itself simply to an expression of its disapprobation of the treaty on the ground of its inexpediency at the time. Washington offered Marshall the place of attorney general, which he declined, as interfering with a practice at the bar which had now become very lucrative. In 1796 he was offered the appointment of minister to France, but declined it for the same reason. Gen. Pinckney was appointed in his place, but the French directory refused to receive him; and in 1797 President Adams sent a new commission to Marshall, who yielded his objections, and was succeeded by Gen. Genet, who succeeded as envoy extraordinary to Paris, to negotiate with the directory in relation to the obstructions thrown in the way of the commerce of the United States. These negotiations failed; but the envoys, returning in June, 1798, were received with approval and applause. In New York Marshall was honored with a military escort, and crowds thronged his lodgings, to testify their gratitude and respect. Public addresses were offered him, and a public dinner by members of both houses of congress. Marshall had faithfully reflected the views of the administration and the federal party of the country generally, in his official acts; and he approved of the series of measures directed against France, which were so violently opposed by the republicans. He returned to the practice of the law, but was soon again urged to appear in defence of his party. Washington sent for him to visit him at Mount Vernon, and he finally consented to run for congress, and was elected in 1799 by a small majority. During the canvass, Adams offered him a seat on the bench of the United States supreme court which he declined. In congress he became the mainstay and reliance of the administration, though he seems not to have approved
of the alien and sedition laws, voting for the repeal of the most obnoxious sections of the latter. Virginia had recorded her solemn protest, in the resolutions passed by her assembly in the winter of 1798, against these laws, and had established arsenals and armories to defend her rights by force if necessary. Washington, the great bulwark of the federal party, was no longer at the head of government, and the Republicans were flushed with the daily increasing revulsion against the federal administration. At this crisis Marshall appeared in congress as the federal leader. In the debates upon great constitutional questions he was confessedly the first man in the house. The great event of his career in congress was his speech in defence of the administration in the affair of Jonathan Robbins. This person had committed a murder on board a British frigate, and fled to the United States. On the requisition of the British minister, who alleged that Robbins was a subject of Great Britain, he was surrendered by President Adams, in compliance with a clause in Jay's treaty. For this the opposition in congress unanimously assailed the president. Mr. Livingston introduced a resolution of censure on him for the surrender of Robbins at the dictation of the British minister, and upon this resolution took place an animated debate. The speech which he made on this occasion is the only one that Marshall ever revised, and is that by which he is best known to the world. It demonstrated that the surrender was an act of political power which belonged to the executive. Judge Story says the speech silenced opposition, and settled then and for ever the points of national law upon which the controversy hinged. In May, 1800, Marshall was appointed secretary of war, but before his entry on the duties of the office was offered the place of secretary of state, which he accepted. In this capacity he conducted several important discussions with the British minister, and drew up the instructions to Mr. King, the American minister to London, which hold a prominent place among the great state papers of the country.—On Jan. 31, 1801, he was appointed by President Adams chief justice of the United States supreme court, and the senate unanimously confirmed the appointment. In this great tribunal of ultimate resort his influence is known to have been paramount. In 1804-'7 Judge Marshall published a "Life of Washington" (5 vols.), largely based upon unpublished official documents, in which he defended the course of Washington's administration against the assaults of the republican party. The first volume was published separately in 1824, as "A History of the American Colonies:" and in 1832 the whole work was revised and compressed into two volumes. In 1828 Judge Marshall was a delegate from Richmond to a convention held in Charlottesville for devising a system of internal improvements, to be recommended to the legislature. In 1829 he represented Richmond in the reform convention to revise the old constitution of the commonwealth. For many years he had been suffering greatly from a disease of the bladder. A surgical operation procured him relief, but a hurt received in travelling brought on an attack of liver complaint. He went to Philadelphia for medical assistance, but the disease overpowered him.—In person Marshall was ungraceful, and in dress and bearing presented the appearance of a plain countryman. Mr. Wirt describes him as "tall, meagre, emaciated; his muscles relaxed, and his joints so loosely connected as not only to disqualify him apparently for any vigorous exertion of body, but to destroy everything like harmony in his air or movements." In spite, however, of this ungainliness and simplicity, no one was a greater social favorite. His great passion was the game of quoits; and he was a member of the club which met at Buchanan's Spring, near Richmond, to play at it. He was the centre of a brilliant circle of wits; but he was an unaffected Christian, and in a time of skepticism he never uttered a word to throw doubt upon Chris- tianity.—A selection from his decisions has been published, entitled "The Writings of John Marshall, late Chief Justice of the United States, upon the Federal Constitution" (Boston, 1889).

MARSHALL, Thomas Francis, an American politician, nephew of Chief Justice Marshall, born in Frankfort, Ky., June 7, 1801, died near Versailles, Ky., Sept. 22, 1864. In 1881 he removed to Louisville, where he soon gained an extensive legal practice, was a member of the legislature successively from Jefferson and Woodford counties, and for several years was judge of the Louisville circuit court. From 1841 to 1843 he was a member of congress. In January, 1842, when John Quincy Adams, under protest and in defiance only to the right of petition, presented a memorial of certain citizens of Haverhill, Mass., asking congress to dissolve the Union, Marshall moved a vote of censure, and Mr. Adams's reply subjected him to much ridicule. Though he had entered congress as a whig, he opposed Mr. Clay's United States bank bill, and subsequently favored the annexation of Texas and the election of Polk to the presidency. As a public speaker he was remarkable for his ready repartee and satire, and at different times was involved in four duels, one of them with James Watson Webb, then editor of the New York "Courier and Enquirer." During the latter years of his life he lectured successfully on history and other subjects through the northern and eastern states, and at intervals on temperance, though during the greater part of his life his own habits were intemperate. A collection of his writings and speeches has been edited by W. L. Barre (Svo, Cincinnati, 1858).

MARSHALL, William Calder, a Scottish sculptor, born in Edinburgh in 1813. He studied in London under Chantrey and Baily, visited Rome in 1836, and passed some years in Italy. In 1835 he first exhibited at the royal academy,
and in 1830 took up his residence in London. He was elected an associate of the Scottish academy in 1844, and a royal academician in 1852; and he was employed as one of the three sculptors for the new houses of parliament. In 1857 he obtained the first prize of £700 for a design for a national monument to the duke of Wellington, and he is now (1874) executing in marble part of a series of bass reliefs for the chapel in St. Paul’s cathedral, in which that monument is to be placed. His more important works are: “The Broken Pitcher,” exhibited in 1842; “First Whisper of Love,” 1845; “The Dancing Girl Reposing,” which obtained the art union premium of £500; “Sabrina,” 1847; the statues of Clarendon and Somers for the houses of parliament, of Sir Robert Peel at Manchester, of Jenner in Trafalgar square (1859), of Campbell, of Crompton, the inventor of the mule spinning machine, of James, seventh earl of Derby, at Bolton, and of Sir George Grey in Cape Town, Africa.

MARSH HAWK. See Harrier.

MARSH HEN. See Rail.

MARSH MALLOW. See Althea.

MARSHMAN, Joshua, an English missionary, born at Westbury-Leigh, Wiltshire, in 1767, died in Serampore, India, Dec. 5, 1837. In 1799 he was sent out to Serampore by the Baptist missionary society. He applied himself to the study of Bengalee, Sanskrit, and Chinese, in 1826 visited England, and returned to India in 1829. His principal works are: a Chinese translation of the book of Genesis, the four Gospels, and the Epistles of Paul to the Romans and Corinthians; a “Dissertation on the Characters and Sounds of the Chinese Language” (1809); “The Works of Confucius, containing the Original Text with a Translation” (1811); “Clavis Sinica: Elements of Chinese Grammar,” &c. (Serampore, 1814); and “A Defence of the Deity and Atonement of Jesus Christ” (London, 1822), in reply to a work of Rammohun Roy, discrediting the miracles of Christ. He assisted Dr. Carey in preparing a Sanskrit grammar and a Bengalee and English dictionary, and published an abridgment of the latter in 1827.

MARSH RABBIT. See Hare.

Marsi. I. An ancient people of Italy, of Sabine race. They dwelt in the central Apennines, their territory surrounding Lake Fusignus (now Lago di Celano), where they bordered upon the Sabines and Vestini to the north, the Peligni toward the east, the Samnites and Volscians to the south and southwest, and the Aequi and Hernici to the west. Their principal town was Marruvium or Maruvium (San Benedetto), on the E. bank of the lake. Their origin is ascribed by some legends to Mars, or Phryges, and by others to a son of the sorceress Circe, probably from their acquaintance with the medicinal qualities of some plants growing among the mountains of their territory, which were used as remedies against the bites of snakes. The Marsi en-

joyed a great reputation for bravery among the Romans, against whom they fought in alliance with their neighbors, the Peligni, Marucini, and other Sabellian tribes, in the latter part of the 4th century B.C., finally concluding a peace in 304. Having been for about 200 years the stanch allies of the republic, they became the prime movers of the great war known as the social or Marsic, waged for the right of the Roman franchise, which, though often defeated, they finally secured. It was provoking among the Romans that “no triumph can be obtained over the Marsi or without them.” II. An ancient people of Germany, on the banks of the Ems, probably a tribe of the Cheruci, with whom they fought under Arminius.

MARSIGLIA, Luigi Ferdinando, count, an Italian naturalist, born in Bologna, July 10, 1668, died there, Nov. 1, 1730. He studied mathematics and natural history under Borelli and Malpighi, travelled in Turkey, afterward served in the imperial army, was wounded and captured by the Turks in the battle of Raab (1693), was ransomed by his family, and after the conclusion of peace was employed as a boundary commissioner between Turkey and Austria. In the war of the Spanish succession, being second in command of the garrison at Breisach (1708) when that place surrendered to the French without offering any resistance, he was tried by an Austrian court martial and deprived of his rank in the army. Devoting himself henceforward to scientific pursuits, he travelled in the west of Europe, finally settling in his native city. He published Saggio fisico interno alla storia del mare (1711), De Generazione Fungorum (1717), Danubius Pannonico-Mysicus (1726), and Stato militare dell’impero Ottomano (1729). In England he became a friend of Newton and Halley, and a member of the royal society. He presented his scientific collection to Bologna, and his printing press, with types for Latin, Greek, Hebrew, and Arabic, to the Dominicans of that city.

MARS-LE-TOUR, a village of France, in the department of Menthon-et-Moziol, 13 m. W. of Metz, on the road to Verdun and Paris. It is celebrated for a battle fought here and at Vionville, Aug. 16, 1870, in which Prince Frederick Charles achieved a great strategic victory over Bazaine, who by this defeat was prevented from leaving Metz. The fighting was obstinate, and during a part of the day the Germans were opposed to vastly superior forces. Their losses were estimated at 640 officers and 15,170 men; the French lost 879 officers and 16,128 men. The greater part of the battle field is in the territory ceded to Germany, the new boundary line being in the immediate vicinity of the French village.

MARSTON, John, an English poet, born about 1570, died about 1634. He was educated at Corpus Christi College, Oxford, and entered the Middle Temple, London, where he was chosen lecturer in 1598. He was intimate with

**MARSTON, Westland**, an English author, born in Boston, Lincolnshire, Jan. 30, 1820. He received a legal education in the office of his uncle, a solicitor in London, but relinquished the law for dramatic authorship. Among his best plays are the tragedies of "The Patient's Daughter" (1841), "The Heart and the World" (1847), "Stratford" (1849), "Philip of France" (1849), and "Anne Blake" (1852), several of which possess poetic merits of a high order. He has also produced some comic dramas. His more conspicuous later works are: "Pure Gold," "Donna Diana," "The Favorite of Fortune" (1866), "A Hero of Romance" (1867), and "Life for Life" (1868). He has also published some lyrics in periodicals, a volume of poems (1842), "A Lady in her Own Right," a novel (1860), and a collection of his contributions to periodicals under the title of "Family Credit, and other Tales" (1861).

**MARSTON Moor**, a large open plain of Yorkshire, England, 8 m. N. W. of York, where a decisive victory was gained by the parliamentary forces and the Scots, under Lord Fairfax and the earl of Leven, over the royalists commanded by Prince Rupert, July 2, 1644. The advance of the royalists toward York, which was invested by Fairfax, having compelled the latter to raise the siege, he retired to Marston Moor, where Rupert encountered him on the afternoon of July 2 with 25,000 men. The parliamentary army was of about equal strength. The battle commenced with an ineffectual cannonade on both sides, after which a pause of two hours ensued, each army watching the other across a brook. At 7 o'clock in the evening the signal for close combat was given, and Rupert, who commanded the right wing of the royalists, falling impetuously upon the parliamentary left wing, routed it, and pursued the fugitives several miles. The parliamentary centre was in like manner driven back by the royalist infantry with great loss, and the fortune of the day seemed so desperate that the three parliamentary generals, Lord Fairfax and the earls of Manchester and Leven, fled in different directions. But the imprudence of Rupert ruined his cause. That part of the parliamentary left consisting of Cromwell's brigade of ironsides and David Leslie's Scottish regiments, with some fugitives rallied by Sir Thomas Fairfax, taking advantage of the disordered condition of the cavaliers, who were scattered in pursuit or engaged in plundering the baggage of their enemies, charged them in a compact body with such vigor that after a few brief shots the royal army was driven from the field, and its artillery, consisting of 25 pieces, with more than 100 colors and 1,500 prisoners, captured. The royalist loss in killed and wounded exceeded 2,000, and that of the parliamentary army was nearly as great. A few days afterward York surrendered to Fairfax, and the power of the parliament was permanently established in the north of England.

**MARSTRAND, Wilhelm**, a Danish painter, born in Copenhagen, Dec. 24, 1810, died there, March 25, 1873. He studied at the academies of Copenhagen and Munich and in Rome. His "Return of a Society from a Popular Festival" made him famous as a genre painter; and his reputation was increased by his "Parlor," "Political Gossipper," "Erasmus Montanus," and other pictures after the manner of Holbein. He was a professor at the academy of Copenhagen for more than 20 years, and its director for six years.

**MARSUPIALS**, an order of placental mammals, all, with the exception of the American opossums, now confined to Australia and its archipelago. The name is derived from the presence of a marsupium or abdominal pouch in the females for the protection of their immature young, supported by two supplementary bones attached to the anterior margin of the pelvis. The cerebral characters have been described under MAMMALIA, and the peculiarities of the marsupial lactation under KANGAROO. They have been divided into two sections, according to the character of their food, the phytophagous or plant-eating and the rapacious or carnivorous and insectivorous groups. The former are characterized by the small size or absence of canine teeth, the large incisors (never more than two in the lower jaw), and broad tubercular molars; they include the three families of Phascolomyidae or wombats, Macropodidae or kangaroos, and Phalangistidae or phalangers and koalas. The second group have small and numerous incisors, eight to ten in the upper and six to eight in the lower jaw, canines large and in both jaws, and pointed molars; they include the four families of Peramelidae or bandicoots, Didelphidae or opossums, Myrmecobidae or Australian ant-eaters, and Dasyuridae or dasyures, the last the most carnivorous of all in habits and form. This order presents animals showing types of many of the placental orders; for instance, the phalangers call to mind the quadrumanous, the dasyures the carnivora, the phascolomys the insectivora, and the kangaroos the edentata. Though Australia is the great headquarters of the marsupials, they are found in America from the middle United States to Buenos Ayres, as well as on the W. coast of
South America; those species in Australia nearly allied and with similar habits do not appear to be associated in the same limited district.—The skull in marsupials presents the reptilian character of permanent separation of the bones, even in old animals; the palate is very imperfect, and the angle of the jaw bent inward; the number of teeth is greater than in placental mammals, and that of the incisors is never the same in each jaw; clavicles are present in most of the species; the marsupial bones, existing in both sexes, are considered by Owen as troclear or sesamoid bones, developed in the tendon of the external oblique muscle of the abdomen as the knee-pan is in the tendon of the rectus of the thigh, the cremaster muscle winding around them in the male and the compressors of the mammary gland in the female; in many genera, like the opossums, the tibia and fibula are so loosely connected with each other and with the tarsus that the foot has a movement of rotation upon the leg, the inner toe acting as an opposable thumb. The brain, relatively to the body, is smaller in marsupials than in any other mammals, varying between 1 to 529 and 1 to 800; its structure is more simple, and its surface without convolutions or corpus callosum, and the intelligence corresponds to this inferiority of cerebral development. The organs of smell, hearing, and other senses are well developed; the eyes are generally large and prominent, as most of them are nocturnal in their habits. There are three modifications of the stomach, it being simple in the opossums and phalangers, with a glandular apparatus in the koala and wombat, or sacculated in the kangaroos (in the latter resembling in structure the human colon); these modifications do not appear to be related to the character of the food; in the genera with a simple stomach the cecum is much developed, being sometimes three or four times as long as the animal, while it is very small in those with sacculated complex stomachs, showing the vicarious functions of these two portions of the alimentary canal; in the flesh-eating marsupials the intestine is suspended on a simple and continuous mesentery, as in carnivorous reptiles. The liver is divided into many lobes, and is always provided with a gall bladder; the pancreas and spleen are triangular or T-shaped; in the heart there is not the usual trace of the fetal communication between the auriicles, on account of the early period at which the incompletely developed young begin to respire air. The lungs are constructed on the usual mammalian type, the only tendency to the oviparous structure being the entireness of the rings of the trachea in some of the phalangers; the kidneys present nothing unusual; the membranous portion of the urethra is longer and wider than in other mammals; the vesicula seminale are absent, and the glans sometimes double, with a corresponding duplication in the female organs; in these ovo-viviparous or implacental mammals the vascular layer of the allantois is not developed so as to organize the villi of the chorion or to form cotyledons or a placenta.

For details on the anatomy, mode of development, and natural history of marsupials, the reader is referred to the article "Marsupialia," by Owen, in vol. iii. of the "Cyclopedia of Anatomy and Physiology," and to vol. i. of the "Natural History of Mammalia," by G. R. Waterhouse (London, 1840). Prof. Owen regards the koala as the most typical of the marsupials, having the greatest number of the modifications peculiar to the order, and the smallest number of those common to other groups of mammals. His classification of the order is into: 1, sarcocephala (flesh eaters), like dasyurura; 2, entomophaga (insect eaters), like the opossums; 3, carpophaga (fruit eaters), like the phalangers; 4, poepohega (plant eaters), like the kangaroos; and 5, rhizophaga (root eaters), like the wombat.—The first traces of mammals on the globe are the fossil remains of marsupials in the Stonesfield oolite and the gyspum (eocene) of Paris, though that at those epochs Europe was inhabited by animals of a type now confined to Australia and America; similar fossils have been found in the caverns of Wellington valley, New South Wales, and in the calcareous caverns of Brazil by Dr. Lund, very nearly allied to species now living in those countries.

MARSUS, Donatius, a Roman poet of the Augustan age, of whose life there are no particulars; but he survived Tibullus, who died in 18 B. C. He is frequently mentioned by Martial, who praises his epigrams, which are remarkable for their licentiousness; and he also wrote epic poetry, erotic elegies, and a collection of fables. His fragments are inserted in Weichert's "Poetarum Latinorum Reliquiae" (Leipsic, 1890).

MARSYAS, in Greek mythology, according to different traditions, a satyr or a peasant of Phrygia, son of Hyagnis, Eearus, or Olympus. A flute, which Minerva had thrown away in disgust at seeing the distortion of her features, as she played it, reflected in the water, was picked up by Marsyas. The breath of the goddess, having once filled it, caused it still to emit the most beautiful strains whenever he blew through it. He challenged Apollo to a musical contest, and played the flute while Apollo played the lyre. The latter triumphed only by adding his voice to the music of his instrument. The condition was that the victor should do what he pleased with the vanquished, and Marsyas was bound to a tree and flayed alive. His blood was the source of the river Marsyas in Phrygia, an affluent of the Maeander; and his flute or flutes (for, according to some, he played on the double flute), being borne down this river, were thrown on shore near Sicyon, and there dedicated to Apollo in his temple. The legend is supposed to have reference to the contest between the ethereal and aneclectic styles of music. Marsyas is made by some the inventor of the flute.
Pine Marten (Mustela Americana).

Prey into trees. It is generally taken in winter in dead-falls, set about a quarter of a mile apart and baited with a piece of meat or fish; the winter traveller in the mining region of Lake Superior, in following the Indian trails, sees many of these traps containing the dead and frozen victims. This marten is properly called the American sable, though the mink, of inferior value (of the genus Putorius, Cuv.), is by furriers erroneously called by this name; the fur is sometimes dyed and sold as Russian sable, when of very fine quality. (See Fur.) It has been questioned whether the pine marten of Europe (M. Martes, Linn.) is the same as the American; it is probably a distinct species, and is so regarded by Prof. Baird. The northern limit in America, according to Richardson, is 63° N., where trees cease; the absence of trees, and consequently of the marten, according to Pennant, for 25 degrees of longitude on the Asiatic side of Belring's straits, is in favor of the non-identity of the two species; the same facts would add to the improbability of the true sable (M. Sibellina, Linn.) being found in this country; the southern limit, according to Audubon and Bachman, is about 40°, and its range extends from the Atlantic to the Pacific. The European pine marten is grayish brown, with a yellow spot under the neck. The beech marten (M. Joina, Linn.) has a white spot on the throat, the body more reddish and yellowish brown, the tail brownish black, and the downy fur of all parts of a lighter hue. The sable is described under its proper title. The martens have one more carnivorous tooth than the polecats, and are less sanguinary in their habits, eating when pressed more vegetable food; they are generally wild, inhabitants of woods, climbing trees in pursuit of birds, squirrels, and other small animals; they are all nocturnal, preferring cold and uninhabited regions; all are valuable for their fur, that of the sable being most prized, next that of the pine marten of America, then of the common and beech martens of Europe, and last of the Americanisher.

MARTENS. 1. Georg Friedrich von, a German publicist, born in Hamburg, Feb. 22, 1756, died in Frankfort, Feb. 21, 1821. He studied at Göttingen, where he became in 1784 professor of jurisprudence, was ennobled in 1789, and was employed in various public capacities, serving during the five years previous to his death as Hanoverian minister at the German diet. His reputation rests on his Précis du droit des gens moderne de l'Europe (3d ed., Gottingen, 1821), and his Recueil de traités (7 vols., 1791-1801, and a supplement in 4 vols., 1809-50), the latter of which, with continuations by other writers, includes treaties of 93 years, from 1761 to 1854. He also wrote Cours diplomatique, ou tableau des relations extérieures des guerres de l'Europe (3 vols., Berlin, 1801), and several other kindred works.

II. Karl von, a German diplomatist, nephew of the preceding, born in Frankfort about 1790, died in Dresden, March 28, 1863. In the latter part of his life he represented the grand duke of Saxe-Weimar at the court of Saxony. His principal works are: Guide diplomatique (6th ed., 2 vols., Leipzig, 1806), originally entitled Manuel diplomatique (1821); Causes célèbres du droit des gens (3d ed., 5 vols., 1858-61); and, jointly with Cussy, Recueil manuel et pratique de traités (7 vols., 1846-57).

MARTHA'S VINEYARD, an island lying off the S. coast of Massachusetts, and forming the principal portion of Dukes co. With Chappaquiddick island, which lies immediately adjacent at its E. extremity and may be considered a portion of it, it is divided into four towns, Chilmark, Edgartown, Gay Head, and Tisbury; aggregate population in 1870, 2,085. At Gay Head there is a remnant of the former Indian possessors of the island, now mostly mixed with negro blood. Edgartown is 14 m. S. by E. of Wood's Hole on Cape Cod, 25 m. W. by N. of Nantucket, 30 m. S. E. of New Bedford, and 75 m. S. E. of Boston. Martha's Vineyard, which is separated from the mainland by Vineyard sound, is 21 m. long and 6 m. in
average breadth. The surface is generally level, though there are elevations rising to the height of 150 ft. above the sea. The promontory of Gay Head, at the S. W. extremity, is 134 ft. above high water, and is much visited. On it there is a lighthouse (lat. 41° 20' 55" N., lon. 70° 49' 47" W.), showing a white flashing light, 170 ft. above the sea. The soil is generally light, and a great part of the surface is covered with low forests. The inhabitants are chiefly engaged in navigation and fishing.—Martha's Vineyard was discovered by Bartholomew Gosnold in 1602, though he gave the name, not to the island which now bears it, but to a neighboring islet which is now called No Man's Land. In 1642 Martha's Vineyard was settled by Thomas Mayhew, who had been a merchant at Southampton, England. In 1644 it was placed under the jurisdiction of Massachusetts, and in 1664 it was transferred to New York, but was restored to Massachusetts in 1692. It suffered much during the revolutionary war from the British, who plundered it of 2,000 head of cattle. It has of late years become noted for its annual camp meetings and a summer resort. (See Edgartown.)

**MARTIAL (Marcus Valerius Martialis),** a Latin epigrammatist, born in Bilbilis, Spain, March 1, A. D. 43, died near the same place in or after 104. Little is known of his history except from his works, the younger Pliny being the only contemporary author who mentions him. He went to Rome in 66, resided there 35 years, and then returned to Bilbilis, where he lived at least three years. While in Rome the fame of his epigrams caused them to be sought not only in the capital, but also in Gaul, Germany, and Britain; he enjoyed the patronage and favor of the emperors Titus and Domitian; was raised to the rank of tribune and of knight; and had a mansion in the city, and a villa near Nomentum. His extant works consist of more than 1,500 short poems, in 14 books, bearing the general title of *Epigrammata.* The last two books, consisting of 350 distichs, are named respectively *Xenia* and *Apophoreta.* Still another book, containing 33 epigrams on the public shows, and bearing only in late MSS. the title of *De Spectaculis,* is attributed to him. The term epigram had previously been applied to any brief metrical effusion of whatever character, on whatever subject, and thus to the whole mass of the Greek anthology. Martial was the first to limit its meaning to a short poem, abounding in ingenious and pointed thoughts, all of which converge to a pithy and striking conclusion. He displays a singularly fertile fancy, a pungent wit, and refinement and delicacy of diction. No author has furnished a more full and minute delineation of Roman customs and social habits during the first century of the empire. But he lavishes adulation upon Domitian, and delights in obscenity. Among the best editions are those of Lemaire (3 vols., Paris, 1825) and Schneidewin (Grimma, 1842). Selections from his epigrams have been translated by several English poets, but the only complete version is that by various authors in Bohn's "Classical Library" (London, 1860). There is a German translation by Rumler. Martial, with a French translation, is contained in Nisard's edition of the Latin authors (Paris, 1828); and a translation by several hands, with a memoir by Jules Janin, was edited by Lemaistre and Dubois (2 vols., 1864).

**MARTIAL LAW,** a term often confounded with military law, but in fact quite distinct from it. Military law, besides some customary law, consists chiefly of the articles of war; that is to say, of the code enacted by the supreme legislative authority for the government of the army and navy. It embraces, also, the body of rules and regulations which are prescribed from time to time by competent military authority, for the preservation of the general discipline and order. Military law does not supersede the general municipal law; it is rather a branch of it, more limited in the range of its application than the admiralty or the chancerly law, for example, yet having a like authority with them. In this country, unlike some of the states of continental Europe, the application of military law to the soldier is not exclusive of, but coordinate with, the general civil law. Every soldier, as a citizen, is subject to the common law of the land; but as a soldier he is amenable to the military law. The special tribunals which administer this law are named courts martial, and hence perhaps has arisen in part the confusion of the military law with the law martial. (See Court Martial.) Martial law, says Blackstone, is in fact no law at all. Smith, in his "English Republic," says: "Martial law is the law of war, that depends on the just but arbitrary power and pleasure of the King. For, though he doth not make any laws but by common consent in parliament, yet in time of war, by reason of the necessity of it, to guard against dangers that often arise, he useth absolute power; so that his word is a law." However opposed to other authorities, this expresses what instinctively meant both in England and in this country by martial law. When in time of extreme peril to the state, either from without or from within, the general safety cannot be trusted to the ordinary administration, or the public welfare demands the adoption and execution of extraordinary measures, it may become necessary to declare the existence of martial law. This is, indeed, no law at all in its ordinary sense; it is in fact the abrogation of it. That which is done under martial law has not an immediate constitutional or legislative sanction, as the military or the statute law has. It proceeds directly from the military power, which has now become supreme. The supreme court of the United States has held that a state legislature may proclaim its existence whenever the public safety demands it; and the constitution, by implication at
least, also permits its proclamation by that clause which provides that the privileges of the writ of habeas corpus shall not be suspended, unless when, in cases of rebellion or invasion, it is essential to the general welfare. The right to judge whether the exigency has arisen belongs, it seems, exclusively to congress. So in England martial law and its incident, the suspension of the writ of habeas corpus, require the authority of parliamentary acts to give them a constitutional existence. The supreme court of the United States also held in Milligan's case (4 Wallace, 2), that martial law could not be permitted, even during the existence of a civil war, to displace the ordinary administration of law in a state not invaded and not engaged in rebellion, and where the courts were open and in the proper and unobstructed exercise of their functions; and that the guaranty of jury trial in the constitution would make void all trials and sentences by military tribunals in such states of citizens not in military or naval service. And neither the president, nor congress, nor the judiciary, it was held, could take from the citizen the benefit of such guaranty under the circumstances stated.

MARTIN, an American bird, the largest of the swallow family, belonging to the genus Progne (Boie). The bill is strong and short, with a very wide gape and curved culmen; the wings lengthened, the first quill the longest; the tail moderate, but considerably forked; tarsi shorter than the middle toe and robust; the toes long and strong, the lateral ones equal, with curved claws. The best known is the purple martin (P. purpurea, Boie), generally distributed over North America; the length is 7½ in., the extent of wings 16 in., and the bill along the gape 1 in.; the general color is glossy steel blue, with purple and violet reflections; the female and young are less brilliant, and pale brownish below with darker and bluish

---

blots; the bill brownish black; the closed wings are rather longer than the tail, and the tarsi and toes are naked. Martins appear in Louisiana early in February in large flocks, in the middle states from the middle of March to the 10th of April, in New England about the 25th of April, and further north at a later period, departing for the south again about the 20th of August in immense flocks and all at once at the dawn of some calm morning. The flight is graceful, easy, and swift; they are expert in catching their insect prey, in bathing and drinking while on the wing, and in performing aerial evolutions to the annoyance of their bird enemies; they are very bold, and do not hesitate to attack crows and hawks, which from their superior powers of flight they drive away; even the fierce little king bird (sometimes called field martin), with similar fighting propensities, has to yield to the strong and swift martin; they perch easily upon trees, and, notwithstanding the shortness of their legs, walk well upon the ground. From their attacking cats, dogs, and all flying marauders of the farm yard, they are great favorites, and are provided with elevated boxes for rearing their young in most towns of the United States; these harbingers of spring are much attached to their breeding places, and return to the same year after year; in the absence of a box, they build in any crevice or hole in a tree. The nest is made of leaves, twigs, grasses, feathers, and other soft materials, and generally contains four to six pure white eggs; many pairs breed in the same box in perfect harmony; two broods are generally reared in a season; the males assist in incubation. The food consists of wasps, bees, beetles, and other insects, though they seldom seize the honey bee. In England some of the swallows are called martins; these, as the house martin (chelidon urbica, Boie), and the sand or bank martin (coyte riparia, Boie), are noticed under SWALLOW.

MARTIN. 1. An E. county of North Carolina, bounded N. by the Roanoke river; area, 429 sq. m.; pop. in 1870, 9,647, of whom 4,558 were colored. The surface is level and the soil generally sandy. The chief productions in 1870 were 206,384 bushels of Indian corn, 47,799 of sweet potatoes, and 3,607 bales of cotton. There were 696 horses, 566 mules and asses, 1,232 milch cows, 2,738 other cattle, 2,253 sheep, and 11,680 swine. Capital, Williamston. 2. An E. county of Kentucky, formed since the census of 1870, separated from West Virginia by the Tug fork of Sandy river; area, about 250 sq. m. The surface is mountainous and well timbered. Capital, Warfield. 3. A S.W. county of Indiana, drained by the E. fork of White river and by Lick creek; area, 340 sq. m.; pop. in 1870, 11,108. The surface is hilly and the soil moderately fertile. The Ohio and Mississippi railroad intersects it. The chief productions in 1870 were 102,288 bushels of wheat, 360,680
of Indian corn, 73,394 of oats, 21,588 of potatoes, 50,079 lbs. of tobacco, 39,501 of wool, 120,481 of butter, and 3,341 tons of hay. There were 3,267 horses, 2,357 milch cows, 3,674 other cattle, 17,071 sheep, and 14,976 swine; 2 distilleries, 6 flour mills, and 7 saw mills. Capital, Dover Hill. IV. A S. county of Minnesota, bordering on Iowa, drained by the head waters of Blue Earth river and of the E. fork of the Des Moines, and containing numerous small lakes; area, 720 sq. m.; pop. in 1870, 3,867. It has a rolling surface and a fertile soil. The chief productions in 1870 were 99,565 bushels of wheat, 39,149 of Indian corn, 107,042 of oats, 25,094 of potatoes, 114,473 lbs. of butter, and 11,689 tons of hay. There were 1,114 horses, 3,223 cattle, 749 sheep, and 1,039 swine; 2 flour mills, and 2 saw mills. Capital, Fairmount.

MARTIN, the name of five popes, of whom the following are the more important. I. Martin I. Urban, born at Todi in Tuscany about 900, died in the Lanzo Chersonese (Crimes), Sept. 16, 655. He was elected July 5, 649, and energetically opposed the spread of Monothelitism. He opened the first council of the Lateran, Oct. 5, 649, and had 20 decrees enacted condemnatory of the new heresy, as well as of a doctrinal edict called "Type," published by the reigning emperor Constans II., which forbade all controversy on the subject of one or two wills in Christ. He was consequently, by order of the emperor, held captive on the island of Naxos for 15 months (653-4), and afterward carried to Constantinople, where he was publicly stripped of his clerical robes, led in chains through the city, and confined in a dungeon till March, 655, when he was sent to the Chersonese and left destitute of all means of subsistence. He is honored as a martyr in the Greek and Latin churches, and his feast is celebrated on Nov. 12. There are 18 encyclical letters of this pope in the Bibliotheca Patarum and Labbe's Concilia. II. Martin IV. (Simeon of Batoks), born in Touraine about 1220, died in Perugia, March 26, 1285. By some he is designated as Martin II., but as the generality of writers consider the name Marinus identical with Martinus, the two popes bearing the former name are reckoned as Martin II. (Marinus I., died 881) and Martin III. (Marinus II., died 946). Simon was a regular canon and treasurer of the church of St. Martin at Tours. Louis IX. appointed him chancellor in 1260; in 1262 he was created by Urban IV. cardinal priest of Santa Cecilia; and under Gregory X. he was apostolic legate in France. He was unanimously elected pope at Viterbo, Feb. 22, 1281, after a long and stormy conclave. The two powerful rival families of Orsini and Annibaldeschi bestowed on him the title of senator of Rome, which Martin transferred to Charles of Anjou, king of Naples and Sicily, by whose influence he had been elected, and whom he encouraged to aspire to the throne of Constantinople. The Greek emperor, Michael Paleologus, who had been unable or unwilling to effect a reunion of the eastern with the western church, was excommunicated. Paleologus joined the party of Pedro III. of Aragon, who also, having come with a fleet and army to take possession of Sicily, was excommunicated, and was deprived of the crown of Aragon, which was given by the pope to Charles of Valois, son of the king of France. The crusade was then preached against Pedro in France and Italy. All these measures turned out disastrously for the pope's policy, while his own persecution of the Italian Ghibellines caused wide dissatisfaction and revolts. During a popular rising in Orvieto in 1285, the violence of the governor obliged Martin to take refuge in Perugia, where he died. He was canonized by the people of Perugia, but not by the universal church. III. Martin V. (Ortolone Colonna), born in Rome about 1305, died there, Feb. 20, 1417. He graduated in arts at the university of Perugia, and was sent by the pope to the papal courts in Avignon. Innocent VII. created him cardinal and bishop of Rome. Under John XXIII. he was governor of the States of the Church. He was elected pope during the 41st session of the council of Constance (Nov. 11, 1417), and the next day published a bull on the Roman chancery, confirming the rules established by his predecessors, and apparently confirming the abuses complained of. A plan of reformation was submitted by the nations represented in the council. The pope presented a counter plan for debate, and meanwhile negotiated a separate concordat with each of the Transalpine powers. This broke up the council, which was solemnly closed on April 22, 1415. On Feb. 22 he published a bull condemning the Hussite doctrines, and proclaiming, at the prayer of King John I. of Portugal, a crusade against the Moors. On April 12 he issued a constitution forbidding all appeals from the pope to a general council, except in times of open schism. He departed from Constance May 16, and on his arrival in Milan he published a bull forbidding disturbance of Jews under any pretext, so long as they were guilty of no open offence against faith or morality. He remained at Florence from February, 1419, till Sept. 15, 1420, entered Rome Sept. 22, and devoted himself to the restoration of industry and commerce and the pacification of Italy. In January, 1431, he sent Cardinal Cesarini to preside at the opening of the council of Basil; but he was himself stricken with apoplexy before the day appointed for that purpose. He was a great patron of learning; his own palace and those of his cardinals were free schools of science and art for the youth of Italy.
a member of the colonial assembly, and in 1776 was appointed colonel of a regiment of the continental line, with which he fought at Brandywine and Germantown. He was state senator from 1779 to 1782, and in 1785, 1787, and 1788, and was speaker of the senate, and as such acting governor, in 1781-2. In 1782 he was elected governor, and again in 1789, having in the interval been a member of the convention which framed the federal constitution; and from 1793 to 1799 he was United States senator from North Carolina.

MARTIN, I. Arthur, a French archaeologist, born at Auray, Morbihan, in 1801, died in Ravenna in March, 1856. He became a Jesuit, and devoted himself exclusively to archaeology. Besides several other remarkable illustrated works, he published with Père Cahier Vitraux peints de Saint Etienne de Bourges (imp. fol., Paris, 1842-44), and Mélanges d’archéologie (4 vols. 4to, Paris, 1848-56). In 1856, in a competition of European architects, he was chosen to design and construct the proposed cathedral at Lille; and having gone to Ravenna to make some preliminary studies, he died there of pneumonia.

II. Félix, a French ecclesiastic, brother of the preceding, born at Auray, Oct. 4, 1804. He became a Jesuit, and in 1842 went to Canada to revive the mission there. He founded St. Mary’s college, Montreal, over which he presided for many years; his architectural ability was displayed not only in that institution, but also in two adjacent churches. He collected material relating to the history of Canada, and contributed largely to the recent publications on that subject. He was next stationed at Quebec, but his eyesight becoming impaired, he returned to France, and has since been connected with a house of his order near Paris. His chief works are: Manuel du pêlerin de Notre Dame de Bon Secours (Montreal, 1848); Relation des Jésuites, an enlarged translation of O’Callaghan’s bibliography of that series (1850); a French translation with notes of Bressani’s Breve relazione (Montreal, 1892); Mission du Canada, relations inédites (Paris, 1861); De Montcalm en Canada (1867); and Le R. P. Isaac Jogues (1870). He explored the Huron country and prepared a report upon it, and has assisted Carayon in his series of volumes on the Jesuit missions.

MARTIN, Bon Louis Henri, a French historian, born in St. Quentin, Feb. 20, 1810. He was educated at the college of St. Quentin. Wolfthurn, a romance, written in conjunction with Félix Davin, appeared in 1830, and was followed by a series of historical novels illustrating the period of the Fronde. In 1836 he began the publication of Histoire de France par les principaux historiens, a work intended to embrace extracts, chronologically arranged, from the principal chroniclers and historians. One by one the contributors dropped off, until Martin was left to conduct the publication alone. Tiring of this occupation, he determined to substitute an original history, of which the first edition, under the title of Histoire de France, appeared in 1833-6 (15 vols. 8vo). Scarcely was the last volume issued from the press when he commenced a revision of the whole work on a more comprehensive plan, which occupied him 17 years, during which a second edition of the original work was also published. Of the 19 volumes of the second work, which appeared at irregular intervals, the 10th and 11th, devoted to “Religious Wars,” received the first Gobert prize of the academy of inscriptions, and the 14th, 15th, and 16th, relating to the reign of Louis XIV., the second Gobert prize from the French academy, and after the death of Augustin Thierry, the first. After the completion of the second revision Martin published a third and more elaborate one, embracing the most recent discoveries in Celtic antiquities, and in ancient and mediæval history, religion, language, and literature (17 vols., 1855-60), a portion of which was translated into English by Mary L. Booth (“History of France: Age of Louis XIV,” 3 vols., Boston, 1865). In 1857 Martin issued an illustrated edition (4to) of his history. In 1869 the institute awarded it the biennial prize of 20,000 francs. He has also published Daniel Martin (Paris, 1859), L’Unité italienne et la France (1861), Jean Reynaud (1869), Pologne et Moscovie (1863), Vercingétorix, a historical drama (1865), and La Russie d’Europe (1866). In 1848 M. Martin occupied the chair of modern history at the Sorbonne.

MARTIN, David, a French clergyman, born in Bevel, Sept. 7, 1839, died in Utrecht, Holland, Sept. 9, 1721. He was admitted to the ministry in 1668, emigrated to Holland after the revocation of the edict of Nantes, and about 1686 became pastor and professor of theology and philosophy in Utrecht. He was an eminent Biblical scholar, and published Histoire du Vieux et du Nouveau Testament (Amsterdam, 1700), which has been often reprinted, was translated into Dutch, was embellished with 420 fine engravings, and is known as “Mortier’s Bible;” editions of the Bible with notes, and a treatise on revealed religion.

MARTIN, François Xavier, an American jurist, born in Marseilles, France, March 17, 1764, died in New Orleans, Dec. 11, 1846. At the age of 18 he emigrated to Martinique, where he was unsuccessful in business. In 1786 he took up his residence in New Berne, N. C., and taught French. He also learned printing and established a newspaper, which he peddled through the adjoining counties; and subsequently he published school books, almanacs, translations of French works, &c. He was admitted to the bar, but continued to work as a printer, and published brief treatises on the duties of sheriffs, justices of the peace, executors, and administrators. He compiled the British statutes in force in North Carolina at the period of the revolution, with a digest of the statutes of the state, and a translation of “Pothier on Obligations,” which, published in
1802, was rendered directly from the French into English type in the composing stick. He collected materials for a history of North Carolina, which was published chiefly in the form of annals (2 vols. 8vo, New Orleans, 1829). He also prepared a series of reports of the decisions of the higher courts of the state, now the oldest volumes of that character received as authority in the courts of North Carolina. After 20 years’ practice in New Orleans he was appointed one of the judges of the territory of Mississippi, which post he filled for a year, when he was transferred to the bench of the territory of Orleans. Here he acquired the title of father of the jurisprudence of Louisiana, by his incessant and well directed labors in reconciling the discordant elements of law introduced by preceding jurisdictions. In February, 1813, soon after the formation of the state of Louisiana, he was appointed its attorney general; and in January, 1815, he was advanced to the bench of the supreme court, of which he remained a justice 32 years. He was partially and for ten years almost entirely blind, but discharged his duties regularly. He published reports of the superior court of Orleans from 1809 to 1813 (2 vols.), and of the supreme court of Louisiana from 1813 to 1830 (18 vols.), besides a digest of the territorial and state laws in French and English (2 vols.), prepared under a resolution of the legislature. He also published a history of Louisiana, from its settlement to the treaty of Ghent in 1814 (2 vols., 1827). He received the degree of LL. D. from Harvard college and Nashville university.

MARTIN, John, an English painter, born at Haydon Bridge, Northumberland, July 19, 1759, died in Douglass, Isle of Man, Feb. 9, 1854. He was apprenticed to a coach maker to learn heraldic painting, and subsequently to an Italian artist named Musso, whom he accompanied in 1806 to London. He supported himself for several years by painting on china and glass, and teaching. In 1812 he produced, after a month’s labor, “Sadak in Search of the Waters of Oblivion,” which was exhibited in the royal academy and sold for 50 guineas. It was followed by the “Expulsion from Paradise” (1818), “Clitio” (1814), and “Joshua commanding the Sun to stand still” (1815). The last received the prize of the year at the British institution. In the following years he produced the “Fall of Babylon” (1819), “Macbeth” (1820), “Belshazzar’s Feast” (1821), which obtained the premium of £200 from the British institution, “The Destruction of Herculaneum” (1829), “The Seventh Plague” (1829), “The Creation” (1824), “The Deluge” (1826), and “The Fall of Nineveh” (1829). Mezzotint engravings of these works, executed by the artist and disseminated by many thousands, added to their reputation, and have still a considerable degree of popularity. Martin subsequently for several years devoted himself to designing and engraving a set of illustrations for Milton, for which he received 2,000 guineas, and to projects for improving the city of London. About 1838 he resumed his pencil, and worked industriously until a few weeks before his death. His last productions, three large pictures, intended to be his masterpieces, and entitled “The Last Judgment,” “The Day of Wrath,” and “The Plains of Heaven,” were, though left unfinished, exhibited in the United States in 1856.

MARTIN, Louis Aimé. See Aimé-Martin.

MARTIN, Luther, an American lawyer, born in New Brunswick, N. J., in 1744, died in New York, July 10, 1826. He graduated at the college of New Jersey in 1762, and till 1770 taught school at Queenstown, Md. In 1771 he was admitted to the bar in Accomac county, Va., and soon afterward removed to Baltimore. In 1774 he was a member of the convention at Annapolis to oppose the claims of Great Britain, and he published an “Address to the Inhabitants of the Peninsula between the Delaware River and the Chesapeake,” urging resistance to British usurpation. In 1778 he was appointed attorney general of Maryland; in 1784–5 was a delegate to the continental congress; and in 1797 a member of the convention which framed the federal constitution, the adoption of which he opposed, mainly on the ground that it did not sufficiently recognize the equality of the states by giving to each the same number of representatives. On his return he delivered before the Maryland assembly an elaborate address, afterward published under the title, “Genuine Information delivered to the Legislature of the State of Maryland relative to the Proceedings of the General Convention lately held in Philadelphia” (Philadelphia, 1788). In 1805 he defended Samuel Chase, an associate justice of the United States supreme court, who was impeached by the house of representatives for malfeasance, and was fully acquitted. In 1807 he was engaged with John Wickham, William Wirt, and John Randolph in the successful defense of Aaron Burr. In 1818 he was appointed chief judge of the court of oyer and terminer for Baltimore, and in 1818 he again became attorney general of Maryland and district attorney of Baltimore. In 1820 he was struck with paralysis, and two years afterward, with broken health and ruined fortune, he removed to New York to find refuge with Aaron Burr. He was a violent politician, and published essays against Jefferson and his party.

MARTIN, Saint, bishop of Tours, born at Sabaria in Pannonia about 316, died at Cande in Touraine about 400. He was educated for the military profession, and entered the army of Constantine the Great at 15. At 18 he was sent into Gaul and stationed at Amiens. He left the army in 338, and became the disciple of St. Hilary of Poitiers, who instructed him and ordained him bishop. After living as a monk at Milan and in the little island of Gallinaria near Genoa, he rejoined St. Hilary at Poitiers.
on his return from exile in 380. He built at Ligugé near that city the first monastery, according to some, established in Gaul. In 371 he was elected bishop of Tours, and built the monastery of Marmoutier, in which he chiefly resided, and which became so renowned for learning and piety that the neighboring churches chose their bishops there. The unwearied labors of Martin and his followers caused him to be looked upon as the second apostle of Gaul. He visited the imperial court repeatedly to denounce the tyranny of the provincial officers. In 388 he obtained from the usurper Maximus at Treses the pardon of several bishops and high magistrates sentenced to exile or death as adherents of the emperor Gratian. At the same time both he and St. Ambrose opposed Ithaeus and other Spanish bishops, who urged Maximus to put to death the Manichean Priscillian and his adherents. The Spaniards having succeeded in their purpose after Martin's departure, he renounced all fellowship with them. In 389 the historian Sulpiitus Severus became his disciple, and thenceforward accompanied him in his continual missionary excursions. St. Martin is the first in the Latin church to whom was given the title of "confessor" as distinguished from that of martyr. His feast is celebrated on Nov. 11, hence called "Martinmas" in Great Britain, and distinguished by an equivalent appellation in France and Germany. His life, written by Sulpiitus Severus, was printed in the second volume of Aldus Manutius's Poëta Christiani (Venice, 1501), and reprinted separately at Paris in 1511. See also Dupuy, Histoire de Saint Martin (Paris, 1852); and Montalembert, Les moines d'Occident.

MARTIN, Theodore, a British author, born in Edinburgh in 1816. He practised law for several years in Edinburgh, and in 1846 removed to London, where he became a parliamentary solicitor. He contributed to various periodicals under the signature of "Bon Gaultier," and published "The Book of Ballads, by Bon Gaultier," a series of burlesque pieces and parodies, written in conjunction with Professor W. E. Aytoun, with whom he was associated in a translation of the "Poems and Ballads of Goethe" (1858). He has translated the Correggio and Aladdin of Oehlenschläger; "King René's Daughter," a lyrical drama by the Danish poet Henrik Hertz; "The Odes of Horace," in English verse (1860); "The Poems of Catullus," in English verse, with an introduction and notes (1861); Dante's Vita nuova (1862); and Goethe's Faust (3d ed., 1870). He has also written a biography of W. E. Aytoun (Edinburgh, 1868), and "The Life of the Prince Consort," under the queen's supervision (London, 1875).

MARTINEAU, I. Harriet, an English author, born in Norwich, June 12, 1809. She is descended from French ancestors, who on the revocation of the edict of Nantes established themselves at Norwich. She received a liberal education, and at an early age, being afflicted with a constantly increasing deafness and a total lack of the sense of smell, found her chief recreation in literary composition. Pecuniary disasters soon compelled her to rely upon her pen for support. In 1823 she published "Devotional Exercises for the Use of the Young," and in 1824 a tale entitled "Christmas Day," a sequel to which, "The Friend," appeared in 1825. Encouraged by the success of these works, she produced "Principle and Practice," "The Rioters," and "Original Hymns" (1826); "The Turn-Out" and "Mary Campbell" (1827); "My Servant Rachel," a "Sequel to Principle and Practice" (1828); and a series of "Tracts" on questions relating to the working classes, in whose welfare several of her previous writings had shown a strong interest. In 1831 she published, under the title of "Traditions of Palestine," a series of sketches of the Holy Land during the period of Christ's ministry. In the same year she obtained prizes from the British and foreign Unitarian society for three "Tracts on "The Heathen as Unfolded by the Prophets," "Providence as Manifested through Israel," and "The Essential Faith of the Christian Church." About this time she conceived the plan of issuing a series of monthly stories illustrating the leading principles of political economy. The society for the diffusion of useful knowledge, to which she at first applied, refused to enter into the project, and it was only after many rebuffs and disappointments that she succeeded in finding a publisher. The immediate and remarkable success with which the first tale was received repaid the authoress for her perseverance. The series extended to 24 stories, which were many times reprinted and translated into French and German, and which fixed her reputation as an earnest thinker and a writer of fiction. The "Illustrations of Taxation" and "Poor Laws and Paupers," which next appeared, were written with the same plan, and also published serially. In 1834-6 she travelled extensively in the United States, and on her return recorded her impressions of American life and institutions in a work entitled "Society in America" (1837). She also published in 1838 her "Retrospect of Western Travel," which gave more of her personal experiences. In the following year appeared "Deerbrook," her first and most popular novel; in 1846, "The Hour and the Man," a work of fiction founded on the career of Toussaint l'Ouverture; and about the same time a series of tales for children entitled "The Playfellow," among which were "The Settlers at Home," "Feats on the Florid," and "The Crofton Boys." Her health, which had been delicate from childhood, became so seriously affected in 1839 that she was long obliged to desist from all literary occupation. In 1843 she published "Life in the Sick Room." On recovering through the agency, as she believed, of animal magnetism, she published in 1844 an account of the treatment in a letter which
excited much attention. Her next works were "Forest and Game Law Tales" (1845), and "The Billow and the Rock" (1846). In 1846, in company with her friends Mr. and Mrs. Richard V. Yates, she undertook an oriental tour, of which an account appeared in her "Eastern Life, Past and Present" (1848). Her next important publication was a continuation of the "History of England during the Thirty Years' Peace, 1814-1846," begun by Mr. Charles Knight, but of which only the first book had appeared (2 vols. 4to, 1849–50; "Introduction," I vol., 1851). In the same year she published her correspondence with Mr. H. G. Atkinson on "The Laws of Man's Nature and Development," which abounds in curious revelations of her own psychological experiences, and manifests a decided leaning toward the principles of Comte. Her philosophical views were still more plainly set forth in a condensed version of Comte's "Positive Philosophy" (1853; 2d ed., 2 vols., 1871–2). Among Miss Atkinson's other writings are "Five Years of Youth;" "How to Observe," a work for travellers, published in "Knight's Series;" "The Maid-of-all-work;" "The Housemaid;" "The Lady's Maid;" "The Dressmaker;" "Household Education;" a "Complete Guide to the Lakes" (1854); "The Factory Controversy" (1855); "Local Dues on Shipping" (1857); "British Rule in India" (1857); "England and her Soldiers" (1859); "Endowed Schools for Ireland" (1859); "Health, Husbandry, and Handicraft" (1861); "Steps in the Dark" (1864); and "Biographical Sketches" (1869). She has been a frequent contributor to periodicals and to the editorial columns of the London "Daily News," and has twice, on conscientious grounds, refused a government pension.

11. James, an English Unitarian clergyman, brother of the preceding, born in Norwich about 1805. He studied at the Unitarian college in York, and was settled successively over chapels in Dublin and Liverpool. In 1833 he was called to the chair of moral and mental philosophy in Manchester New college. In 1837 he went with the college to London, and in 1869 became its principal, but retired in 1874. In 1859 he became joint pastor with the Rev. John James Taylor of the principal Unitarian chapel in Little Portland street, of which he was sole minister from 1861 to 1874. He was engaged in a controversy with 13 clergymen of the church of England, in a series of lectures afterward collected and published in two volumes, entitled "Unitarianism Confuted" and "Unitarianism Defended." He is the author of "The Rationale of Religious Inquiry" (1856); "Endeavors after the Christian Life" (2 vols., 1843; 5th ed., 1875); "Miscellanies," edited by the Rev. Thomas Starr King (Boston, 1852); "Studies of Christianity," edited by the Rev. William R. Alger (Boston, 1856); "Essays, Philosophical and Theological" (2 vols., 1866–9); "Studies of Christianity" (1875); and many articles in the "Westminster," "National," and other English reviews and journals.

MARTINET, Achille Louis, a French engraver, born in Paris in 1806. He studied under eminent artists, and in 1826 won the second, and in 1830 the first grand prize of Rome, where he spent five years. In 1855 he exhibited in Paris his engraving of Rembrandt's famous portrait of himself. He was so felicitous in his subsequent engravings from the works of the great Italian masters, that almost all prominent contemporary painters engaged him to engrave their pictures. One of his finest pieces is the engraving of Ary Scheffer's portrait of M. Viardot. Among his latest works are engravings of "The Nativity," by Murillo (1869); "The Virgin with the Pink," by Raphael (1872); and "The Martyrdom of St. Julitte and her Sons," by Heim (1873).

MARTINEZ DE LA ROBA, Francisco, a Spanish statesman, born in Granada, March 10, 1789, died Feb. 18, 1873. He became professor of moral philosophy at Granada when only 19 years old. He took an active part in the Spanish war of independence, was sent to ask arms and munitions of war from the governor of Gibraltar, and went on a similar mission to England, where he studied the institutions of constitutional government. He was imprisoned on account of his liberal opinions from 1814 till 1820, when the revolution set him at liberty, and he was for a time at the head of the cabinet. After the subversion of the constitution by French interference (1823), he spent several years in Paris, engaged in literary pursuits. He was made prime minister by Maria Christina in 1834, and promulgated the estatuto real, or new constitution; but the revolt of the Basque provinces led him to resign. During Espartero's regency he was ambassador in Paris and Rome, subsequently a member of Narvaez's cabinet, and from 1847 to 1851 again ambassador in Paris. After his return to Madrid he was twice chosen president of the senate, and in 1858 appointed president of the council of state. He was the author of many dramas, of which the best known is La conjuracion de Venceia; Isabel de Solis, a novel; a collection of Poemas; and a review of the French revolution, entitled Espiritu del siglo (10 vols., 1835–51).

MARTINI, Giambattista, an Italian composer, born in Bologna, April 25, 1706, died there, Aug. 4, 1784. He entered the order of Franciscans, visited Asia, and on his return was appointed chaplain to a Franciscan convent in Bologna. He was an industrious composer of church music, and published two musical treatises, an "Essay on Counterpoint" and a "History of Music" (3 vols. 4to, 1757–81).

MARTINIQUE, or Martinique, one of the West India island group belonging to France, the Windward group, lying between lat. 14° 28' and 14° 53' N., and long. 60° 50' and 61° 19' W., 30 m. S. E. of Dominica and 20 m. N. of St. Lucia; length 45 m., greatest breadth 15
m.; area, 381 sq. m.; pop. in 1868, 158,884, including 16,618 coolies and about 20,000 whites. The island is irregular in form, high, rocky, and volcanic, containing five or six extinct craters. It is subject to earthquakes, of which several have been disastrous. In the interior are three mountains, the highest of which, Mont Pelée, in the north, 4,438 ft. above the sea, after a long period of inaction, burst forth in a violent volcanic eruption in August, 1851. From these mountains several ranges of low volcanic hills extend to the sea, and between them lie broad, fertile valleys. The rivers are numerous, but all small; most of them in the rainy season become fierce torrents. The coasts are indented by many bays, which are difficult of access. The E. side of the island, called Cabes-Terre, is more broken and sterile than the W., called Basse-Terre. About one third of the surface is under cultivation; the principal productions being sugar, coffee, cotton, cassia, manioc, bananas, indigo, maize, cacao, and ginger. The climate is mild, and the average annual fall of rain is 84 inches. The year is divided into two seasons, one commencing about Oct. 15 and lasting nine months, and the other comprising the rest of the year. During the latter season the rains are abundant, and yellow fever and similar diseases prevail. The mean annual temperature of the plains is 81° F. The value of the agricultural produce in 1869 was 12,730,334 francs.; the number of cattle is about 150,000. The manufactures possess considerable importance; there are several establishments for the preparation of indigo, about 100 for the various processes in the preparation of sugar, coffee, cocoa, and cotton, besides potteries, lime kilns, and steam mills. There is an active commerce, chiefly with France. The exports are sugar, coffee, cocoa, cassia, dye and cabinet woods, cotton, rum, &c. The value of exports in 1869 amounted to 32,115,400 francs., and that of imports to 30,864,177; and the aggregate value of the import and export trade of France with Martinique was 40,984,549 francs. The number of vessels entering the ports in that year was 803; cleared, 858.—There is a governor, a privy council of seven members, and a colonial council of 30 members elected for five years. The judiciary consists of a supreme court, and two assize and two inferior courts. The capital is Fort Royal or Fort de France, but St. Pierre is the largest town and the chief seat of commerce.—Martinique, called by the Indians Madiana, was discovered by Columbus in 1502. The French colonized it in 1635, and during the war of American independence made it a great naval station. The British seized it in 1762, 1781, 1794, and 1809, finally restoring it by the treaty of Paris in 1814. The slaves rebelled in 1822, 1833, and 1839; slavery was abolished in 1848. Since 1866 the colony has legislated for itself on duties and public works. A railway is in progress of construction (1875) from Fort Royal to St. Pierre.

MARTINSBURG, a town and the capital of Berkeley co., West Virginia, on the Baltimore and Ohio railroad, at the terminus of the Cumberland Valley line, 210 m. E. N. E. of Charleston, and 65 m. W. N. W. of Washington; pop. in 1870, 4,863, of whom 476 were colored; in 1874, about 6,000. It is lighted with gas, supplied with water at a cost of $90,000, and has handsome agricultural fair grounds, a commodious court house, a town hall, and a market house. The Baltimore and Ohio railroad has here extensive shops, and employs about 600 persons. The principal manufactories are a foundery, a planing mill, three grist mills, and a large distillery. There are three banks, with an aggregate capital of $200,000, six school houses, a female seminary, a daily and two weekly newspapers, and 11 churches.

MARTIN, Henry, an English missionary, born in Truro in 1783, died in Tokat, Asia Minor, Oct. 16, 1812. He was educated at St. John's college, Cambridge, where he obtained a fellowship in 1802. In 1803 he entered the ministry, and in 1805 set sail for India under the auspices of the African and eastern missionary society. He resided at Bengal as chaplain, and travelled for several years in India and Persia, preaching and studying the native languages. He was chosen to superintend the translation of
of the New Testament undertaken by direction of the missionary society into Hindostanee and Persian. He had also made some progress in an Arabic version when his failing health compelled him to suspend his labors. His life was written by the Rev. John Sargent (1819).

**MARTYNIA**, a genus of plants, named in honor of Prof. John Martyn, of Cambridge, Eng., and belonging to a suborder of the Bignoniaceae, which some botanists regard as entitled to rank as an order, the sesamceae. They are low branching annuals, with thick stems, which, as well as the simple rounded leaves, are clammy pubescent, and the whole plant has a rather heavy unpleasant odor. The flowers are in racemes, large, bell-shaped, five-lobed, and somewhat two-lipped; fertile stamens two or four. The fruit is an oval pod terminated by a long, slender, incurved beak, fleshy at first, but toward maturity becoming woody, and when quite ripe the beak splits into two hooked rigid horns, liberating numerous black and wrinkled seeds. There are six or eight species, natives of warm countries, except one indigenous to the United States and found as far north as southern Illinois. Some of the species are cultivated as ornamental plants, their large, showy, red and yellow flowers strongly resembling those of the gloxinias. *M. fragrans*, from Mexico, has violet-purple flowers, which give off a pleasant vanilla-like odor. The native species, *M. proboscidea*, is sometimes called the unicorn plant, and is cultivated in gardens for the sake of its young fruit; the flowers in this species are dull white or purplish and spotted with yellow and purple. The young pods, taken when still thoroughly succulent, are used for pickling, and are by many considered better than any other vegetable for the purpose. In the southern states the fruit is called martinoes.

**MARTYR** (Gr. μάρτυς, a witness), a term applied to all who suffer for any noble cause, but in a more limited sense to those who suffer death in order to bear witness to their religious belief. Some early writers bestowed the name of martyrs on all those who had suffered torture for the faith; more generally, however, it was reserved to such as died under the hand of the executioner, or while enduring imprisonment or exile, all other sufferers being designated as “confessors.” It is impossible to fix even approximately the number of the early Christian martyrs. Gibbon endeavored to prove that it was insignificant, but this opinion is not shared by more unprejudiced writers. In most cities where persecution raged, notaries were appointed by the bishops to keep lists of the sufferers, and a record of their trial, sufferings, and death. Of these records many, perhaps most, were destroyed in the persecution of Diocletian, when the Christians were compelled to give up all the books belonging to the churches. Out of what remained of them, supplemented by the local traditions, were afterward compiled the martyrologies of the principal Greek and Latin churches. (See Acta Sanctorum.) These must not be confounded with church calendars, which merely indicate for each day of the year the name of the saint whose festival it is. The martyrlogies moreover indicate the sort of punishment endured, the place and time of martyrdom, and the name of the presiding magistrate. The “Roman Martyrology” aims at combining a complete list of martyrs and saints, with their “acts,” and the days of the month on which their feasts occur.—The memory of the martyrs was held in special honor. The shedding of blood, in the case of unbaptized sufferers, was considered to be equivalent to baptism. Their tombs were guarded with jealous care and decorated with garlands; chapels were built over them; their anniversaries, called natalitia martyrum, were celebrated with enthusiasm; and it became a rule, when the persecutions ceased, to have the body of some martyr or a portion of his remains beneath the altar of every church. The Roman catacombs contain the remains of large numbers of martyrs. Prudentius, after mentioning this fact in one of his hymns, asserts that single numerals on the slabs point out to the spectator the chambers in which a number of martyrs were buried together. This fact was verified by Boldetti (Osservazioni sopra i cimiteri de' santi martiri, Rome, 1720), who discovered 150 martyrs entombed in one chamber in the cemetery of Sant’ Ermete, and 500 in a second, that of San Callisto; while Visconti (Sposizione di alcune antiche iscrizioni cristiane, Rome, 1824) designates another chamber containing 118 bodies. From this great storehouse the Roman Catholic churches are chiefly supplied, the altar stone on which the mass is offered always containing a relic of some martyr.

For the process followed in the canonization of martyrs, see Benedict XIV., De Serrorum Dei Beatificatione, et Beatorum Canonizatione, abridged in Faber’s “Essay on Beatification and Canonization” (London, 1848). On the general subject of early Chris-
tian martyrs, see Ruinart, Acta Primativa et Sincera Martyrum (fol., Paris, 1689); Neander's "Church History; and Bingham's "Antiquities of the Christian Church."—By Pro-estants the term martyr is also applied to those who have suffered death as "heretics" at the hands of Roman Catholics in the perse- cutions of the Albigenses, the Waldenses, and the reformers in England, France, Spain, Ger- many, and the Netherlands. In Scotland those who suffered death as Covenanters or Cam- eronians during the persecutions in the reigns of the last Stuart kings are also considered as martyrs. Fox's "Book of Martyrs," which first appeared in London in 1663, and is still a popular work, details with much minuteness the persecutions of the Protestant reformers by the Roman Catholics in England and Scot- land, "from the year of our Lorde a thousand unto the tymne now present." It gives especial prominence to the persecutions in the reign of "bloody Queen Mary," when Cranmer, Lay- mer, Ridley, and several hundred other Protes- tants were burned at the stake for their faith. MARTYR, Peter. I. An Italian historian and geographer. See ANCHERA. II. A Protestant reformer. See VERMIGLI. MARTYROLOGY. See Acta Sanctorum, Boll- land, and MARTYR.

MARVELL, Andrew, an English author, born at Kingston-upon-Hull, Nov. 13, 1620, died in London, Aug. 16, 1678. He was the son of the Rev. Andrew Marvell, master of the gram- mar school and lecturer of Trinity church in Hull, and at the age of 16 was sent to Trinity college, Cambridge. He is said to have taken his degree of B. A. in 1638, and subsequent to 1641 he passed four years on the continent, remaining a considerable time in Italy, where he probably contracted his intimacy with Mil- ton, which was interrupted only by the death of the latter. Subsequently he was a private tutor, and in 1657 was associated with Milton in the Latin secretariyship. About 1660 he was returned to parliament from Hull, a post which he filled by successive elections until the close of his life. He is said to have been the last member of parliament who received "wages" from his constituents. Between 1661 and 1663 he was in Holland, and from July in the latter year to 1665 he acted as secretary to Lord Carlisle, the ambassador extraordinary to Russia, Sweden, and Denmark. He main- tained a close correspondence with his consti- tuents, sending them during the greater part of his legislative career a daily account of the proceedings in parliament. These letters, first published in 1777, are written in a laconic, business-like style, and afford a curious illus- tration of the ability and fidelity with which Marvell performed his public duties. He never spoke in parliament, but his strong views of the corrupt practices of the time, his biting satires in prose and verse on influential place- men, and the conviction that he was not to be silenced by bribes or flattery, made him a formidable enemy to the court. It is even said that he was threatened with assassination. His probity and honor earned for him the name of the "British Aristides." He died sud- denly, supposed by some to have been poisoned, for which there seems to be no reasonable ground, and was buried in the church of St. Giles-in-the-fields at the expense of his con- stituents, who also voted a monument to his memory, which the rector refused to have erected. His chief work in prose is the "Re- hearsal Transposed," a satirical reply to an acrimonious attack by Dr. Samuel Parker, after- ward bishop of Oxford, upon the noncon- formists. In the second part of the "Rehears- sal," one of the most remarkable passages is the author's defence of Milton. His last work, "An Account of the Growth of Popery and Arbitrary Government in England" (1678), was so distasteful to the court, that a reward was offered for the discovery of the printer, and Marvell was compelled frequently to con- ceal himself. His poems comprise political satires, written in a coarser strain than his prose works, and some minor pieces of great tenderness and beauty, including the well known commendatory lines on Milton's "Par- adise Lost." A full edition of his works was published in 1776 (3 vols. 4to); and there is an American edition of his poems, edited by James Russell Lowell (Boston, 1857; reprint- ed, London, 1870). The first volume of a complete edition of his works, with notes and a memorial, by A. B. Grossart, to comprise four volumes, appeared in London in 1872. MARVEL OF PERU, a garden name for plants of the genus mirabilis, also called four o'clock. The genus belongs to the family nyctaginaceae, and includes about half a dozen species, natives of the warmer parts of America. Though they are tuberous-rooted perennials, they bloom early from the seed, and are usually treated as annuals; the roots may be kept through the winter in the cellar and planted out in spring, when they will flower much earlier than plants from seed. The stems are jointed, and tumid at the joints at which are borne the opposite, simple, more or less heart-shaped leaves; the flowers are one or more from a large cup-shaped involucre, without petals, but the funnel-shaped calyx is petal-like and forms the showy portion of the flower; the stamens are five, and with the single style are protruded; in maturing, the lower portion of the calyx hardens to form a false pericarp around the fruit proper, while the upper portion falls away; this wonderful manner of forming what appears to be the fruit is said to have suggested the name mira- bilis for the genus. The common four o'clock of the gardens is M. Jalapa, so called because at one time it was supposed to be the plant which furnished the medicine jalap; the tube of the flower is about 2 in. long; the colors are white, yellow, and various shades of red, often pleasingly variegated in the same flower, in blotches and stripes; in some flowers one
portion is pure white and the other red, the line of demarcation being perfectly distinct; in this species there is but one flower to each involucre, which in this case exactly represents a calyx. This plant was introduced into cultivation in 1596, and still retains its popularity; the flowers open toward sunset, or earlier in cloudy weather; a fact recognized in the name four o’clock; it is also known as afternoon lady, and the French call it belle de nuit. The long-flowered marvel of Peru (M. longiflora) has white sweet-scented flowers, the tube of which is 6 in. long, hairy and sticky. This species and the preceding have been hybridized, and varieties partaking of the peculiarities of both produced; the hybrids frequently produce fertile seeds. M. Wrightiana, from Texas, is in cultivation; the flowers are white, tinted with rose. As generally seen in gardens, the plants of marvel of Peru are crowded too much; in order to exhibit their beauty, they should be cultivated as isolated specimens.

**MARX**. See Jooopnoor.

**MARX, Adolph Bernhard**, a German composer, born in Halle, Nov. 27, 1790, died May 17, 1869. He held a judicial office at Nuremberg, but subsequently devoted himself exclusively to the study of music. In 1823 he became editor of the Berliner allgemeine musikalische Zeitung, and in 1830 was appointed professor of music in the university of Berlin. His principal works are: *Die Lehre von der musikalischen Composition* (Leipsic, 1834-45; 6th ed., 1865 et seq.; English translation by Saroni, New York, 1852); *Allgemeine Musiklehre* (1839; 7th ed., 1863); and *Die Musik des 19. Jahrhunderts und ihre Pflege* (1855). He wrote treatises on the “Art of Singing” (1829), “Painting in Music” (1829), &c., besides many articles in Schilling’s *Lexikon der Tonkunst*. He is known as a composer by several musical dramas, symphonies, &c., and by his oratorio “St. John the Baptist.” He also published

Ludwig von Beethoven: Leben und Schaffen (Berlin, 1855; 2d ed., 1863); *Gluck und die Oper* (1802); and Denkwürdigkeiten aus meinem Leben (2 vols., 1865).

**MARX, Karl**, a German socialist, born in Treves in 1818. He completed his studies in Bonn and Berlin, and became in 1843 chief editor of the Rheinische Zeitung in Cologne. That journal was suppressed in 1848, he associated himself in Paris with Arnold Ruge in a critical revision of Hegel’s “Philosophy of Jurisprudence,” and with Friedrich Engels in the publication of Die heilige Familie, directed against Bruno Bauer and kindred writers. At the same time he attacked Prussia in the press, and at the request of that power he was expelled from France in 1846 and went to Brussels, where he and Engels published in 1848 a manifesto embodying the views of an international congress of workmen held at London in the preceding year; and he was then also expelled from Belgium. The revolution of 1848 enabled him to return to Paris and to Cologne, where he speedily founded the Neue Rheinische Zeitung, a revolutionary journal advocating the refusal of taxes as long as liberty was not established. His continued agitation involved him in perpetual conflicts with the authorities, and in 1849 he was expelled on account of his connection with the insurgents in the grand duchy of Baden. He once more went to Paris, and after the insurrection of June 18 to London, where he has since lived. He issued here in 1850-51 a monthly edition of the Rheinische Zeitung, printed at Hamburg. In 1864 he was admitted as member of the newly established Internationale, and drew up the manifesto and statutes of this association, which were adopted in 1866 at the congress of Geneva, and henceforth he was officially recognized as the master spirit of that organization. (See International Association.) His principal works are: *Minére de la philosophie: Réponse à la Philosophie de la misère de Proudhon* (Brussels, 1847); *Zur Kritik der politischen Ökonomie* (Berlin, 1859); *Das Kapital: Kritik der politischen Ökonomie* (1859); and *Herr Vogt* (London, 1860), in which he accused Karl Vogt and his adherents of having sold themselves to Napoleon III.

**MARY** (Gr. Mapia and Mapada), the mother of Jesus. But little is recorded of her history in the Scriptures. Some authorities consider Luke’s genealogy to be that of Mary, and Heli (Luke iii. 23) to have been her father. Epi- phanius says that her parents were Joachim and Anna. Joachim or Jehoiakim and Eliakim are interchangeable (2 Chron., xxxvi. 4), and Eli or Heli is the abbreviation of the latter. The Latin as well as the eastern churches hold her father to be St. Joachim, whose feast is celebrated on the Sunday next following Aug. 15. The next mention of her is as a young maid- en at Nazareth, where she was betrothed to a carpenter named Joseph. A heavenly mes- senger announced to her that through the over-
shadowing of the Holy Spirit she should conceive a son, who should be called the Son of God, and who would be the Messiah expected by the Jews. Almost immediately on receiving this announcement Mary hastened from Nazareth to visit her cousin Elizabeth, who was residing in the hilly district in "a city of Judah." While there, she uttered the Magnificat, a hymn which the Christian church has delighted from the earliest times to use as an expression of thanksgiving. After a sojourn of three months, she returned to Nazareth, when Joseph suspected her of infidelity, and resolved, in order to avoid a public exposure, to dismiss her privately. But an angel (Matt. i. 18-25) informed him in a dream of the true state of the case, and enjoined him to take Mary as his wife. He complied with this order, and was therefore regarded by the Jews as the father of Jesus. Soon after, when Augustus ordered a census to be taken throughout the empire, Mary went with Joseph to be enrolled at Bethlehem, the city of David, and there gave birth to Jesus. According to the law of Moses, she offered him in the temple (Luke ii. 22 et seq.), and returned with Joseph and the child to Nazareth, whence the whole family had to flee to Egypt. After the death of Herod they again took up their residence at Nazareth. When Jesus was 12 years old, Mary visited Jerusalem with him and Joseph at the time of the passover. On their return Jesus was missed from the company, and she discovered him sitting in the temple disputing with the doctors of the law. She was present at the marriage feast in Cana, where she drew her son's attention to the failure of the wine. After this event she appears to have lived alternately with her kinsfolk at Nazareth and Capernaum. She is thought to have come to Jesus to remonstrate with him on his wasting labors (Matt. xii.), while he was surrounded by a great crowd. The Gospel is then silent about her till she appears standing beneath the cross, and is consigned by Jesus to the care of the beloved disciple John. Thenceforward John's house is her home. The last mention made of her in the New Testament is in Acts i. 14, where it is stated that after the ascension she remained in the upper chamber, persevering in prayer with the holy women and the disciples and apostles. Some ancient writers, like St. Epiphanius, have thought it probable that she passed the rest of her life with John at Jerusalem. Another tradition says that she lived and died in the upper chamber, the scene of the last supper, now supposed to be the site of the mosque of the tomb of David. According to others, she accompanied John to Ephesus, and died there in extreme old age. In the 5th century opinion in the East was divided respecting her burial place, Ephesus and Gethsemane both claiming to possess her tomb. Some legendary particulars relating to her early life, derived from the apocryphal gospels, have come down from century to century. Such is the story of her betrothal to Joseph, with all its miraculous circumstances, as painted by Perugino, and afterward by his pupil Raphael. A tradition relating to the place and manner of her death says that she was buried at the foot of the mount of Olives. Some of the apostles, it is said, having come to Jerusalem the third day after her death, found it empty and exhaling a sweet fragrance. This incident is also the subject of one of Raphael's pictures. Mary is the object of a special veneration in the Roman Catholic church, which honors the saints with the worship known as dulia, a religious service rendered them on account of the supernatural gifts wherewith it holds that God has distinguished them, but decrees to the Virgin the ampler honors of hyperdulia, placing her high above all created objects of religious respect on account of her singular prerogative as mother of God, and of the virtues with which she adorned this dignity. The early fathers of the church, Justin Martyr, Tertullian, Ireneus, and others, call her the second Eve. From the office thus assigned to her some Roman Catholic theologians deduce the immaculateness of her conception. Pope Pius IX., on Dec. 8, 1854, declared it to be a revealed doctrine that Mary was preserved from the stain of original sin by the merits of her Son. Controversies in reference to the proper position of Mary arose early in the history of the church. Those of the innovators who denied the divinity of Christ, as the Arians, denied her of course the title of mother of God, and so did they who denied the humanity of the Word, as the Eutychians; while the Nestorians, asserting a double personality in Christ, allowed her only the maternity of the human hypostasis. Further disputes occurred about the perpetual virginity of Mary. The church insisted upon the belief that Christ was born of a virgin mother, in accordance with the Apostles' Creed, reaffirmed by the Nicene and Athanasian symbols; and the council of Ephesus decreed explicitly that Mary was the mother of God (Greekos), and condemned all who denied her that title. The Cerinthians taught first that Christ was born of Joseph and Mary, and their doctrines were repeated by Helvidius in Palestine and Bonosus in Illyria, their later followers adding that several children were born to Joseph and Mary after the birth of Jesus. Questions existed, until silenced by authority, between Catholic schools of theology, as the Thomists and Scotists, and between certain religious orders, as the Franciscans (who followed Duns Scotus) and the Dominicans (who upheld St. Thomas), in reference to Mary's conception, which the former held to have been utterly immaculate of all sin, and the latter maintained not to have been immaculate, or not at least from the earliest instant of her existence. (See IMMACULATE CONCEPTION.)—Many festivals are celebrated in the Roman Catholic church in honor of Mary. Her conception is commemorated by the feast.
of the Immaculate Conception (Dec. 8); her birth by the Nativity (Sept. 8); the message of the angel by the Annunciation (March 25); her visit to Elizabeth by the Visitation (July 2); her visit to the temple by the Purification (Feb. 2); and her ascent to heaven by the Assumption (Aug. 15). The Nativity and Assumption are celebrated by both Greek and Latin churches. In the 11th century it became the custom in some places to honor her by special devotions on Saturdays, and later to devote the month of May to similar practices of piety.

These devotions are nowhere a matter of obligation. An Officiium Batae Mariae Virginis was added to the breviary, and declared by Pope Urban II. (1095) to be obligatory on the clergy of the whole church. Several religious orders called themselves after Mary. To her intercession so great importance is attributed that the Ave Maria (Hall Mary) is generally used in connection with the Lord's prayer. Many other devotional exercises in her honor, especially the beads or rosary (see Bead), are in common use; and the wearing of the scapular, which she is believed to have given to the general of a religious order, Simon Stock, with the promise of special favors to all who wear it in her honor, was encouraged by several popes, who attached to it many indulgences.

The house in which Mary dwelt at Nazareth is believed in Italy to have been transported by angels to Loreto. The miraculous cures ascribed to the intercession of Mary are innumerable; a collection of some belonging to recent times may be found in the "Annals of the Archconfraternity of the Immaculate Heart of Mary," an association which was established in Paris in 1830. Many towns in every Catholic country possess celebrated images of Mary, which attract crowds of pilgrims during the year or on stated festivals.—See Canisius, De Maria Virginis (Ingolstadt, 1777); Home, "Marianatry" (London, 1841); Tyler, "Worship of the Blessed Virgin Mary" (London, 1844); Mrs. Jameson, "Legends of the Madonna" (London, 1832); Genthe, Die Jungfrau Maria (Halle, 1852); T. S. Preston, "Ark of the Covenant" (New York, 1860); Cardinal Wiseman, "Lectures on the Church" (Baltimore, 1862), and "Sermons" (New York, 1874); Pusey, "Eirenicon" (London, 1866); and Newman's reply to "Eirenicon" in "Difficulties felt by Anglicans" (London, 1874).

MARY I., first queen regnant of England and Ireland, fourth sovereign of the Tudor line, and daughter of Henry VIII. and of Catharine of Aragon, born at Greenwich palace, Feb. 18, 1516, died at St. James's palace, Nov. 17, 1536. She was severely educated, according to a code of instructions drawn up by Ludovico Vives. She was the object of various matrimonial negotiations in her infancy; it was proposed by treaty in 1518 that she should marry the dauphin, son of Francis I. of France, and in 1522 she was betrothed to the emperor Charles V. He desired that she should be sent to Spain for education, but her parents would not consent to part with her, though they gave her a Spanish education. A Scottish match was proposed in 1524. Her father was at that time passionately attached to her, declaring her heir to the crown, and, according to one authority, creating her princess of Wales. She had a magnificent court at Ludlow castle, her chamberlain being that Dudley, duke of Northumberland, who in after days sought to prevent her from ascending the throne, and whom she sent to the scaffold. The countess of Salisbury, the last of the Plantagenet family, was at the head of her establishment. The emperor broke his contract with her on the ground that her father, by seeking a divorce from her mother, was seeking also his daughter's degradation. Henry then sought to marry her to Francis I., but that prince took for his second wife the emperor's sister Eleanor. Catharine wished her daughter to marry a son of Lady Salisbury, whose brother, Warwick, had been made, by Henry VIII., Duke of Norfolk. The demand of Ferdinand of Aragon, before he would consent that his daughter should marry a prince of the house of Tudor. This son was the famous Reginald Pole, afterward cardinal. Her hand was asked for the duke of Orleans, second son of Francis I., but vainly. After the birth of Elizabeth, Mary was degraded from the position she held; and when James V. of Scotland asked her in marriage, his suit was refused, from the fear that issue from such union would interfere with the title of Anne Boleyn's children to the crown. As she refused as far as she could, it was reported that her father was indignant, and that her life was in danger. The treatment she received justified the fears that were entertained, and the emperor interfered in her behalf. After Anne Boleyn's death (1536) Mary was better treated; but her father's object, which was a renunciation of her right to the succession, was not obtained until some time after this change, when she signed articles acknowledging that her mother's marriage was incestuous and illegal, her own birth illegitimate, and the king's supremacy over the church absolute. She was then restored to some favor. Her hand was again asked for the duke of Orleans, and she stood sponsor to the young prince who was afterward Edward VI.

Negotiations for her marriage with various princes were fruitlessly made, among them being the prince of Portugal, the duke of Cleves, and the duke of Bavaria. As she was regarded as the head of the Catholic party, she was an object of suspicion to her father and to the Protestants, and her situation was made painful by the legal murder of most of her friends, including the countess of Salisbury; but in 1544 she was restored to her place in the line of succession by act of parliament. She lived on the best terms with her last stepmother, Catharine Parr, and at her instance translated Erasmus's Latin paraphrase of St. John. During the reign of Edward
MARY I.

VI. she took no part in politics, though she was denied the free enjoyment of her religion. Suitors for her hand continued to present themselves: the duke of Brunswick, the grand-duke of Brandenburg, and the infant of Portugal. The emperor threatened war if she were not exempted from the penalties prepared for non-conformists, and she was suspected of intending to take refuge at his court. On the death of Edward VI. (July 6, 1553) Mary succeeded him, after a brief but unimportant struggle with the partisans of the Dudley's and Greys, who had set up Lady Jane Grey as queen. She was merciful to the fallen, only three persons being executed for treason; and she refused to bring the lady Jane to trial, saying that she was merely a tool of Northumberland. A reaction in the government took place, for which the queen was less blamable than her councillors, the principal of whom was Bishop Gardiner, who was made lord chancellor Aug. 29, 1553. Mary interfered to prevent the perpetration of cruelty by the privy council, and the early part of her reign was mild. Her coronation took place Oct. 1, 1553. Her first parliament met four days later, and restored the laws relating to life and property to the state they were in at the 25th of Edward III., and annulled all the acts that cast a stain on the queen's legitimacy. The religious laws of Edward VI. were repealed, and the church of his father was restored, making Mary its head, much against her will; but while she held the post, the Protestants were not persecuted. Lady Jane Grey was attainted, but it was known that the queen intended to spare her life. Mary's resolution to marry Philip of Spain caused great alarm to her subjects. Formidable mutinies took place in the years 1553 and 1554, which were not quelled without much exertion, and in the course of the brief rebellion the queen showed both courage and capacity. The effect of this struggle was to give entire ascendancy to the reactionary party in the royal councils. The death warrants of Lady Jane Grey and her husband, and of other persons, were signed; and the queen was urged to put to death her sister Elizabeth and the earl of Devonshire, who, however, were only sent to the tower. When her ministers would have punished the rebels with that sweeping slaughter which characterized most of the Tudor reigns, she interfered, and saved their lives. The marriage of Mary and Philip took place July 25, 1554. It proved fatal to Mary's peace, and most injurious to her character and reputation. On Nov. 30 Cardinal Pole declared England and Rome reconciled, and those persecutions which have made of Mary's reign a by-word and a reproach were commenced with the burning of John Rogers, Feb. 4, 1555. According to many historians, they were due to the influence of Gardiner and Bonner, who were not a fair judges of the times. Rankes gives credit to Gardiner's assertion that the queen herself, and not he, insisted on the revival of the old laws against the Lollards; and though he admits that many of the horrors of their execution may have been kept from her, he adds that no apology will free her memory from the dark stain that clings to it: "for whatever is done in the name of a prince, with his will and by his authority, decides his reputation in history." Mary was neglected by her husband, to whom she was warmly attached. For his sake she declared war with France, June 7, 1557, and English forces took part in the battles of St. Quentin and Gravelines. In January, 1558, the French captured Calais, which the English had held for more than two centuries. War with France brought on war with Scotland. The loss of Calais was so mortifying to the English, that they insisted that Philip should make no peace with France without providing for its restoration. Mary's health had never been good, and she was indisposed during the greater part of her reign, of which circumstance her council took advantage. She suffered from dropsy and nervous debility, and her disappointment from not having children aggravated her illness. She recognized Elizabeth as her successor. In the summer of 1558 she was attacked by intermittent fever, of which thousands of her subjects had died, the consequence of the wet seasons that prevailed throughout her reign. When it was evident that her last hour was at hand, her court was deserted, most of its members hastening to Hatfield, the residence of Elizabeth. She was buried on Dec. 13, in Henry VII's chapel.

MARY II., first queen regnant of Great Britain and Ireland, daughter of James II. and wife of William III., born at St. James's, April 30, 1662, died at Kensington palace, Dec. 28, 1694. Her father at the time of her birth was heir presumptive to the throne and duke of York, and her mother was Anne Hyde, daughter of the earl of Clarendon. She was educated at Richmond palace, with her sister Anne, her preceptor being Henry Compton, bishop of London, and was a very well informed woman for those times. She was married to her cousin, William, prince of Orange, Nov. 4, 1677, an alliance which was very popular throughout Great Britain. Mary's father, as heir presumptive to the British crown, was an object of jealousy to all Protestants except the high churchmen, and even they saw with pleasure that his heir, the princess of Orange, was strongly attached to the church of England. William was jealous of his wife's position, as, should she succeed to the throne, she would be his superior in rank and power; and should she die before him, and childless, the throne would pass to her sister Anne. William stood next in the order of succession to Anne, and all hope of Charles II. having legitimate offspring had long been abandoned. The prince was the personal difficulties between him and his wife were removed before those of a political character were known to her. Burnet, afterward bishop.
of Salisbury, effected a complete reconciliation between the prince and princess, the latter pleading herself to surrender all power to her husband, should circumstances ever place her on the British throne. When William found himself compelled to take the leadership of that comprehensive opposition party which was formed in England against James II., in 1687-8, he was strenuously supported by Mary against her father. The latter had never since her marriage treated her well, had used some of her friends harshly and illegally, and had conspired to take from her the crown of Ireland; and she shared in the common belief that the prince of Wales, born in 1688, was a supposititious child, who had been introduced into the royal family to prevent her from ever enjoying her inheritance. She acquiesced in the plan for the invasion of England in 1688; and when the earl of Danby sought to obtain the throne for her on the ground that there had been a demise of the crown, and that she was the next heir, she wrote him an earnest remand, declaring that she was the prince's wife, that she had no other wish than to be his subject, that the most cruel injury that could be done to her would be to set her up as his competitor, and that she never could regard any person who took such a course as her true friend. Could William have had his way, he would have reigned alone, and Mary would have been only queen consort; but the opposition to this plan was so great that it was never pressed. The convention parliament declared William and Mary king and queen of England. Mary arrived in England on Feb. 12, 1689, and on the 13th she and her husband accepted the crown. William had requested her to assume a cheerful air, in order to set aside the report that she thought she was wronged; and she so far overlooked her part that her levity gave general offense and occasioned many lampoons. The coronation took place April 11, 1689, when Mary was inaugurated like a king. During the absence of her husband, when in Ireland or on the continent, Mary was placed at the head of the government, and in that position showed tact and firmness under very trying circumstances. In 1692, after the naval victory of La Hogue, she declared that Greenwich palace, then in course of construction, should be converted into a retreat for those seamen who should be disabled in their country's service; and the vow thus made was kept. Toward the end of 1694 she was attacked by smallpox, of which she soon died, to the great grief of her husband, to whom her decease was a political as well as personal loss, as her participation in his government gave to it a certain show of hereditary right. The attacks of the Jacobites on her unfaithful conduct continued even after her death. She was buried with great pomp in Henry VII.'s chapel in Westminster abbey.

MARYLAND, one of the original states of the American Union, situated between lat. 37° 53' and 39° 44' N., and lon. 75° 4' and 79° 32' W., having an extreme length E. and W. of 196 m., and a breadth varying from less than 10 m. in the W. part to about 120 m.; area (not including Chesapeake bay, which comprises 2,885 sq. m.,) 11,124 sq. m. It is bounded N. by Pennsylvania, on a parallel known as "Mason and Dixon's line," E. by Delaware and the Atlantic ocean, and W. by West Virginia. The remaining boundary is irregular. E. of Chesapeake bay it is bounded S. by Virginia, on a line E. from the mouth of the Pocomoke river to the Atlantic; W. of that bay it borders S. W. on Virginia and the District of Columbia, and S. on West Virginia, the boundary line (except where interrupted by the District of Columbia) following the Potomac river to the head of its North branch.

The state is divided into 23 counties, viz.: Allegany, Anne Arundel, Baltimore, Calvert, Caroline, Carroll, Cecil, Charles, Dorchester, Frederick, Garrett, Harford, Howard, Kent, Montgomery, Prince George's, Queen Anne, St. Mary's, Somerset, Talbot, Washington, Wicomico, and Worcester. There are five cities, viz.: Baltimore (pop. in 1870, 267,354), the chief commercial and manufacturing mart; Frederick (8,526); Cumberland (8,056), the depot of the mining region in the W. part of the state; Hagerstown (5,779); and Annapolis (5,744), the capital. Cambridge, Chesapeake City, Chestertown, Easton, Elkton, Ellicott City, Havre de Grace, Laurel, Newtown, Port Deposit, St. Michael's, Salisbury, Sharpsburg, Westminster, and Williamsport are towns having each more than 1,000 inhabitants.—The population of Maryland in 1660, according to McSherry ("History of Maryland," Baltimore, 1849), was 12,000; in 1665, 15,000; in 1671, 20,000; in 1701, 25,000; in 1715, 30,000; in 1748, 150,000 (36,000 slaves); in 1758, 154,188 (46,225 slaves); in 1761, 164,007 (49,675 blacks, mostly slaves); in 1775, 200,000; in 1782, 254,050, of whom 83,362 were slaves. According to the federal census returns, it has been as follows:
Included in the last total are 2 Chinese and 4 Indians. In 1870 Maryland ranked 20th among the states in total population, a gain since 1860 of 13.66 per cent.; 18th in white population, gain 17.36 per cent.; 11th in colored population, gain 2.49 per cent. Of the total population, 697,482 were native and 83,412 foreign born. Of the natives, 629,882 were born in the state, 22,846 in Pennsylvania, 20,237 in Virginia and West Virginia, 6,876 in Delaware, 3,890 in New York, 1,553 in New Jersey, 1,212 in Massachusetts, and 1,163 in Ohio. There were 175,660 persons born in the state living in other states and territories. Of the foreigners, 47,045 were born in Germany, 23,690 in Ireland, 4,855 in England, and 2,432 in Scotland. There were 384,984 males and 395,910 females. Of the colored inhabitants, 151,463 were blacks and 23,928 mulattoes. The number of male citizens of the United States 21 years old and over was 169,845. The number of families was 140,075, having an average of 5.07 persons to a family; of dwellings, 129,620, with 602 persons to a dwelling. There were 114,100 persons 10 years old and over who could not read; 135,409 could not write, of whom 126,907 were natives and 8,592 foreigners, 46,796 whites and 88,703 colored, 61,981 males and 73,518 females; 21,572 were from 10 to 15 years of age, 21,459 from 15 to 21, and 92,471 were 21 and over. Of the last number, 13,344 were white males and 27,123 colored males. There were 427 blind persons, 384 deaf and dumb, 733 insane, and 362 idiotic; number of paupers supported during the year ending June 1, 1870, 1,587, at a cost of $163,584; receiving support June 1, 1,612, of whom 265 were foreigners and 506 colored; number of persons convicted of crime during the year, 868; number in prison June 1, 1,035, of whom 68 were foreigners and 663 colored. The number of persons 10 years old and over returned as engaged in occupations was 258,543 (213,691 males and 44,852 females), of whom 80,449 were employed in agriculture, 79,226 in professional and personal services, 35,542 in trade and transportation, and 63,326 in manufactures and mining. Included in these numbers were 48,780 agricultural laborers, 31,219 farmers and planters, 938 clergy, 34,742 domestic servants, 28,571 laborers, 772 lawyers, 1,771 officials and employees of government, 1,257 physicians and surgeons, 2,190 teachers, 9,775 traders and dealers, 9,840 in other mercantile pursuits, 2,859 officials and employees of railroad companies, 3,529 carmen, draymen, teamsters, &c., 5,958 sailors, steamboatmen, watermen, &c., 3,281 blacksmiths, 4,793 boot and shoe makers, 2,806 masons and stonemasons, 1,128 brick and tile makers, 1,566 butchers, 1,335 cabinetmakers and upholsterers, 7,904 carpenters and joiners, 1,086 cigar makers and tobacco workers, 1,483 cooperers, 1,992 cotton and woolen mill operatives, 1,569 fishermen and oystermen, 1,709 iron and steel workers, 1,027 machinists, 1,116 millers, 2,041 milliners and dressmakers, 2,888 miners, 1,943 painters and varnishers, 6,865 tailors, tailoresses, and seamstresses, 1,256 timbers, and 1,056 wheelwrights.—The surface of the eastern shore of Maryland, which forms a part of the peninsula lying between Chesapeake and Delaware bays, is low and level except in the N. part, where it is somewhat broken and rocky. The soil of this region is generally sandy. That part of the western division of the state which forms the peninsula between Chesapeake bay and the estuary of the Potomac presents the same natural features. The northwest is rugged and mountainous. The Blue Ridge, and other main ranges of the Alleghanies, cross it from Virginia and West Virginia into Pennsylvania. None of these chains attains a great elevation.—The seacoast has a length of only 33 m.; but including the whole tide-water region of Chesapeake bay, the shore line is estimated at 411 m., and if the shores of islands be included, at 509 m. The principal rivers belonging wholly or in part to Maryland are the Potomac, Patuxent, Severn, Patapsco, Susquehanna, Elk, Choptank, Nanticoke, and Pocomoke. The rivers of the eastern shore, with the exception of the Choptank and Nanticoke, are rather inlets into which flow numerous small creeks than rivers, and are navigable only near their mouths. On the western shore, however, are the Potomac, navigable about 125 m.; the Patuxent, 50 m.; the Patapsco, 22 m.; and the Susquehanna, navigable beyond the Maryland boundary. Above Washington the Potomac receives the Monocacy river, Antietam creek, the Conococheague river, and many smaller streams. The extreme W. part of the state is drained by the Yonghioghiny river, which through the Monongahela empties into the Ohio. Chesapeake bay, which almost bisects the state, extending northward within 14 m. of the frontier of Pennsylvania, receives nearly all the rivers of Maryland. At its mouth, between Cape Charles and Cape Henry, it is 15 m. wide, its opening facing east; but on penetrating the land it almost immediately changes its direction, its length lying almost due N. and S. A little below the mouth of the Potomac it is about 30 m. wide, after which it again contracts, and at its head breaks off into several small estuaries, just above the mouth of the Susquehanna. It is nearly 200 m. long, and navigable throughout. It contains many small islands, and its shores are indented with innumerable bays and inlets. The

Atlantic coast of Maryland has no harbors, and is bordered throughout by a sandy beach from a few yards to more than a quarter of a mile in breadth, enclosing a shallow lagoon.—In the variety of its geological formations and mineral productions, Maryland is one of the most remarkable states in the Union. Along the seaboard and the shores of Chesapeake bay occur alluvial deposits of the present epoch. Next older are the beds of the pleistocene recognized in St. Mary's co., whence the formation extends southward along the coast of Virginia and North Carolina. The eastern shore is overspread almost exclusively with the clays, sands, and calcareous marls of the miocene; and the same formation is found on the W. side of the bay, reaching back to the E. edge of the metamorphic rocks, the line of which is commonly marked by the lowest falls of the rivers, as they descend from this platform of ancient rocks. The miocene formation is exposed in the banks of the creeks and rivers, and its beds of shell marl are there largely excavated for their valuable fertilizing materials. Deposits of bog ore are found in this formation, as well as in more recent ones. Among the tertiary ferruginous sands and clays spread over the western shore, from the vicinity of Washington to the head of the bay, are numerous deposits of argillaceous carbonate of iron in flat bands and balls. The cretaceous formation enters the N. E. corner of the state from New Jersey and Delaware; but it is lost S. of the Susquehanna river. Immediately back of Baltimore are hills of metamorphic rocks, talcose and mica slates, and limestones, which extend N. E. and S. W. across the state. Among them are serpentine rocks, which constitute barren hills known as the "Bare Hills." In these, beds of chrome iron have been extensively worked, and their products have been converted into chrome pigments, and also exported to Europe. The same formations have yielded large quantities of the silicates and hydrates of magnesia. Mines of copper ore have also been worked in the metamorphic rocks, and others of hematite support numerous blast furnaces; in the same group of rocks are also extensive quarries of limestone and marble. At Sykesville, on the Patapsco, specular iron ore is found, and worked in connection with pyritic copper ores. Passing westward across the metamorphic belt, and included in it, is a narrow strip of the "middle secondary red sandstone," which is traced from New Jersey through Pennsylvania and Maryland into Virginia. It passes through Carroll and the eastern part of Frederick co., crossing the Potomac just W. of Montgomery co. In this region was obtained from this formation the beached marl of which the pillars in the old hall of representatives in the capitol at Washington were made. In Frederick co., along the range of this belt, have been worked several copper mines. The portion of the metamorphic group lying W. of this trough of the middle secondary is but a few miles wide; and in the Catoctin and South mountains, on the W. line of Frederick co., are found the Silurian rocks, the Potsdam sandstones, and the Trenton and associated limestones, the lower members of the Appalachian system of rocks. The calcareous strata overspread the E. portion of Washington co., extending N. in a broad belt into Pennsylvania and S. into Virginia. The finest valleys of the middle states lie on their range, and wherever met with these rocks give fertility to the soil and beauty to the scenery. Newer members of the Appalachian series of rocks succeed toward the west these lower formations, and are repeated with them in successive parallel ridges, which are the eastern members of the Appalachian chain. At Cumberland in Allegany co. commences the ascent of the main ridges. Up their slope the middle Silurian rocks soon give place to the red shales and sandstones of the Devonian, and these are succeeded by the carboniferous formation, which caps the summits of Dan's and Savage mountains, and overspreads the intervening valley of George's creek, as the strata dip in each direction into the trough-shaped basin. At Frostburg, Lonaconing, Westernport, and other points in the valley, is obtained the semi-bituminous coal known in the eastern markets as Cumberland coal. Extensive works have been in operation at Mt. Savage, and also at Lonaconing, converting the iron ores of the coal formation into pig iron, and this into rails and other forms of wrought iron. The supply of ores, however, has proved uncertain, and, like most other attempts to found large operations upon these ores, the enterprises have not prospered. From this point to the W. boundary of the state the country continues mountainous, consisting of parallel ridges and valleys, the former capped by the coal formation or the underlying conglomerate and red and gray sandstones, and the valleys occupied by the coal measures. According to the census of 1870, the number of mining establishments in operation was 80, having 32 steam engines of 888 horse power, and 2 water wheels of 32 horse power; number of hands employed, 3,801 (1,241 above and 2,560 below ground); amount of capital invested, $25,369,730; wages paid, $1,859,952; value of materials used, $205,547; of products, $3,444,188. There were 22 mines of bituminous coal, yielding 1,819,824 tons, valued at $2,409,208; 43 of iron ore, yielding 98,354 tons, valued at $600,000; 24 of copper, producing 871,500 worth of ore; 2 marble quarries, yielding $275,000; 2 slate, and 9 stone quarries. Of the coal mines 20 were in Allegany co. Of the iron 20,487 tons were produced in Baltimore co., 18,800 in Carroll, 1,900 in Frederick, 9,500 in Allegany, and 6,190 in Anne Arundel. The climate of the state is temperate, and in most places salubrious, although the lowlands bordering on the bay are subject to miasmatica which
produce bilious fevers and fever andague. The mean annual temperature in the middle portion of the state is 56°; in the north, 54°; and in the highest parts in the west, 50°. Rain is abundant, the largest annual fall (50 inches) occurring on the W. shore of Chesa-
peake bay. The mean temperature at Balti-
more for each month of the year ending Sept. 
30, 1873, was as follows: October, 58.8°; 
November, 43.6°; December, 32.2°; January, 
94°; February, 55.6°; March, 40.3°; April, 
51.9°; May, 62.2°; June, 75.4°; July, 79.4°; 
August, 76.3°; September, 68°, year, 54.64°. 
The minimum was 2° (in February); the maxi-
mum, 96.5° (in July). The total rainfall was: 
October, 4.06 inches; November, 3.17; De-
cember, 2.72; January, 4.27; February, 4.74; 
March, 3.02; April, 2.77; May, 6.31; June, 
0.94; July, 2.90; August, 9.49; September, 
3.70; year, 45.11. The number of deaths in 
1870 was 9,740, of which 3,978 were from 
general diseases, 1,161 from diseases of the 
nervous, 339 of the circulatory, 1,342 of the 
respiratory, and 1,449 of the digestive sys-
tem, and the rest from miscellaneous causes. 
Among deaths from special diseases were: 
consumption, 1,678; pneumonia, 742; cholera 
infantum, 604; enteric fever, 454; scarlet 
fever, 331; whooping cough, 281; croup, 272; 
encephalitis, 249; convulsions, 239; paralysis, 
281; diphtheria, 218; dropsy, 186; measles, 
177; dysentery, 167; diarrhoea, 157; teething, 
143; and hydrocephalus, 112. — The soil of 
the eastern shore is not naturally rich, but by 
the aid of manure it may be made to yield abun-
dant crops. On the other side of the bay a 
tract closely resembling this lies along the 
shore. It has been much improved by the use 
of marl, bone dust, and guano, and forms the 
chief tobacco-growing region of the state. 
Some of the valleys of the interior and norther-
n counties are extremely fertile. The com-
monest forest trees are the oak, hickory, 
chestnut, pine, locust, walnut, cedar, gum, and 
beach. Tobacco, wheat, and Indian corn are 
the staple cultivated crops. In 1870 Mary-
land was fifth among the states in the produc-
tion of tobacco. Oats, rye, Irish and sweet 
potatoes, hay, milk, butter, wool, &c., are also 
produced. Peaches, strawberries, &c., are ex-
tensively cultivated in the E. part of the state. 
The number of farms in 1870 was 27,000, of 
which 3,114 contained less than 10 acres each, 
1,764 from 10 to 20, 4,825 from 20 to 50, 7,026 
from 50 to 100, 8,914 from 100 to 200, 163 
from 500 to 1,000, and 14,100 acres and over. 
The number of acres of improved farm land 
was 2,914,007; cash value of farms, $176,- 
369,064; of farming implements and machine-
ry, $5,266,876; amount of wages paid during the 
year, including value of board, $5,560, 
367; estimated value of all farm productions, 
including betterments and additions to stock, 
$55,349,927; value of orchard products, $1,319,- 
405; of produce of market gardens, $1,039,- 
782; of forest products, $613,309; of home 
mansufactures, $68,608; of animals slaughtered 
or sold for slaughter, $4,621,418; of live 
stock, $18,483,098. The productions were 1,095 
bushels of spring and 5,773,408 of winter wheat, 
307,080 of rye, 11,701,817 of Indian corn; 3,221,- 
253 of oats, 11,315 of barley, 77,867 of buck-
wheat, 57,556 of peas and beans, 1,682,205 of 
I Irish potatoes, 218,706 of sweet potatoes, 35,- 
040 of clover seed, 2,069 of grass seed, 1,541 
of flax seed, 15,785,359 lbs. of tobacco, 435,- 
218 of wool, 5,614,729 of butter, 6,783 of 
cheese, 2,800 of hops, 30,760 of flax, 70,464 of 
maple sugar, 3,439 of wax, 118,929 of honey, 
11,588 gallons of wine, 1,550,101 of milk sold, 
28,563 of sorghum molasses, 374 of maple mo-
lasses, and 223,119 tons of hay. The live stock 
consisted of 89,696 horses, 9,830 mules and 
asses, 94,794 milk cows, 22,491 working oxen, 
98,074 other cattle, 129,697 sheep, and 257,- 
893 swine. There were also 12,520 horses and 
16,040 cattle not on farms. — The number of 
manufacturing establishments was 5,812, hav-
ing 351 steam engines of 13,651 horse power, 
and 257 water wheels of 18,444 horse power; 
number of hands employed, 44,861, of whom 
34,061 were males above 16, 8,375 females 
above 15, and 2,521 youth; amount of capital 
invested, $56,438,729; wages paid, $12,662,
817; value of materials used, $16,897,022; of 
products, $76,593,013. The following table 
exhibits the number of establishments, with 
the capital and value of products, of the prin-
cipal branches:

MARYLAND

The value of manufactures in 1810 was $8,879,861; in 1840, $13,509,636; in 1850, $33,043,992; in 1860, $41,735,157. Maryland ranks sixth among the states in the value of foreign commerce, which is carried on wholly through Baltimore. The imports for the year ending June 30, 1874, amounted to $29,302,-188; domestic exports, $27,513,111; foreign exports, $179,595. The chief items of export were 76,053,583 lbs. of leaf tobacco, valued at $8,866,405; 6,809,609 bushels of Indian corn, $5,287,444; 412,743 barrels of flour, $3,240,967; 38,065 bales of cotton, $2,669,219; and 13,321,567 lbs. of lard, $1,325,636. There were 1,117 entrances, tonnage 555,599, and 1,026 clearances, tonnage 524,847. The number of entrances in 1873 was 861, with an aggregate tonnage of 997,167, of which 367, of 118,637 American vessels, and 494, of 587,530 tons, foreign; clearances, 853, with an aggregate tonnage of 411,161, of which 321, of 109,490 tons, were American, and 532, of 301,671 tons, foreign. Besides Baltimore, Maryland includes the customs district of Annapolis, the eastern district, and part of the district of Cherrytree, Crisfield being the port of entry of the two last. The following table gives the details of the coastwise trade, with the vessels registered, enrolled, and licensed, for the year ending June 30, 1874, and those built during the previous year:

Of the vessels registered, &c., or belonging in the state, 1,296 with an aggregate tonnage of 67,616 were sailing vessels, 118 of 39,325 tons steamers, and 584 of 35,327 tons unrigged vessels. Those built include 77 sailing vessels of 3,665 tons, 6 steamers of 550 tons, and 21 canal boats of 1,543 tons. The oyster fisheries of Chesapeake bay are of great value, and are the chief source of supply for the markets of the United States. The state maintains several police boats to enforce the regulations governing the fishery, and derives a revenue from licenses to those engaged in it.—The number of miles of railroad in operation in 1844 was 259; in 1854, 327; in 1864, 408. The statistics of the various lines for 1874 are as follows:

The Frederick and Pennsylvania railroad is to be extended to the Pennsylvania line, making the entire length 28 m. The Washington County line is operated by the Baltimore and Ohio company, the Worcester by the Wirconico and Poconos, and the Columbia and Port Deposit by the Philadelphia and Baltimore Central. The Southern Maryland railroad is in progress from Washington to Point Lookout, at the entrance of the Potomac into Chesapeake bay, 75 m. The Chesapeake and Ohio canal follows the valley of the Potomac from Cumberland to Georgetown, D. C., 1843 m., thence across the Potomac by an aqueduct to Alexandria, Va. A portion of the Susquehanna and Tidewater canal, from Wrightsville, Pa., on the Susquehanna river, opposite Columbia, to Havre de Grace, 45 m., is within this state; and also a portion of the Chesapeake and Delaware ship canal, which connects the waters of Chesapeake and Delaware bays.

—The number of national banks in operation in the state in 1873 was 33, having an aggregate capital of $13,640,203; state banks, 10, with $2,918,013 capital; savings banks, 7, with deposits to the amount of about $12,000,000. There were 17 fire and marine insurance companies chartered by the state, having an aggregate capital of $2,851,568; assets, $4,967,878; liabilities, $1,048,797. There were 71 companies of other states and 10 foreign companies doing business in Maryland. There were 2 home life insurance companies, with $200,000 capital, $864,394 assets, and $601,770 liabilities; and 38 companies of other states doing business in Maryland.—The constitution vests the executive power in a governor, who is assisted by a secretary of state, attorney general, comptroller, treasurer, state librarian, and commissioner of the land office. The governor and attorney general are elected by the people for a term of four years, and the comptroller for two years; the treasurer is chosen by joint ballot of the two houses of the legislature for two years; the other officers are appointed by the governor, with the advice and consent of the senate, for four years. The governor must be 30 years of age, for ten years a citizen of the state, and for the last five years a resident thereof. He grants reprieves and pardons except in cases of impeachment, remits fines and forfeitures for offenses against the state, and has a veto upon the acts of the legislature, which may be overthrown by a three-fifths vote of both houses. He enters upon his office on the first Monday of January after his election, and has a salary of $4,500. In case of his death, resignation, or disqualification, the legislature elects a governor for the residue of the term. If that body is not in session, the president of the senate, or in default of that officer the speaker of the house of delegates, until a new governor is chosen. The governor, comptroller, and treasurer constitute the board of public works. The legislative power is vested in a general assembly, consisting of a senate and house of delegates. The senators, 26 in number (one from each county and one from each of the three legislative districts of the city of Baltimore), are elected for four years, one half retiring biennially. The delegates (present number 85) are elected for two years, and are apportioned among the counties after each census according to population. Senators must have attained the age of 25 years. The legislature meets biennially on the first Wednesday in January in even years. Regular sessions are restricted to 90 days, but the governor may call special sessions, which shall not exceed 30 days. Members receive $3 a day during the session, and the presiding officers $8, besides mileage. The house possesses the power of impeachment; the senate constitutes the court for the trial, two thirds being necessary for a conviction. The court of appeals has appellate jurisdiction only, and consists of the chief judges of the first seven circuits, besides a judge specially elected by the electors of Baltimore city. The state is divided into eight judicial circuits, the city of Baltimore constituting the eighth. In each circuit, except the eighth, a chief judge and two associate judges are elected, and in each county a circuit court is held, having general original jurisdiction both civil and criminal, and appellate jurisdiction of judgments of justices of the peace. In the city of Baltimore there are five courts, viz.: the superior court of Baltimore city, the court of common pleas, and the Baltimore city court, having concurrent original jurisdiction in all civil common law cases (the city court having in addition exclusive jurisdiction of appeals from judgments of justices of the peace, and the common pleas exclusive jurisdiction in matters of insolvency); the circuit court of Baltimore city, with exclusive original jurisdiction in equity; and the criminal court of Baltimore, with general original jurisdiction of crimes. A chief judge and four associate judges constitute the supreme bench of Baltimore, designing one or more of their number to hold the above described courts, and any three or more to hold general terms with certain appellate powers. Judges are elected by the voters of the respective circuits for a term of 15 years, and cannot hold office beyond the age of 70. Three judges of the orphans' court are elected in each county and the city of Baltimore for a term of four years. Justices of the peace are appointed by the governor, with the advice and consent of the senate, for the term of two years, and have jurisdiction of most civil cases, not involving the title to land, in which the amount in dispute does not exceed $100. Under the constitution every white male citizen of the United States, of sound mind and not a convict, 21 years of age and upward, who has resided for a year in the state and six months in the county or legislative district, may vote in the ward or election district in which he resides. Under the provisions of the
15th amendment to the constitution of the United States, colored citizens are entitled to vote. No one who engages in or aids or abets a duel, or sends or accepts a challenge, nor any defaulter in public funds, can hold office; and no minister of the gospel or person holding any civil office of profit or trust under the state or United States, except that of justice of the peace, is eligible to the legislature. The legislature is prohibited from lending the credit of the state to any individual, association, or corporation, and restrictions are placed upon the power of special legislation, of contracting a public debt, and of pledging the faith or credit of the state for the construction of internal improvements. Amendments to the constitution must be proposed by three fifths of each house of the legislature and ratified by the people. Every 20 years the people are to vote on the question of holding a convention to revise the constitution. Murder in the first degree is punished with death; arson, rape, and treason, with death or imprisonment for a term of years, in the discretion of the court; other crimes are punished by fines and imprisonment. The chief grounds of divorce are adultery, abandonment for three years, impotency at the time of marriage, and illicit intercourse of the wife before marriage, unknown to the husband. A separation from bed and board may be had on the ground of cruel treatment, excessively vicious conduct, or desertion. A married woman may acquire, hold, and manage separate property free from liability for the debts of her husband; she may dispose of it by will as though single, but her husband must join with her in any deed. The rate of interest is 6 per cent. Maryland has two senators and is entitled to six representatives in congress, and has therefore eight votes in the electoral college. The valuation of property, according to the United States census, has been as follows:

The taxation national in 1870 was $6,692,842, of which $1,781,292 was state, $1,542,218 county, and $3,309,732 town, city, &c. The total debt amounted to $29,032,577, of which $13,517,475 (bonded) was state, $1,565,779 ($1,305,385 bonded) county, and $14,149,313 ($14,097,856 bonded) town, city, &c. The amount given as state debt includes liabilities incurred in aid of railroads, canals, &c. The sinking fund amounted to $1,794,450. According to the report of the controller for the year ending Sept. 30, 1873, the receipts into the state treasury, including a balance of $339,171 10 on hand at the beginning of the year, were $2,771,848 58, of which $1,814,348 96 was from ordinary sources, viz.: $298,955 61 from dividends and interest paid by banks and railroad and canal companies, $875,664 81 from taxes on property, $4,605 27 from taxes on state and other stocks, $77,868 47 from taxes on incorporated institutions, $540,263 53 from licenses on trades and occupations, marriages, the oyster fishery, &c., $15,183 36 from fees, $14,349 13 from fines and forfeitures, $7,629 73 from grain inspections, $15,403 97 from tobacco inspections and warehouses, $9,777 94 from state livestock scales, $2,559 41 from state wharves, $2,332 01 from the land office, $65,196 58 from taxes on commissions of executors and administrators, $39,817 61 from taxes on collateral inheritances, $4,773 50 from taxes on protests, and the rest miscellaneous. The disbursements were $2,257,038 36, leaving a balance at the close of the year of $484,810 22; besides which there was $14,329 08 in the treasury to the credit of the school fund, and $66,579 28 to the credit of the sinking fund. Deducting $453,296 02 paid in redemption of the debt, and $152,500 to meet the state's subscription to stock of railroad companies in Charles and St. Mary's counties, the ordinary expenditures amounted to $1,681,242 34, viz.: $15,000 for the blind asylum, $16,800 for bounty to volunteers, $25,406 67 for salaries of civil officers, $77,961 92 for colleges and academies, $49,904 91 for colored schools, $30,000 for the deaf and dumb asylum, $10,000 for the colored deaf and dumb and blind asylum, $50,000 for various charitable and reformatory institutions, $701,909 29 for interest on the public debt, $88,802 78 for salaries of judicial officers, $2,500 for the Maryland infantry asylum, $14,500 for the state penitentiary, $23,818 72 for the military, $42,290 for pensions, $88,566 97 for public schools, $9,500 for the state normal school, $2,000 for the colored state normal school, and the rest miscellaneous. The assessed value of property was $424,672,712, and the tax, 17 cents (10 cents for public schools) on $100, amounted to $721,994 17. The assets of the state on Sept. 30, 1873, were represented by productive stock and bonds of railroad and other companies to the amount of $4,455,464 18; amount due from incorporated institutions, tax collectors and other officers, $1,026,701 96; unproductive stock and bonds and accrued interest, $21,608,694 51; total, $28,059,860 65. More than $20,000,000 of the unproductive assets consist of stock and bonds of and interest due from the Chesapeake and Ohio canal company, which it is believed, at a not very distant period, will make some return to the state. The funded debt at the above date amounted to $10,741,215 00. Deducting the sinking fund and the productive stock and bonds, the net debt was $8,210,172 14. The free school fund, including the fund for the indigent blind ($10,770 47), amounted to $914,016 58, invested in stocks and bonds, except $14,220 08.
cash in the treasury. The balance to the credit of the oyster fund was $272,014.4; receipts during the year, $65,490.55; expenditures, $24,470.75; both included in the receipts and expenditures given above.—The state institutions are the penitentiary, the institution for the instruction of the blind, and that for the colored blind and deaf mutes, in Baltimore; the hospital for the insane, at Spring Grove, near Catonsville, Baltimore co.; and the institution for the education of the deaf and dumb, at Frederick. The penitentiary is under the management of a board of six directors, with six officers in immediate charge. The number of convicts in prison during the year ending Nov. 30, 1873, was 824, of whom 226 were received during the year; remaining at its close, 614, viz.: white males, 211; white females, 6; colored males, 361; colored females, 36. The convicts are employed in the prison, but the labor of the greater part is let to contractors, who manufacture shoes, harnesses, clothing, coperage, marble work, &c. The earnings in 1873 amounted to $71,104.50, producing a surplus of more than $3,000 over the expenditures. The hospital for the insane was established in Baltimore in 1828. In 1852 the legislature provided for the erection of the present building, which remaining uncompleted and encumbered with a heavy debt in 1870, the old hospital was sold, and the proceeds, with an appropriation of $330,000 from the state treasury, devoted to its completion. The patients were removed to it in 1872. It is capable of accommodating 300. The institution is under the management of a president and board of visitors, with four resident officers. The number of inmates during 1873 was 298; remaining at the close of the year, 127, of whom 70 were males and 57 females, 57 private and 70 public patients; 102 were chronic cases, 13 acute mania, 9 epileptic, and 3 mania a potu. Aside from such appropriations as the legislature may make, the income is derived from the receipts from the county for pauper patients and from private patients. The institution for the instruction of the blind was opened in 1854. The number of pupils under instruction during the year ending Dec. 1, 1873, was 55; remaining at that date, 47, of whom 7 were from the District of Columbia and supported by the United States; number of officers and instructors, 10. Besides reading, &c., the boys receive instruction in piano tuning and broom making, and the girls in sewing, knitting, &c. The age of admission is between 9 and 18 years, and pupils may be educated at the expense of the state, upon the recommendation of the governor. The institution for the education of the deaf and dumb was established in 1868, and was accommodated in barracks until the completion of the centre and south wing of the new building in the beginning of 1873. The number remaining uncompleted in 1874. The number of pupils under instruction in 1873 was 90 (62 males and 37 females); remaining at the close of the year, 87; number of officers and instructors, 18; volumes in the library, 2,000. Instruction is given in articulation and lip reading, and in shoemaking, as well as in the common branches of learning by the ordinary methods. The age of admission is from 9 to 21 years, and pupils may be educated at the public expense upon the certificate of the orphans' court or commissioners of the county in which they reside. The institution for the colored blind and deaf mutes was established in 1872, and in 1874 had 5 officers and instructors and 23 pupils, of whom 10 were deaf mutes and 13 blind. The house of refuge for juvenile delinquents, near Baltimore, was opened in 1855. The boys receive instruction in the rudiments of learning and in various industries. A "house of merit" is connected with it, in which the younger and less vicious are separately classified. The institution is mainly supported by state and city appropriations. The number of inmates during 1873 was 411; remaining at the close of the year, 301. An act of 1874 provides for the establishment of a house of correction for convicts sentenced for not less than three months nor more than three years.—The constitution requires the general assembly to establish a system of free public schools, and to provide for its maintenance by taxation or otherwise. The act of 1872 constitutes a state board of education, a board of county school commissioners for each county, and a board of district school trustees for each school district, to have general control of the public schools in their respective jurisdictions. The state board consists of the principal of the state normal school ex officio, together with four persons appointed for two years by the governor, with the consent of the senate, from among the president and examiners of the county boards, one of whom must be a resident of the eastern shore. The county boards consist of three or five members, and are appointed for two years by the judges of the circuit courts. They elect a person, not of their number, to act as secretary, treasurer, and examiner, and an assistant examiner in the larger counties when necessary. The schools are free to all white youth between the ages of 6 and 21 years, and at least one is directed to be kept open in each district for ten months in the year. The teachers must be graduates of the normal school, or have a certificate of competency from the county examiner or the state board. Teachers' institutes are required to be held once a year for five days in each county, under the direction of the county examiner and the principal or a professor of the normal school. The act empowers the mayor and council of the city of Baltimore to establish a system of free public schools, and to appoint a board of commissioners of public schools for that city. Separate free schools are established in each election district for colored children between the ages of 6 and 20 years, for the support of which are set apart such sums
as may be appropriated by the state or given by individuals for that purpose, together with the taxes paid by the colored people for school purposes. According to the report of the state board for the year ending Sept. 30, 1873, the number of public schools in operation was 1,742, including 225 for colored children; number of different pupils, 130,324 (14,171 colored); highest number enrolled in one term, 99,258; average daily attendance, 60,817; number of teachers, 2,555; average length of schools, 9 months and 13 days; amount paid for teachers' salaries, $889,476 47; for building, repairing, and furnishing school houses, $197,387 10; for books and stationery, $69,577 18; total expenditures for school purposes, $1,355,066 71, defrayed partly by a state tax of 10 cents on $100, partly by the income of the school fund, and partly by local taxation. The schools of the city of Baltimore included one college or male high school, two female high schools, and 40 grammar schools (one colored). A few high and grammar schools have been established in other parts of the state; but the public schools are mostly elementary. The Baltimore city college had 10 instructors; number of different pupils during the year, 470; average attendance, 282. The state normal school for the training of teachers was established in Baltimore by the school law of 1865, and its continued existence has been provided for by subsequent acts; 200 pupils are entitled to be admitted free on the recommendation of the county or city school commissioners, upon declaring their intention to engage in teaching in the state, and others may be received upon the payment of tuition. The number of instructors in 1873 was 9; of pupils, 146, of whom 13 were males and 133 females; volumes in the library, 1,200. A model school is connected with it. The Howard normal school (colored), at Baltimore, was organized in 1865. It receives a small appropriation from the state, but is supported mainly by donations. The number of pupils in 1873 in all departments (primary, grammar, and normal) was 234; average attendance, 186. The number in the normal department was 74; volumes in the library, 1,000. The number of academies receiving state aid was 22, with 50 teachers and 1,257 pupils. According to the United States census of 1870, the number of schools of all kinds was 1,779, having 1,498 male and 1,759 female teachers, 55,800 male and 51,584 female pupils; income from endowment, $21,697; from taxation and public funds, $1,134,347; from other sources, including tuition, $842,171; total, $1,998,215. Of these, 1,487 (3 normal, 10 high, 49 grammar, 159 graded common, and 1,266 ungraded common) were public, with 2,150 teachers, 83,226 pupils, and an income of $1,146,087, of which $1,039,135 was derived from taxation and public funds. Of the 350 state public, 55 were classical (17 colleges and 34 academies), 7 professional (1 law, 2 medical, 4 theological), 12 technical (1 agricultural, 3 commercial, 1 for the blind, 1 for the deaf and dumb, 6 of art and music), 158 day and boarding, and 67 parochial and charity. The statistics of the principal colleges for 1873-4 are exhibited in the following table:

These institutions, besides courses of collegiate grade, have preparatory departments, which embrace a large portion of the students. Mount St. Mary's college has a theological department, with 34 students not embraced in the number given in the table. St. Charles's college is regarded as a preparatory institution to the theological seminary of St. Sulpice and St. Mary's university at Baltimore (which in 1873-4 had 6 professors and 60 students), and is designed only for those who are intended for the church. The Western Maryland college has a three years' course for females, with an attendance of 61 students included in the number given in the table, and gives special instruction to young men intended for the ministry. The college of St. James since the civil war has had only a high school or preparatory department in operation. Woodstock college is devoted exclusively to the education of the younger members of the society of Jesus, and embraces a three years' course of philosophy and a four years' course of theology; 42 of the students in 1873-4 were pursuing the former course and 60 the latter. Six state scholarships have been established in St. John's college for each senatorial district, exempting the holder from payment of room rent and tuition fees, and
in 1872 the legislature provided for furnishing board to two of the incumbents from each district, who after receiving the advantages of the college for four years are required to teach school within the state for not less than two years. Several state scholarships have also been established in the Frederick, Washington, and Western Maryland colleges. The collegiate department of the agricultural college embraces a four years' course of arts, including agriculture and ordinary scientific and English studies, with classics and modern languages, and a three years' course of science, which is the same as the preceding, with the omission of classics. Provision is also made for such as desire to remain but one year in the institution. The college received the proceeds ($110,000) of the 210,000 acres of land granted to the state by congress for the establishment of a college of agriculture and the mechanic arts. A farm of 300 acres is connected with it. Tuition is free; and in accordance with an act of the legislature 12 students from each congressional district receive the use of textbooks free. The medical department of Washington University was established in Baltimore in 1833; a hospital and free dispensary are connected with it; in 1874 it had 11 professors and 313 alumni; the number of students in 1872-3 was 192. The medical department of the university of Maryland in Baltimore was established in 1807; in 1873-4 it had 12 professors, 114 students, and a library of 3,500 volumes. The Maryland college of pharmacy in Baltimore was established in 1841, and in 1873-4 had 4 professors and 54 students; the degree of graduate in pharmacy is conferred after examination upon persons who have attained the age of 21 years, have served an apprenticeship of four years with some reputable pharmacist, and have attended two courses of lectures in a recognized college of pharmacy, the last course in this institution; any graduate of good standing, on passing a prescribed examination, is entitled to the degree of master in pharmacy. The Baltimore college of dental surgery, the oldest dental college in the world, was incorporated in 1840; in 1874 it had 9 professors and 578 alumni; the number graduating that year was 19; the number of students in 1872-3 was 50. Candidates for graduation are required to prepare a written thesis, to pass an examination upon the subjects taught in the college, and to have attended two courses of lectures in the institution; but an equivalent for one course is allowed. The Maryland dental college was established in Baltimore in 1873, with 19 professors. The United States naval academy is situated at Annapolis. (See Annapolis.)—According to the census of 1870, the number of libraries was 3,353, containing 1,713,483 volumes, of which 2,037, with 1,142,538 volumes, were private. Of those not private, 2, with 31,462 volumes, were state libraries; 1, with 41,500 volumes, city; 29, with 14,662 volumes, court and law; 72, with 98,470 volumes, school, college, &c.; 88, with 215,763 volumes, Sabbath school; and 310, with 90,989 volumes, church. There were 88 newspapers and periodicals, issuing 33,497,778 copies annually, and having a circulation of 285,450, viz.: 8 daily, circulation 82,921; 1 tri-weekly, 5,015; 2 semi-weekly, 1,600; 69 weekly, 127,314; and 8 monthly, 18,600. They were classified as follows: agricultural and horticultural, 2; commercial and financial, 2; illustrated, literary, and miscellaneous, 7; political, 70; religious, 6; technical and professional, 1. The number of church organizations was 1,420, with edifices, settings, and property as shown in the following table:

—The first settlement in Maryland was made by Capt. William Clayborne with a party of men from Virginia on Kent island, Chesapeake bay, in 1631. But the charter under which the colony was permanently established was granted to Cecilius Calvert, second Lord Baltimore, by Charles I., and was dated June 20, 1632. The province covered by this grant had been partially explored by Sir George Calvert, father of the grantees, four years before. The name first intended for the colony was Calvertia, but in the charter it was styled Terra Maria, “Mary’s Land,” in honor of Queen Henrietta Maria. The expedition designed to commence the settlement sailed from the Isle of Wight Nov. 22, 1633, in two vessels named the Ark and the Dove. The emigrants numbered 200, and were nearly all Roman Catholics and gentlemen of fortune and respectability. On March 27, 1634, they commenced a settlement at St. Mary’s, near the entrance of the Potomac into Chesapeake bay, within the present limits of St. Mary’s co. Leonard Calvert, brother of the lord proprietary, who had conducted the colony from England, became its first governor. A year or two after landing he turned his attention toward Clayborne’s settlement; but Clayborne refused to acknowledge himself subject to the new government, and was at length expelled along with his
most active adherents. Under the charter
Lord Baltimore had the power of enacting all
necessary laws, with "the advice, consent, and
approbation of the freemen of the province," or
their representatives convened in general
assembly. The first assembly met in the be-
ginning of 1635, and submitted certain laws to
the approval of the proprietary. A dispute
thereupon arose respecting the right of initia-
tive in legislation, which was settled in 1638
by Lord Baltimore's yielding the right to the
assembly. (See Calvert.) In the following
year the first statutes of Maryland were enact-
ed. In 1642 a company of Puritans, who had
been expelled from Virginia for nonconform-
ity, settled in Maryland, and soon began to
manifest a spirit of resistance to the authority
of the proprietary. Clayborne also had re-
turned from his exile and regained possession
of Kent island. The efforts of the governor
to dispossess him not only failed, but Clayborne
and his partisans, with the Puritan party, made
themselves complete masters of the province,
and compelled the governor in his turn to fly
into Virginia. This event occurred in 1645.
In 1647 the governor returned at the head of a
military force and recovered possession. In
1649 the assembly passed an act by which
Christians of all sects were secured in the pub-
lic profession of their faith, and allowed to
worship God according to the dictates of their
own consciences. The Puritans, whose arrival
in the colony has already been noticed, settled
at Providence, which at a later period received
the name of Annapolis and became the seat of
government. They still proved turbulent, and
as a means of conciliating them their settle-
ment was erected in 1650 into a separate coun-
ty under the name of Anne Arundel; and
still additional members of this denomination
arriving from England, Charles county was or-
ganized for them a short time afterward. From
this time they began to exercise a controlling
influence in public affairs. On the overthrow
of the royal government and the establishment
of the commonwealth in England, their party
insisted upon an immediate recognition of the
new order of things; but the authorities pro-
ceeded to proclaim Charles II. In the next
assembly it was found that the Puritans had a
majority; and in 1652 commissioners from
England visited Maryland, with whom were
associated Clayborne, the old opponent of the
proprietary government, and Bennett, the lead-
er of the Puritans of Anne Arundel county.
They removed Gov. Stone, who was subse-
quently reinstated by them, and completely es-
tablised the authority of the commonwealth.
Kent island was once more delivered up to Clay-
borne and he acquired also Palmer island at the
mouth of the Susquehanna. In 1654 Lord
Baltimore made a determined effort to regain
possession of the province, and directed Gov.
Stone to require all persons to take the oath of
fidelity, and to reestablish the proprietary
government; but Bennett and Clayborne, the
former of whom was now governor of Vir-
ginia, again interfered, and reversed all that
Lord Baltimore had accomplished. They es-
ablished a commission for the government of
the colony, and placed Capt. Fuller at its head.
Hereupon a civil contest ensued, and hostilities
were carried on by land and water. Providence
was attacked by the proprietary party, but the
Puritans were victorious, and killed or captured
the whole invading force. Many of the capti-
vates, among whom was Gov. Stone, were con-
demned to death, and at least four of them
were executed. This decisive action was fought
March 25, 1655. Three years later the power
of the proprietary was completely restored.
In 1662 the Hon. Charles Calvert, son of the
lord proprietary, was appointed governor, and
so continued till 1676, when on the death of his
father he succeeded to his rights, and appointed
Thomas Notely his representative. After the
revolution of 1666 the government was assumed
by King William, and in 1667 Sir Leonard Cal-
voy was sent over as governor. Among the first acts
of importance under the new government was the
removal of the capital from St. Mary's to
Providence, thenceforth known as Annapolis.
In 1714 Benedict Leonard Calvert succeeded
on the death of his father to his hereditary
rights, and dying the following year was suc-
ceded by his son Charles, a Protestant. The
principal obstacle to the recognition of the
claim of this family being thus removed, the
authority of the proprietary was restored
throughout the colony after a suspension of 24
years. Hart, the last of the royal governors,
was continued in office. In January, 1730,
Baltimore was laid out. In 1745 the "Mary-
land Gazette," the first newspaper printed in
Maryland, was established at Annapolis, and
continued to be issued by the descendants of
Thomas Green, its founder, until 1839. Fred-
erick City was founded in 1745, and was so
named after the son and successor of the then
proprietary. Georgetown, now in the District
of Columbia, was laid out in 1731, and, being
at the head of the navigation of the Poto-
mac, grew rapidly in population and trade.
The policy of the English government was to
repress all efforts to establish manufactures;
but in 1742 copper works were in operation,
and in 1749 eight furnaces and nine forges;
and wine was produced to a considerable ex-
tent. The great staple export, however, was
tobacco, of which 30,000 hogheads were ex-
ported annually, and for many purposes toba-
cco was the currency of the province. In 1732
it was made a legal tender at one penny a
pound. Almost from the date of the founda-
tion of the colony disputes with the neighbor-
ling provinces regarding boundaries had been a
serious cause of disquiet. The boundary with
Virginia on the eastern shore was adjusted in
1668 by the running of the "Calvert and Scar-
brough" line. That on the side of Delaware
and Pennsylvania was not finally settled till
1760, when commissioners were appointed to

run the lines. The Pennsylvania boundary is known as "Mason and Dixon's line," from the names of the surveyors who located it. (See Mason and Dixon's Line.) The W. boundary was surveyed in 1859 by commissioners appointed by Maryland and Virginia. The line along the Potomac remains still formally unadjusted, Maryland claiming the S. branch, and West Virginia the N. branch, while in the main stream Virginia claims the N. bank and Maryland the S. bank as the boundary. This dispute involves valuable riparian rights, and in Chesapeake bay productive oyster fisheries. In the long and bloody contest which annihilated the French dominion in America, Maryland bore an active part. Until the capture of Fort Duquesne in 1758, the western parts of the colony were kept in constant terror, and large numbers sought refuge in Baltimore and other coast towns. The stamp act and the tea duty act were alike opposed by the people of Maryland, and in December, 1774, the proprietary government was practically superseded by a convention of the people. Another convention assembled in August, 1776, and in September presented a bill of rights and a constitution, which were adopted in November. The first elected legislature assembled at Annapolis, Feb. 5, 1777, and on the 13th Thomas Johnson was chosen the first republican governor. Throughout the war the Maryland troops were remarkably efficient, and under the title of the "Maryland line" took a high position in the continental army. In 1783 congress met at Annapolis, and here on Dec. 23 Washington resigned his commission. The federal constitution was adopted in the Maryland convention by a vote of 63 to 11, on April 28, 1788. During the war of 1812, Admiral Cockburn, the British naval officer, committed a series of depredations on the shores of Chesapeake bay, and plundered and burned Frenchtown, Havre de Grace, Fredericktown, and Georgetown. The Maryland militia opposed the march of the British to Washington in 1814, but without effect. On Sept. 12 of the same year was fought the battle of North Point, in which the British general Ross was killed, and the Americans gained a slight advantage; and on the next day the invaders began an attack upon Baltimore by the bombardment of Fort McHenry. The defence was bravely conducted, and on the 16th the British fleet weighed anchor and made sail down the bay. The Baltimore and Ohio railroad was commenced in 1828, and completed to the Point of Rocks on the Potomac in 1832, but it was not opened to Wheeling till 1853. The Chesapeake and Ohio canal was undertaken by a company formed in 1828, and was completed in 1850. In 1829 and 1810 the constitution was amended, and in 1850 it was essentially remodelled. In 1845-6 it was again amended, and in 1851 a new constitution was adopted. At the beginning of the civil war many citizens of Maryland favored secession, and many subsequently entered the confederate army. The first hostile demonstration was the attack on the sixth Massachusetts regiment in Baltimore, April 19, 1861. (See Baltimore.) The legislature, which met at Frederick on the 26th in pursuance of a proclamation of the governor, refused to pass an ordinance of secession, but took various measures looking to neutrality, and passed resolutions assenting to the independence of the confederate states and opposing the war. At the election which took place in November the Union candidate for governor was elected by a majority of 31,412 in a total vote of 53,654, and a legislature almost unanimously in favor of the Union was chosen. Henceforth the state authorities were active in support of the war, and 49,730 men were contributed by Maryland to the federal armies. In September, 1862, the battle of Antietam, the principal engagement that took place in Maryland, was fought, and in June, 1863, the state was invaded by Lee in his advance into Pennsylvania. Another invasion, under Gen. Early, took place in July, 1864, and a battle was fought on the Monocacy river (July 9). In October, 1864, a new constitution was ratified by the people by a vote of 30,174 to 29,799, which abolished slavery and disfranchised all who had aided or encouraged rebellion against the United States. The present constitution was adopted at an election held on Sept. 18, 1867.

MARY OF BURGUNDY. See Maximilian I.

MARY OF THE INCARNATION (MARIE GUYARD), an Ursuline nun, called the St. Theresa of New France, born in Tours, France, Oct. 18, 1599, died in Quebec, April 30, 1672. By the will of her father she married at 17 M. Martin, a silk manufacturer. Having been left a widow at 19, she superintended a factory till her son was 12 years of age, and then, on Jan. 25, 1631, entered an Ursuline convent. She went to Canada in 1639, and founded the Ursuline convent in Quebec. She acquired the Huron and Algonquin languages, taught French and Indian pupils, and evinced great judgment and ability in directing her community and in aiding the rising colony. She was one of the first to call the attention of the French government to the vital importance of securing the mouth of the Hudson from the Dutch, if France desired to hold Canada. Her letters, which form a valuable body of contemporaneous information, and are esteemed in a religious point of view, were published in 1861. Her life has been written by her son, the Benedictine Dom Claude Martin (Paris, 1677), by Father Charlevoix (Paris, 1724), and by the abbé Casgrain (Quebec, 1864).

MARY MAGDALENE (probably so called from Magdala, a tower of Galilee, a woman mentioned by St. Luke (xvii. 3)), "Mary called Magdalene, out of whom went seven devils," among those who accompanied Jesus and "ministered unto him of their substance" (viii. 3). She is commonly supposed to be the same as the "woman, which was a sinner," of whom
St. Luke previously relates (vii. 37, 38) that as Jesus sat at meat in the house of Simon the Pharisee she washed his feet with tears and wiped them with the hairs of her head, and anointed them; but there is no evidence of their identity. The supposition has also been entertained that she is identical with Mary the sister of Martha and Lazarus; but beyond the similarity of name, the affectionate devotion to Jesus Christ which distinguished both, the fact that the sister of Martha also anointed the feet of Jesus, and the opinion of some of the early fathers, among whom is St. Gregory the Great, no foundation for it has been assigned. Origen discusses the opinion fully, and rejects it. Mary Magdalenæ stood by Jesus on the cross, and was present when Joseph of Arimathea laid him in the sepulchre. On the first day of the week she came early to the tomb, and finding it open ran and told Peter and John that they had "taken away the Lord out of the sepulchre" (John xx. 2). Returning to the place with these apostles she saw "two angels in white sitting, the one at the head, and the other at the feet, where the body of Jesus had lain" (xx. 12). Immediately afterward Christ himself appeared to her, and announced his approaching ascension. Of her subsequent life nothing is known, but it is the theme of numerous legends. The tradition that she passed the latter part of her life in penitential exercises in the desert was treated by Guido, Correggio, Canova, and many other great masters.

MARY STUART, queen of Scots, born in the palace of Linlithgow in December, 1542, beheaded at Fotheringay castle, Northamptonshire, England, Feb. 8, 1587. The precise date of her birth is unknown, for though it is commonly stated Dec. 8, there seems reason to believe that the event must have occurred on the 11th or 12th of that month; and it was probably antedated on account of the 8th being one of the four great festivals of the Catholic church in honor of the Virgin. She was the daughter of James V., seventh king of the Stuart line, and of Mary of Lorraine, daughter of Claude, duke of Guise, the founder of that family which had so conspicuously a part in the politics of France in the 16th century. Her birth took place at one of the dreariest periods of Scottish history, her father dying when she was but a few days old (Dec. 13), of mortification consequent on the defeats which the Scotch had voluntarily met with from the English at Fala Mair and Solway Moss, the nobles being opposed to his policy. The earl of Arran, head of the house of Hamilton, and heir presumptive to the throne, was made regent by the parliament. Mary was crowned Sept. 9, 1543. The first two years of her life were spent at Linlithgow, and she was then removed to Stirling. Henry VIII. of England demanded her hand for his son, the prince of Wales, afterward Edward VI. At first he was successful, and a treaty was made, July 1, 1543, providing that Mary should be sent to England when she should have attained the age of 10 years, and that she should marry Edward as soon thereafter as possible. In five months this treaty was broken, the French and Catholic party triumphing over the English and Protestant party. An alliance was made with France, Dec. 15, and Henry declared war against Scotland, which his troops invaded. After his death as protector Somerset continued his policy, and defeated the Scotch in the battle of Pinkie, Sept. 10, 1547. Meanwhile the queen had lived at Stirling castle, with her governors, Lords Erskine and Livingston; but after the battle of Pinkie she was taken to the monastery of Inchmahome, on an island in Lake Menteith. Her mother and the regent Arran betrothed her to the dauphin of France, son of Henry II., and she sailed to that country from Dumbarton in July, 1548, and arrived at Brest Aug. 14. She was accompanied by four young ladies, Mary Livingston, Mary Erskine, and Agnes Seaton, who were called "the four Marys." She was warmly received by Henry II., who treated her as a daughter. The French court was brilliant, learned, and licentious. Mary's Latin master was George Buchanan, one of the first scholars of the 16th century; and Ronsard taught her poetry. At 18 she pronounced a Latin oration which was much applauded. In 1551 her hand was formally demanded of Henry II. for Edward VI., but she herself refused to listen to the demand. The widespread dominion and power of the Spanish branch of the house of Austria having increased the fear of the house of Valois, Henry II. determined to complete his alliance with Scotland, and the dauphin Francis and Mary were married, April 24, 1558. The open conditions of the marriage were honorable to Scotland; but there were two secret acts of grave moment. By the first Mary gave Scotland to the sovereigns of France, in reward for the services which Henry II. and his predecessors had rendered that country against the English; and by the second she provided against the non-execution of the first. She also conveyed to Henry any claims that might accrue to her upon England and Ireland. Henry was to have the usufruct of Scotland until he should have repaid himself for what he had expended in her defence. These debts had never been accepted by Scotland. Mary had secretly protested in advance against the engagements she had entered into with her own subjects, and declared her wish to annex Scotland to England. The Scotch bestowed the crown matrimonial on Francis, and it was provided that all acts should be published in the name of Francis and Mary, king and queen of Scotland, dauphin and dauphiness of Vienne. When Mary, as queen of England at the age of 15, died at Vienne, 1558, Henry II. caused the dauphin to quarter the arms of England with those of Scotland, as he affected to believe that Mary Stuart was
legitimate heir to the English crown, as descended from Margaret Tudor, eldest daughter of Henry VII., Elizabeth, daughter of Henry VIII. by Anne Boleyn, having been declared illegitimate. This act was the cause of most of the trouble that afterward befell the Scottish queen. Henry II. dying July 10, 1559, Mary was queen of France from that date till the death of her husband, Francis II., Dec. 5, 1560. During his short reign the Guises, who led the Catholic party, ruled the king through their influence over his wife, their kinswoman. Suits for her hand soon appeared—the kings of Sweden and Denmark, and Philip II. of Spain, who wished her to wed his son and heir Don Carlos. She was coldly treated in France, where Catharine de' Medici, never her friend, had control of the government; and she resolved to return to Scotland. In that country the French Catholic party had been overthrown and the English Protestant party had triumphed, aided by Elizabeth's forces. By the treaty of Edinburgh, July 5 and 6, 1560, it was provided, among other things, that the French should leave Scotland, and that the Scotch sovereigns should cease to bear the arms and title of the sovereigns of England. Mary had eluded the ratification of this treaty. When she resolved to return to Scotland, she applied to Elizabeth for a safe-conduct through England, but it was refused, unless she would ratify the treaty of Edinburgh. Mary then embarked at Calais, Aug. 14, 1561, and arrived at Leith on the 19th, escaping the English cruisers. She left France with bitter regrets, and was herself much regretted there. Poets expressed the common feeling, and her own danson bidding adieu to the country is universally known. On her arrival in Scotland, she found the power in the hands of the Protestants, and submitted to what it was impossible to resist. Her chief ministers were her natural brother, the lord James Stuart, and Maitland of Lethington, who were among the ablest statesmen of the century. She expressed herself favorable to toleration, and asked it for herself, but obtained it with difficulty. Her position was one of great embarrassment. Sincerely Catholic, she was the sovereign of a people who had accepted the reformation, and who had displayed the utmost enmity to the old faith. Her joyous modes of life were regarded with abhorrence by most of her subjects, and prepared them to believe the worst that could be alleged against her. Still her reign for some time was prosperous. Her brother, who was at that time attached to her, counselled her wisely and acted vigorously. The rebellious Gordons were conquered. A good understanding with Elizabeth was effected, and preparations for a meeting of the two queens were partially made. Circumstances made it advisable that Mary should marry. Elizabeth wished her to marry the earl of Arran, but to this Mary would not consent. She desired to become the wife of Don Carlos of Spain, and refused the dukes of Ne-
and as she was supported by the French and Spanish ambassadors, the English queen had to abate her pretensions. Murray was desirous of pardon, and appears to have been sincerely anxious to return to his allegiance; but Mary was resolved on his destruction, and on that of most of his associates. She was now much under the influence of David Rizzio, one of those clever Italian adventurers who then swarmed over Europe, and who filled every kind of employment in all countries, from that of the statesman to that of the spy. The queen's love for Darnley was of brief endurance, his worthlessness having soon become apparent. They quarrelled, and Darnley affected to believe he had been dishonored by Rizzio. Darnley wished for the crown matrimonial, meaning an equal share in the royal authority, which Mary had promised him in the days of their attachment. This promise she now refused to keep, and Darnley attributed her decision to Rizzio. She had also joined the league of the Catholic sovereigns of the continent to exterminate Protestantism. Darnley entered into a vast conspiracy, of which the murder of Rizzio was a mere item, but the only one that was successfully executed. His chief abettors were Lord Ruthven, the earl of Morton, chancellor of Scotland, the earl of Lennox, Darnley's father, Lethington, Lord Lindsay, and John Knox. The conspiracy was known to Elizabeth and her ministers. On the evening of March 9, 1566, several of the conspirators entered the room where Mary was supping, with Rizzio and others, in Holyrood palace, and dragged the Italian to the entrance of the presence chamber, on the stairs of which he was slain, receiving 56 wounds. Darnley was one of the most active of those who entered the queen's cabinet; he tore Rizzio from the hold he had on the queen's garments, and held her while his associates despatched the Italian. Mary was for a time the prisoner of the conspirators, but by deceiving Darnley she effected her escape. Murray returned, and while she was reconciled to him and his immediate friends, she pursued the murderers of Rizzio with implacable resentment. Seventy of them, headed by Morton, fled to England; Lennox was banished from the court, and Lethington deprived of his office. She no longer disguised her hatred of Darnley. On June 19 she gave birth to her only child, afterward James VI. of Scotland and James I. of England. At this time her connection with the earl of Bothwell commenced. He was powerful, bold, unscrupulous, and accomplished, and it was natural that Mary should wish to secure his services; but her enemies charge that she entertained a criminal passion for him. Be that as it may, she showed him high favor while she treated her husband more contumeliously than ever. A plan for the destruction of Darnley was formed by Lethington, who wished to gratify the queen by ridding her of her husband, either by divorce or by murder, and to effect the restoration of Morton and his associates. Bothwell joined the conspiracy, as did other great nobles. Murray did not oppose it. It is charged that it was communicated to the queen, and that she offered no serious opposition to it. A bond to cut off the king, and to protect each other, was drawn up and signed by the conspirators. Morton, on his return, was ready to join them if he could have the queen's written warrant, which Bothwell sought to obtain, but unsuccessfully. Darnley was then ill of the smallpox at Glasgow. There he was visited by Mary, and a reconciliation was apparently effected. On his recovering sufficiently to travel he was removed to the provost's house at Kirk of Field, near Edinburgh, where Mary attended him with much apparent kindness, passing several nights under his roof. This house was blown up by gunpowder on the night of Feb. 9, 1567, while the queen was attending a masquerade at Holyrood palace. It is certain that on this murder there is no doubt whatever, but Mary's part in it is not so clear; and the main point in that "Marian controversy" which has continued to the present time turns upon the question of her participation in Bothwell's conspiracy. The impression at Edinburgh was unfavorable to her, and did not lack expression; and her indifference, and her refraining from any exertion to punish those who were loudly accused by the general voice, deepened the belief in her guilt. Instead of complying with Lennox's demand for the arrest of Bothwell, she heaped favors upon the murderer. Public opinion, as pronounced both at home and abroad, compelled her to order that Bothwell should be tried; but his trial was a mockery, the government acting scandalously in his behalf, and he was acquitted. New and signal marks of favor were bestowed upon him, and the whole power of the government was in his hands. He sought to marry the queen, and was divorced from his wife. At a tavern supper, to which he invited many of the nobles and others, he procured, partly by intimidation and partly by falsehood, their signatures to a bond declaring him innocent, and recommending the queen to marry him. On April 24, while returning from Stirling to Edinburgh, she was seized by Bothwell, and conducted to his castle of Dunbar. She was allowed to return to Edinburgh on May 3, when Bothwell's divorce was completed. Her intention to marry him was then announced. He was made duke of Orkney, and on May 15 they were married. This marriage created universal disgust. A conspiracy which had been formed against Bothwell, composed of the chief nobles, now assumed a serious magnitude, and hostilities broke out early in June. The confederates seized Edinburgh, and when the two armies met on Carberry hill, June 15, Mary was deserted by most of her troops, and was compelled to surrender. Bothwell fled, and never returned. The queen was com-
mitted to Lochleven castle, where on July 24 she signed an act of abdication in favor of her son, and other acts arranging the government, of which Murray was to be the head as regent. These acts were extorted from her, and depended for their validity entirely upon the power of the confederates to maintain their position. On Murray's return from France, he visited Mary, and by working on her fears he had the art to make her request him to accept the regency. Parliament passed an act virtually dethroning the queen, and charging her with being privy to Darnley's murder. On May 2, 1568, she made her escape from Lochleven, and rallied a powerful force to her support, which was defeated at Langside, May 13, by Murray. Mary fled to England, which she entered May 16. There was no occasion for this course, which was the most unwise she could have adopted. At first she was treated with some consideration by Elizabeth, but the latter assumed the part of judge between Mary and her opponents, and decided on her guilt or innocence of the charges preferred against her. The examinations were unfairly conducted, and injured Mary's reputation. During the early years of her residence in England she was variously treated, and it was not till 1573, when her party in Scotland was finally overthrown, that she lost all hope of deliverance from that quarter. She was concerned in various attempts against Elizabeth's government, and sought to marry the duke of Norfolk. She intrigued with the king of Spain, and with other foreigners of eminence, for her liberation. The northern rebellion, headed by the dukes of Northumberland and Westmoreland, which was the last open effort made by the Catholics to restore the old faith, she discouraged. At one time, in 1571, Elizabeth was on the point of restoring her; but in 1572 she engaged in a treaty with the Scotch government for the surrender of Mary, who was to have been tried, condemned, and put to death. This plan failed through the death of the regent Mar, as it had previously failed through the deaths of the regents Murray and Lennox. Her hand was sought by Leicester, by Sir George Carey, a near relative of Elizabeth, and by Don John of Austria. She was confined in various places, her chief custodian being the earl of Shrewsbury. In most cases her treatment was outrageous, and shows the extent of Elizabeth's personal hatred of the woman she had wronged, and that she desired to effect her destruction. Mary was both feared and hated by the reformers, who demanded her death through the ministers of Elizabeth and through parliament. She was believed to be the principal person in all the numerous conspiracies against Elizabeth, though with most of them she could have had no connection. An "association" was formed, directed not only against those who should do violence to Elizabeth, but also against those for whose benefit the crime should be committed. Parliament sanctioned this association in 1585. Babington's conspiracy was formed in 1586, one of the objects of which was to liberate Mary, who had some correspondence with Babington, in which no encouragement, however, was given to his designs against Elizabeth. This conspiracy early became known to Elizabeth's ministers, who nursed it, until even the queen became alarmed, and compelled the arrest of the assassins. It was then resolved to proceed against Mary, who had been removed to Fotheringay castle, Sept. 25, 1586. A commission, composed of 46 persons, was appointed to try her. At its head was the chancellor, Bromley, and the treasurer, Burleigh, was one of its members. The other members were all persons of eminence, either state officers, or peers, or lawyers. This commission, of which 11 members refused to act, met at Fotheringay castle on Oct. 11, 1586, and, after overcoming Mary's original determination not to acknowledge its jurisdiction, proceeded with the trial on the 14th. She defended herself with skill and success against the great array of talent on the other side, and the commissioners durst not come to a decision in her presence. They adjourned to Westminster, after sitting two days, and on Oct. 25 they unanimously declared her guilty. It was not until Nov. 19 that Mary was informed of their decision, and she heard it with calmness. Efforts to save her life were made by the governments of France and Scotland. The publication of the sentence of death, Dec. 4, in London, was received with extravagant demonstrations of joy. Parliament urged execution. Elizabeth, however, seemed reluctant to proceed to extremities, and for six weeks the warrant for her execution remained unsigned in the hands of Davison; nor is it certain that she ever signed it. A warrant purporting to bear her signature was given by Burleigh and his associates to Beale, Feb. 8, 1587, but there is evidence that it may have borne that signature in consequence of a forgery effected by one Harrison, a clerk in the service of Secretary Walsingham, the most implacable and dishonest of Mary's enemies. An attempt to induce her jailers to poison her, in which Walsingham and Davison were the principal instruments, had failed. On Feb. 7 the earsls of Kent and Shrewsbury proceeded to Fotheringay castle, and informed Mary that she must prepare to die the next morning, at 8 o'clock. She was taken by surprise, but bore herself with characteristic firmness. She made all her preparations for death with deliberation, and at the appointed time proceeded to the scaffold, which had been erected in the banquetting hall. She was denied the presence of her almoner, and was rudely importuned to change her faith by the bigoted dean of Peterborough, and by the brutal earl of Kent, whose efforts she quietly but firmly repulsed. She died with heroic bravery; and even when the executioner at first struck her on the skull, in-
fecting a horrible wound, she did not shrink or groan. Two more blows were necessary to despatch her. After being contemptuously neglected for six months, her remains were buried in Peterborough cathedral, Elizabeth acting as chief mourner through Lady Bedford; and 25 years afterward they were removed to Henry VII.'s chapel, in Westminster abbey, by order of her son James L. When Elizabeth was informed of Mary's death, she expressed great indignation, forbade Burleigh and Walsingham her presence as the sole authors of the crime, and sent their principal tool, Secretary Davison, to the tower, and had him fined £10,000. Davison's word is all the evidence that exists of Elizabeth having signed the warrant, and he was not only a witness in his own cause, but had been concerned in an attempt to induce Mary's jailers secretly to poison her.—The question of Mary's guilt or innocence of the crimes charged against her has been vehemently debated for three centuries, and hundreds of works have been written on it, while she has been a favorite character with poets and novelists. The question seems no nearer to a solution now than it was in the early days of her residence in England, when it was debated by George Buchanan on the one side, and by Lesley, bishop of Ross, her champion, on the other. Among the numerous works in relation to Mary, we cite those of Lesley, "Defence of the Honor of Marie, Queen of Scottland and Dowager of France" (London, 1569); George Buchanan, De Maria Scotorum Regina, &c. (London, 1571; translated into English by Robert Leck-Previk, and also into French); William Udall, "Historie of the Life and Death of Mary, Queen of Scotland" (London, 1624); William Sanderson, "Compleat History of the Lives and Reigns of Mary, Queen of Scotland, and of her son James VI." (London, 1656); "The Genuine Letters of Mary, Queen of Scots, to James, Earl of Bothwell," translated from the French originals by Edward Simmonds (West-}

**MARYVILLE**

MARYVILLE, a town and the capital of Blount co., Tennessee, on the Knoxville and Charleston railroad, 16 m. S. by W. of Knoxville; pop. in 1870, 811, of whom 103 were colored. It is the seat of Maryville college (Presbyterian), founded in 1819 and chartered in 1842. The college embraces the usual collegiate course of four years, a ladies' course of four years, preparatory courses, and an English course of three years. In 1873-4 it had 3 professors, 6 instructors, 131 students (collegiate, 25; preparatory, 24; ladies' course,
MASACCIO

22: English course, 60, and a library of 2,000 volumes. The grounds embrace 65 acres, and contain three buildings, recently erected at a cost of $50,000. The situation is noted for its healthfulness and beauty.

MASACCIO, a Florentine painter, whose real name was TOMMASO GUIDI, born at San Giovanni, near Florence, early in the 15th century, died in 1443. He is said to have been a pupil of Masolino da Panicale, and from his personal habits was called Tommasaccio (shortened to Masaccio), "slovenly Thomas." While a young man he visited Rome, and painted there in the chapel of Santa Caterina in the church of San Clemente a series of frescoes from the life of St. Cathearine, and other subjects, which are the earliest works ascribed to him with any certainty. In 1434 he returned to Florence. His frescoes illustrating the life of St. Peter, in the Brancacci chapel of the Carmelite church, introduced a marked improvement in painting. The subjects were the "Expulsion of Adam and Eve from Paradise," the "Tribute Money," "Peter raising a Youth to Life," "Peter and John healing the Cripple," "Peter and John distributing Alms," and "Peter baptizing Converts," in which the figure of a young man who has thrown off his garment and is shivering with sudden cold is celebrated in the history of art.

MAS Æ FUERÀ. See CHILL, and JUAN FERNANDEZ.

MASANIELLO (a contraction of TOMMASO ANIELLO), an Italian popular leader, born in Analfi in 1620, assassinated in Naples, July 16, 1647. He was a fisherman, but headed a successful revolt against the duke of Arcos, who as viceroy of Philip IV. of Spain, in order to defray the expenses of a war against France, had levied a tax on fruit and vegetables, the food of the common people. On July 7, 1647, a dispute in the market place as to which of two parties should pay the odious tax collected a crowd, into which Masaniello, who was a great favorite with the populace, ran shouting, "No taxes! no taxes! long live the king of Spain! down with the bad government!" After speaking a few eloquent words, he was made by acclamation chief of the angry populace, which poured through the streets, demolishing the tax-gatherers' houses, burning palaces, opening prisons, and driving the viceroy into the castle. An impromptu commonwealth was organized, and Masaniello was proclaimed "captain general of the Neapolitan people." After an unsuccessful attempt by some nobles to make away with him, which resulted in the slaughter of the would-be assassins, the viceroy accepted articles drawn up by the insurgents, which abolished the impost upon estables, restored the privileges bestowed by Charles V., and granted a general amnesty, the Neapolitans to remain in arms until the articles should have been ratified by the king of Spain. This negotiation completed, Masaniello threw off the rich robes he had assumed, declared himself again a fisherman, and knelt at the feet of the cardinal archbishop of Naples. But the people would not suffer him to resign. The next day, after a feast with the duke of Arcos, he became delirious, whether from the effects of over-good fortune or of poison, and his whole nature changed. The reign of freedom now rapidly became a reign of terror. For four days longer the people obeyed him; but on July 16, nine days after he became chief, he was assassinated in a convent, where he had taken refuge from their jeers. His body was dragged through the streets and subjected to all kinds of outrage, and his head was sent to the viceroy. The next day head and body were put together by the fickle populace, who, to the number of 50,000, followed the remains to the tomb, where military honors were paid by order of the viceroy. He was killed as a tyrant, but was subsequently revered by the people as a liberator. Anber's opera of La muette de Portei, also known as Masaniello, is founded upon his nine days' career. Ca rafa de Colibrano also wrote an opera, Masan iello, which is now obsolete.

MAS À TIERRA. See JUAN FERNANDEZ.

MASAYA, an inland city of Nicaragua, in the department of Granada, 15 m. S. E. of Managua; pop. about 12,000, nearly all Indians. It has not a single public edifice worthy of notice; but the suburbs, consisting of immense flower and fruit gardens dotted with Indian huts, are remarkably picturesque. The water supply is raised by a steam pump to the town, from a lagoon of the same name, with an area of 10 sq. m., a short distance S. of and 368 ft. lower than Masaya. The chief industries are agriculture, and the manufacture of earthenware, hats, mats, hammocks, and some cotton and pita tissues. The feast of San Gerónimo, the patron of one of the four cantons into which the town is divided, is annually attended by about 50,000 persons. In the vicinity is a volcano of the same name, 5,972 ft. high, the last great eruption of which occurred March 16, 1772, when a torrent of lava was poured out, which covers a portion of land 2 m. wide, forming a gloomy barren waste in the midst of the luxuriant vegetation by which it is surrounded. Not far from the city are rocks and ruins covered with antique red paintings and rude hieroglyphics.

MASCAGNI, PAOLO, an Italian anatomist, born at Castelletto, near Siena, in 1752, died in Florence, Oct. 19, 1815. He became professor of anatomy at the university of Siena in 1774, and in 1784 obtained a prize from the French academy of sciences. In 1787 appeared his most important work, Vasorum Lymphaticorum Corporis Humani Historia et Iconographia. From 1801 till his death he was professor of anatomy, physiology, and chemistry in the hospital of Santa Maria at Florence. He left Anatomia per uso degli studiosi di scultura e pittura (Florence, 1816), and Anatomia universa, with illustrations (Pisa, 1820-31).
MASCARA, a town of Algeria, in the province and 45 m. S. E. of the city of Oran; pop. in 1866, 9,442. It has two public squares, two market places, a mosque, and carpet factories. It was the residence of Abd-el-Kader, and in 1835 was burned down by the French. Subsequently it was rebuilt, and it is now an important emporium of inland trade.

MASCARENE ISLES, the name of a group of islands in the Indian ocean including Mauritius (formerly Isle of France) and Rodriguez, which belong to Great Britain, and the French island of Réunion (formerly Bourbon). The name is derived from that of Mascarenhas, the Portuguese discoverer of the group.

MASCOUTINS, an Algonquin tribe, near Lake Michigan, who figure largely in early French accounts. They were closely united with the Foxes and Kickapoos, and when first known to the French, about 1620, were at war with the Ottawas and even with the Neutral Nation on Niagara river. Allonec in 1669 found them on the Wisconsin, and later they were on the Fox. Some at a still later day removed to the Ohio. In 1712 they joined the Foxes and Kickapoos against the French, and maintained a hostile attitude till the close of the French rule. They showed similar hostility to the English, attacking Col. Croghan near the Wabash in 1763; and to the Americans, attempting to cut off Clarke by treachery in 1777. In all these operations they appear acting with one of their kindred tribes, and in this century are never treated as a distinct body. The Hurons called them Asistaeronon, or Fire Nation, but some writers at an early date declared the translation erroneons, and maintained that the name Mascoutin meant prairie.

MASÈRES, Francis, commonly called Baron Masères, an English mathematician, born in London, Dec. 15, 1731, died at Reigate, May 19, 1824. He was educated at Cambridge, studied law, and, after a few years' practice was appointed attorney general for Canada, and resided in Quebec till 1773. After his return to England he recommended conciliatory measures with the American colonies, and was appointed to the sinecure office of cursitor baron of the exchequer. He wrote "The Elements of Plane Trigonometry" (1750); a treatise against the abuse of the negative sign in algebra (1758); a learned treatise on "Life Annuities" (1763); and numerous papers in the "Philosophical Transactions." He also published "Scriptores Logarithmici" (6 vols., 1701-1807), and "Scriptores Optici" (1829).

MASHAM, Abigail, lady, the favorite of Queen Anne of England, born about 1670, died Dec. 6, 1734. The place of her birth was probably London, where her father, Francis Hill, was a merchant, and married the aunt of the duchess of Marlborough, a Miss Jennings. He ruined himself by becoming a speculator, and Abigail, his eldest daughter, became a waiting woman to the wife of Sir John Rivers. When the duchess of Marlborough learned of the poverty of her relatives, the Hills, she afforded them great assistance. By her influence Abigail was appointed bedchamber woman to the princess; but the arrogance of the duchess offended all her recipients in her bounty. Availing herself of her confidential position in the service of Anne, who had become queen, Abigail Hill was steadily undermining the duchess of Marlborough at court. Samuel Masham, a gentleman of the bedchamber to the prince of Denmark, became attached to Abigail, and the queen was the confidante of their courtship, of which the Marlboroughs knew nothing. Anne was present at their marriage, which took place in 1707. After a long and bitter struggle, the Marlborough influence was overthrown, the whig ministry was dismissed, and the tories came into power, and made the treaty of Utrecht with Louis XIV. At the close of 1711 her husband was made Baron Masham of Otis, being one of the twelve peers created to enable the tory ministers to force their measures through the house of lords. In the quarrel between Oxford and Bolingbroke, Lady Masham sided with the latter. On the death of Queen Anne in 1714, her court favor came to an end, and she and her husband retired to their seat at Otis.

MASINISSA, or Massinissa, a king of Numidia, born about 240 B. C, died in 148. He was the son of Gala, king of the Massylians, the most powerful tribe in E. Numidia, and received a superior education at Carthage, which when he reached the age of manhood commenced its second great struggle against Rome, under the lead of Hannibal. The Carthaginians prevailed on the Massylians to declare war against Syphax, king of the Massaeulians, a rival Numidian tribe, who had espoused the cause of the Romans. Masinissa commanded his father's army, routed Syphax (213), and crossed over to Spain, where the Numidian horse greatly contributed to the defeat of the brothers Cneius and Publius Scipio. Scipio Africanus the elder, by E. Numidia, made the captive nephew of the Numidian, to his uncle with presents and a courteous message, paved the way for a secret understanding with the latter, which proved disastrous to Carthage when Scipio finally carried the war into Africa. Masinissa is said to have been influenced by resentment against Hasdrubal, who had betrothed to him his daughter Sophonisba, but in order to gain over Syphax broke his promise and gave her to the latter. Returning to Africa, where his father had in the mean while died, Masinissa reconquered his kingdom from a usurper, but was soon attacked by the Carthaginians with their new ally, was repeatedly routed, and saved his life by flight. At this juncture Scipio landed in Africa (204), and Masinissa was enabled not only to regain his possessions, but while assisting his victorious allies, jointly with Leitus, one of their commanders, took Cirta, the capital of Syphax. Sophonisba became his captive, and soon his
wife. Being afraid of the influence of Hasdrubal’s daughter over her new consort, Scipio severely reprimanded Masinissa, and asked the surrender of the Carthaginian woman as a captive of Rome. Unable or unwilling, at the risk of his power, to defend the freedom of his wife, Masinissa saved her from the ignominy of Roman captivity by sending her a cup of poison, which she drank without hesitation. Syraphas was sent to Italy, where shortly after he died. In spite of his tragic loss, Masinissa from ambition persisted in his fidelity to Rome, and his aid contributed not a little to the issue of the battle of Zama (209), in which he commanded the cavalry on the right wing of Scipio's army, and which terminated with the rout of Hannibal. Peace was concluded soon after (201), and Masinissa was rewarded by the victors with a part of the territories of Syraphas. He reigned in peace for 60 years, developing the resources of his kingdom by the promotion of agriculture, and extending its limits by annexations from the possessions of Carthage, which were approved of by the senate of Rome, and in consequence of which a few years before his death he once more entered the field of the Carthaginians made it easier for the Romans subsequently to conquer them; and the last Punic war commenced soon after, in the second year of which Masinissa died, leaving his possessions to be divided by Scipio among his three legitimate sons Micipsa, Gulassa, and Mastanabal, with rich donations to their very numerous illegitimate brothers.

**MASK**

**Maskell, William**, an English clergyman, born in Bath in 1814. He graduated at University college, Oxford, in 1836, took orders in 1837, and became rector of Corsecombe, Dorset, in 1842, chaplain to the bishop of Exeter in 1846, and vicar of St. Mary's, Devon, in 1847. In 1849, the "Gorham case" having been decided against Mr. Maskell's views, he resigned his prebends, and, after an animadversion correspondence with the archbishop of Canterbury, became a Roman Catholic. His principal works are: "Ancient Liturgy of the Church of England" (1844); *Monumenta Ritualia Ecclesiae Angliæ* (3 vols., 1849-72); "Dissertation on Holy Baptism" (1848); "Letter on the Temporal Power of the Pope and his Personal Infallibility" (1869); and "Odds and Ends" (stories, &c., 1873).

**Maskelyne, Nevil**, an English astronomer, born in London, Oct. 6, 1732, died at Greenwich, Feb. 9, 1811. He graduated at Cambridge in 1754, took orders, obligated for some time as curate, and obtained a fellowship in 1756. In 1758 he became a fellow of the royal society, and in 1760 went to St. Helena to observe the transit of Venus. Soon after returning he was sent out to Barbadoes on board the Princess Louisa, to test the merits of Harrison's new chronometers and Irvine's marine chair. In 1765 he became astronomer royal at Greenwich. In 1772 he went to Scotland to determine the mean density of the earth by observing the effect of the mountain Schehallien upon the plumb line. He superintended the "Nautical Almanac," established at his suggestion, from 1767 till his death. He was the first to publish what is termed "a standard catalogue of stars."

**Maskinongé**, a S. W. county of Quebec, Canada, bounded S. E. by Lake St. Peter, an expansion of the St. Lawrence river; area, 3,221 sq. m.; pop. in 1871, 18,079, of whom 14,782 were of French origin or descent. It is drained in the N. W. by the Gatineau and Du Lièvre rivers, and in the S. E. by the Maskinongé and Du Loup rivers and other streams. Capital, Rivière du Loup.

**Mason**, the name of six counties in the United States. I. A W. county of West Virginia, bounded N. and W. by the Ohio river, and drained by the Great Kanawha and its tributaries; area, 300 sq. m.; pop. in 1870, 15,978, of whom 594 were colored. It has a diversified surface and fertile soil, and contains iron ore, coal, and valuable salt springs. The chief productions in 1870 were 115,350 bushels of wheat, 4,650,990 of Indian corn, 45,464 of oats, 84,534 of potatoes, 58,600 lbs. of tobacco, 22,853 of wool, and 4,935 tons of hay. There were 2,563 horses, 2,532 milk cows, 5,183 other cattle, 9,880 sheep, and 9,879 swine. Capital, Point Pleasant. II. A W. central county of Texas, intersected by the Rio Llano, a branch of the Colorado, and watered by affluents of the Llano and the San Saba; area, 910 sq. m.; pop. in 1870, 678, of whom 26 were colored. About one tenth of the surface is prairie, and the rest timbered. Two thirds is suitable for farming. Stock raising is the principal business. The chief productions in 1870 were 7,740 bushels of Indian corn, 598 of sweet potatoes, 5,510 lbs. of wool, 6,945 of butter, and 141 tons of hay. There were 188 horses, 19,703 cattle, 1,943 sheep, and 2,829 swine. Capital, Mason. III. A N. E. county of Kentucky, bordering on the Ohio river, intersected by the N. fork of Licking river, and drained by Limestone and Lee's creeks; area, 236 sq. m.; pop. in 1870, 18,126, of whom 3,582 were colored. The surface is diversified, hilly toward the north, and the soil fertile. The chief productions in 1870 were 72,850 bushels of wheat, 54,450 of rye, 760,000 of Indian corn, 45,076 of oats, 42,140 of barley, 41,731 of potatoes, 1,593,156 lbs. of tobacco, 19,178 of wool, 166,329 of butter, and 4,744 tons of hay. There were 4,182 horses, 1,561 mules and asses, 2,598 milk cows, 5,221 other cattle, 5,659 sheep, and 18,202 swine; 2 manufactories of agricultural implements, 9 of carriages and wagons, 1 of cotton goods, 2 of woolen goods, 2 breweries, and 2 saw mills. Capital, Maysville. IV. A central county of Illinois, bounded N. W. by the Illinois and S. by the Sangamon rivers; area, 580 sq. m.; pop. in 1870, 16,184. The surface is low, and
the soil, which is mostly prairie, very fertile. The Peoria, Pekin, and Jacksonville, the Springfield and Northwestern, and the Jacksonville division of the Chicago and Alton railroad pass through it. The chief productions in 1870 were 198,889 bushels of wheat, 49,182 of rye, 2,648,-726 of Indian corn, 272,660 of oats, 71,745 of potatoes, 231,960 lbs. of butter, and 8,943 tons of hay. There were 6,541 horses, 1,986 mules and asses, 4,217 milk cows, 8,097 other cattle, 1,995 sheep, and 16,554 swine; 7 manufactories of carriages, 4 of brick, 9 of saddlery and harness, and 5 flour mills. Capital, Havana.

V. A W. county of Michigan, bordering on Lake Michigan, and drained by the Notipekago, Marquette, and Great and Little Sable rivers; area, 460 sq. m.; pop. in 1870, 3,283. The surface is generally level and the soil fertile. The chief productions in 1870 were 4,768 bushels of wheat, 12,281 of Indian corn, 9,457 of oats, 37,515 of potatoes, and 636 tons of hay. There were 168 horses, 275 milk cows, 520 other cattle, and 746 swine. Capital, Péro Marquette. VI. A W. county, Washington territory, having Puget sound on the E.; area, 1,600 sq. m.; pop. in 1870, 289. The Olympus and Coast mountains extend through it, and between and among them are several broad and fertile valleys. Some lumbering is carried on. The many inlets of the sound afford good harbors. The chief productions in 1870 were 1,000 bushels of oats, 2,550 of potatoes, and 412 tons of hay. The value of live stock was $14,250. Capital, Oakland.

MASON, the name of a family of Virginia. The first of the family who came to North America was Col. George Mason, a member of the English parliament in the reign of Charles I. He opposed the arbitrary policy of the king, but resisted extreme measures against him. He was an officer in the army of Charles II., and after his defeat in Worcester in 1651 escaped to Virginia, losing all his possessions in England. His great-grandson, of the same name, about 1728 married Anne Thomson, a favorite niece of Sir William Temple, and had by her two sons and a daughter. I. George, eldest son of George Mason and Anne Thompson, born at Dog's Neck, in Stafford, now in Fairfax co., Va., in 1726, died in the autumn of 1792. In 1769 he drew up the non-importation resolutions which were presented by Washington and adopted by the assembly of Virginia. In 1775 the convention of Virginia made him a member of the committee of safety charged with the executive government of the colony. In 1776 he drafted the declaration of rights and the constitution of Virginia, which were adopted by a unanimous vote. He brought forward and carried through, in conjunction with Jefferson, a measure for the repeal of the old disabling acts, and for legalizing all modes of worship, releasing dissenters from parish rates. In 1777 he was elected a member of the continental congress; and ten years later he was a leading member of the federal convention to frame the constitution of the United States, in which he took decided ground against all measures tending to the perpetuation of slavery. He was dissatisfied with the instrument when completed, and declined to sign it, declaring his apprehensions that it would result in a monarchy or a tyrannical aristocracy. Returning to Virginia, he was chosen a member of the convention called to ratify or reject the federal constitution, and in conjunction with Patrick Henry he led the opposition to the constitution in that body, insisting upon about 20 alterations, several of which were afterward adopted by congress and the states. He was elected the first United States senator from Virginia under the constitution, but declined to accept the office. His statue stands with those of Jefferson, Henry, and other illustrious Virginians, at the base of Crawford's colossal statue of Washington in front of the capitol at Richmond. II. Thomson, younger brother of the preceding, born in 1730, died in 1785. He studied law in the Middle States, and on his return to Virginia took ground against the aggressions of the British government, and as early as 1774 published a series of papers in which he maintained the duty of open resistance. The first numbers of these papers appeared under the signature of "A British American," but in the concluding one he made known his real name. In 1778 he was appointed a member of the first supreme court of Virginia, and was soon afterward with his brother nominated by the senate one of the revisers of the laws of Virginia. In 1779 he was elected a member of the house of delegates for Elizabeth City county. He was again a member in 1789, and served as chairman of the committee on courts of justice. III. Stevens Thomson, eldest son of the preceding, born in Stafford, Va., in 1760, died in Philadelphia in 1803. At the age of 20 he reached the rank of colonel in the revolutionary army. He was a member of the Virginia convention in 1788, and of the United States senate from 1794 until his death. He was distinguished for wit and eloquence. IV. Armitstead Thomson, son of the preceding, born in Loudon co., Va., in 1787, killed Feb. 5, 1819. He served during the war of 1812 as colonel of a regiment of horse, and was subsequently a brigadier general of the Virginia militia. He was a member of the Virginia legislature, and in 1815-17 of the United States senate. As it was supposed that he alone, on account of his great personal popularity, could break down the federal champion Charles Fenton Mercer, he resigned from the senate to become a candidate for the house of representatives in the district of London; but he was defeated by a small majority. The contest was bitter, and resulted in several duels; among them was the famous conflict in which he himself was involved with Col. John Mason McCarty, in which he was killed. He left an only child, Stevens Thomson, who...
volunteered in the Mexican war, and as a captain of the mounted rifles was mortally wounded at Cerro Gordo. V. Richard B., grandson of George Mason, an officer of the United States army, died at Jefferson barracks, Mo., in 1850. He served in the Mexican war as colonel of dragoons, and was brevetted brigadier general in 1848 for “meritorious and distinguished” services. He was the first civil and military governor of California. VI. James Murray, also a grandson of George Mason, born on An- alostan island, opposite Washington, Nov. 3, 1798, died near Alexandria, Va., April 28, 1871. He studied law, and in 1820 commenced practice in Winchester, Va. In 1826 he was elected to the Virginia house of delegates, and was twice reelected. In 1837 he was chosen a member of the lower house of congress. He declined a relection and returned to the practice of his profession. In 1847 he was appointed to the United States senate to fill a vacancy, and in 1849 and again in 1855 was reelected. He took a prominent part in the senate, was for several years chairman of the committee on foreign relations, and drafted the fugitive slave law of 1850. He early took part in the secession movement, held in 1861 was expelled from the senate. He was appointed confederate commissioner to England and France, and on Nov. 8, 1861, with his colleague John Slidell, was captured in the Bahamas channel on board the British mail steamer Trent, by Capt. Wilkes. He was confined in Fort Warren, Boston harbor, till Jan. 2, 1862, when he was given up to the British government. During the remainder of the war he resided mainly in Paris, as representative of the confederacy. After its close he went to Canada, where he remained three years, and then returned to Virginia. VII. Stevens Thomson, grandson of Stevens Thomson Mason, already mentioned, born in Loudon co., Va., in 1811, died in New York in January, 1843. His father, John T. Mason, removed to Kentucky, where the son was educated. In 1831 he was appointed secretary of the territory of Michigan, and on the translation of Gov. Cass to the war department at Washington, he became the acting governor. He held this office during the Ohio and Michigan boundary controversy, which excited intense interest and bitter feeling; thousands of troops were marshed to the line with the prospect of a sanguinary conflict. When Michigan organized itself as a state in 1835, he was unanimously elected her first governor, and was reelected for a second term. On retiring from office in 1839, he withdrew from political life, and removed to New York, where he practiced law. VIII. John Y., descended more remotely from the same stock as the above, born in Greensville, Va., April 18, 1799, died in Paris, Oct. 4, 1850. He graduated at the university of North Carolina, studied law, was for ten years a delegate in the Virginia general assembly, and filled several other offices in the state. He was a representative in congress from 1831 to 1837, when he was appointed judge of the United States court for Virginia. He was secretary of the navy under President Tyler, and successively attorney general and secretary of the navy under President Polk. By President Pierce he was appointed minister to France, where he continued until his death.

MASON, Francis, an American missionary, born in York, England, April 2, 1799, died in Rangoon, Burmah, March 3, 1874. His father was a shoemaker, but seems to have been also a Baptist preacher. Young Mason was withdrawn from the parish school to work at his father's trade. While engaged in this employment at Hull, whither his father had removed, he obtained a work on geography containing also an outline of astronomy, and was thus led to attend an evening school, where he acquired a knowledge of algebra, geometry, and trigonometry. In 1818 he came to the United States, went at once to the west, and worked as a shoemaker in various places. He went to Boston in 1824, and worked at his trade in Randolph and in Canton, Mass. At Canton he married, united with the Baptist church, and studied languages with his minister. He entered Newton theological institution in 1827, and in 1830 was sent by the American Baptist missionary union to Burmah. He labored among the Karens, a wild tribe, of whom thousands have since been converted, translating the Bible into two dialects of their language, conducting a seminary for the education of preachers and teachers, and preparing books for their use. In the intervals of his regular labors he gathered specimens of plants, made numerous notes, and published in 1852 a work on the natural productions of Burmah, begun with a view to translating the names of natural objects into the vernacular, which Dr. Hooker pronounced “the most valuable addition to the history of the fauna and flora of British Burmah, of any man of modern times.” A second edition was published under the title, “Burmah: its People and Natural Productions” (8vo, Rangoon, 1860). He was on his way to Calcutta to superintend a revised edition, when he was arrested by his last sickness. He had also published a grammar, chrestomathy, and vocabulary of the Pali language, besides translations from the Burman, Pali, and Sanskrit, and a “Life of Ko-Thah-Byn,” republished in Boston as “The Karen Apostle;” a “Memoir of Mrs. Helen M. Mason” (New York, 1847); a “Memoir of San Quala” (Boston, 1850); and an autobiography, “The Story of a Working Man's Life, with Sketches of Travel” (New York, 1870). He received the degree of D. D. from Brown university.

MASON, Jeremiah, an American lawyer, born in Lebanon, Conn., April 27, 1786, died in Boston, Oct. 14, 1845. His father, Col. Jer- emiah Mason, was an under President Tyler's army, and commanded a company of minute- men at the siege of Boston. He graduated at Yale college in 1788, was admitted to the
MASON, John, major of the forces of Connecticut colony, born in England in 1660, died in Norwich, Conn., in 1770. He served in the Netherlands as a volunteer under Sir Thomas Fairfax, and about 1680 emigrated to Dorchester, Mass., whence in 1685 he removed to Connecticut, and aided in founding the town of Windsor. The settlers were in constant dread of the Pequot Indians, who inhabited a tract of country lying between the Pequot river, now called the Thames, and the territories of the Narragansets in Rhode Island. The slaughter of a party of whites at Wethersfield in April, 1637, at length called for retaliatory measures; and at a general court convened in Hartford, Mason was commissioned, with a force of 90 men, to descend the Connecticut and attack the Pequots at the mouth of the Pequot river. Accompanied by 70 friendly Indians of the Mohegan tribe, he reached the English fort at Saybrook, at the mouth of the Connecticut, in the middle of May, and thence put off into Long Island sound, intending to follow the coast to the country of the Narragansets, and thence by a retrograde march along the shore fall upon his enemies unawares. On the 29th he landed in Narragansett bay, near Point Judith, secured the cooperation of 200 Narragansets, and having sent back his boats to meet him at the mouth of the Pequot, proceeded by quick marches to the Mystic river, in the neighborhood of which were the two principal forts of the Pequots. Although his Indian allies were now swelled in numbers to about 500, such was their terror of the Pequots that Mason was compelled to commence the attack almost unaided. Before daybreak on the 26th he surprised the nearest fort, and, gaining an entrance within the palisades, fell sword in hand upon the enemy. But finding it difficult to dislodge the Indians, he set fire to their wigwams, the whites and their allies forming a circle around the fort to prevent escape. Between 600 and 700 Pequots perished, 7 were captured, and 7 escaped. Of the English 2 were killed and 20 wounded. He then marched to the mouth of the Pequot river, into which his vessels sailed soon after. They were attacked on the way by 300 Indians from the other fort, who however soon retired. Mason, putting his wounded aboard the vessels, marched with a small party by land to Saybrook. Aided by a party from Massachusetts, he then pursued the remnant of the Pequots toward New York, killed and captured many more, and divided the few who remained in Connecticut between the Mohegans and Narragansetts, stipulating that the very name of Pequot should become extinct. He thus secured a general peace with the Indians, which remained unbroken for 40 years. After the Pequot war he removed to Saybrook, at the request of its settlers, for the defence of the colony, whence in 1639 he removed to Norwich. He was mayor of the colonial forces more than 30 years, and between 1660 and 1670 he was deputy governor of Connecticut. He was also a magistrate from 1642 to 1668. At the request of the descendants of the Connecticut Pequots, he prepared an account of the Pequot war, published by Increase Mather in 1677, and republished, with an introduction and notes by the Rev. Thomas Prince (Boston, 1736).—See Sparks's "American Biography," 24 series, vol. iii.

MASON, I. John Mitchell, an American clergyman, born in New York, March 19, 1770, died there, Dec. 26, 1829. His father was of Scotch birth, and pastor of an Associate Reformed church in New York. He graduated at Columbia college in 1793, and entered in 1791 the university of Edinburgh, but was recalled in 1792 by intelligence of his father's death, and succeeded to his pastorate. He subsequently published a pamphlet consisting of "Letters" on frequent communion, which induced the Associate Reformed churches to relinquish their former practice of celebrating the communion but once or twice a year. He projected the plan of a theological seminary which was established in New York in 1804, and was appointed its first professor of theology. In 1806 he projected the "Christian's Magazine," which he conducted for several years. In 1810 he resigned his pastoral charge with the purpose of forming a new congregation. Dr. Mason having established more intimate relations with a Presbyterian church than were believed to be authorized by the constitution of his own denomination, the matter was brought before the synod in Philadelphia in 1811, and was the occasion of his "Plea for Sacramental Communion on Catholic Principles" (1816). He accepted in 1811 the office of provost of Columbia college, which he resigned in 1816. In 1817 he resumed his pastoral charge. In 1821 he became president of Dickinson college, which office he relinquished in 1824 and return-
ed to New York. In 1829 he had transferred his connection from the Associate Reformed to the Presbyterian church. A collection of his works was edited by his son, the Rev. Ebenezer Mason (4 vols., New York, 1832). II. Erskine, an American clergyman, son of the preceding, born in New York, April 16, 1805, died there, May 14, 1851. He graduated at Dickinson college in 1823, and became pastor of a Presbyterian church at Schenectady in 1827, and of the Bleecker street church in New York in 1830. From 1836 to 1842 he was professor of ecclesiastical history in the Union theological seminary, New York. He published several occasional sermons, and a collection of his discourses appeared after his death, under the title of "A Pastor's Legacy," with a sketch of his life by the Rev. William Adams, D. D. (New York, 1853).

MASON, Lowell, an American composer, born in Medfield, Mass., Jan. 8, 1792, died in Orange, N. J., Aug. 11, 1872. From childhood he manifested great fondness for music, and at a very early age he began teaching it. In 1812 he removed to Savannah, Ga., where he gave instruction and led choirs and musical associations. In 1821 his "Boston Handel and Haydn Collection of Church Music" was published; and its success led him to remove to Boston, where in 1827 he commenced the instruction of classes in vocal music. About 1828 he became a champion of the Pestalozzian method of teaching music. Juvenile classes were now established and taught gratuitously by Mr. Mason, who was soon propelled by the extent of his labors to associate Mr. G. J. Webb with him. He published 15 or 16 juvenile collections of music, 7 or 8 glee books, mostly in connection with Mr. Webb, and more than 20 sacred and church music books. His latest work, "The Song Garden," appeared in 1866. In all these books are many pieces of his own composition, and many more adapted by him from the compositions of other authors. In conjunction with Professors Park and Phelps, he compiled a "Collection of Psalms and Hymns for Public Worship" (New York, 1858).

MASON, William, an English poet, born in Hull in 1725, died in York in April, 1797. He was the son of a clergyman, graduated at the university of Cambridge in 1745, and became a fellow in 1747. Having taken orders, he became rector of Asten in Yorkshire, and chaplain to the king. He was opposed to the American war and a member of the Yorkshire association for obtaining a reform of parliament; but the horrors of the French revolution are said to have changed his opinions. He was for years precentor and resident canon of York. His principal works are: "Caractacus" (London, 1759), and "Elfrida" (1792), dramatic poems; "The English Garden," a descriptive poem (1785); and "Essays on English Church Music" (York, 1795). He was an intimate associate of Gray, and published an edition of his poems with a memoir. A complete edition of Mason's poems was published in York in 1771.

MASON AND DIXON'S LINE, the parallel of lat. 39° 43' 20'' N., which separates Pennsylvania from Maryland, drawn by Charles Mason and Jeremiah Dixon, two distinguished English mathematicians and astronomers. As the northern limit (with the exception of small portions of Delaware and Virginia) of the original slave states, it was prominently mentioned in the controversies concerning slavery. It begins at the N. E. corner of Maryland, and runs due W. The years from 1681 to 1768 were marked with constant dissension and conflict between the rival proprietaries of Pennsylvania and Maryland and their partisans, on the subject of their common boundary; and the vicinity of this line was the theatre of riot, invasion, and bloodshed. Mason and Dixon arrived in Philadelphia on Nov. 15, 1763, and commenced their work in December, which was continued to a point 244 m. from the Delaware river, and within 86 m. of the whole distance to be run, where they were compelled to suspend operations in consequence of opposition by the Indians. They returned to Philadelphia, and were discharged on Dec. 26, 1767. At the end of every fifth mile a stone was planted, graven with the arms of the Penn family on one side, and of Lord Baltimore on the other. The intermediate miles were marked with smaller stones having a P on one side and an M on the other. The stones were all sent from England. In November, 1782, Col. Alexander McClean of Pennsylvania and Joseph Neville of Virginia ran the remaining part of the line, which was tested and corrected by astronomical observations, and permanently marked, in 1784. In 1849 the former surveys were revised, and found correct in all important points.

MASORA. See Bible, vol. ii., p. 610.

MASOVIA, or Mazovia, during the earlier centuries of independent Poland, a duchy or principality on both sides of the middle Vistula, inhabited by the Mazurs, a Polish tribe. In the Russian kingdom of Poland as established in 1815, it formed a palatinate with Warsaw as its capital. It is now mainly embraced in the government of Warsaw.

MASQUE, a species of dramatic entertainment, comprehending scenic effects and dancing. It was much cultivated in Europe during the 16th and 17th centuries, and reached its highest perfection in England in the reign of James I. Originating in the pageants, shows, and religious processions of the middle ages, the actors in which wore masks, and in the early miracle and moral plays, it gradually became a recognized form of the spoken drama, and the only one in which females, generally ladies of rank, took part. In the reign of James I. Ben Jonson and the leading dramatic authors, with the exception of Shakespeare, wrote masques for the court. Milton's "Comus" and "Arcades" are exquisite speci-
men. The genius of Inigo Jones was for several years employed exclusively upon the decorations and elaborate machinery of the court masques, and Henry Lawes furnished the music for several of them. The queens of James I. and Charles I., with the chief nobility of the court, participated in these entertainments, the preparation of which frequently occupied many months, and cost immense sums. With the death of Ben Jonson, who may be regarded as the chief writer of masques, the taste for them died away.

MASS (Lat. missa, from mittere, to dismiss), in the Roman Catholic church, the form of celebrating the Lord's supper. When first introduced, the term denoted the dismissal of the catechumens and penitents, who were permitted to be present at the introductory, but not at the sacramental service, before the beginning of which they were called upon to leave the church. The two parts of the service were then distinguished as missa catechumenorum and missa paxuim. The oldest writing in which we find the term missa is a letter of St. Ambrose, and very soon after his time it passed into general use. According to the definition of Roman Catholic theologians, the mass is the true sacrifice of the new law—an offering instituted by Christ, in which, by the consecration and consumption of his body and blood under the form of bread and wine, Christ himself is mystically slain and offered as a victim to God the Father in recognition of his sovereign dominion. The Catholic church believes that by the words of consecration, pronounced by the priest over the bread and the wine, these elements are changed into the body and blood of Christ. The sacrifice of the mass is not considered to be substantially different from the sacrifice offered by Christ on the cross, but a repetition of it, Christ offering himself again through the hands of the priest. Through it the merits of Christ are believed to be available to men. It is called a propitiatory sacrifice, as Christ is believed to be really present as a victim, asking pardon for sinners as he did on the cross. The Roman Catholic church therefore sometimes offers masses specially for the dead, whom she mentions indeed in every mass. As she believes that Christians who leave this world without having sufficiently expiated their sins are obliged to suffer a temporary penalty in the other, she prays God, through Jesus Christ, for the remission of this penalty. The mass is called a eucharistic sacrifice, because it is believed that by offering Christ the church expresses gratitude to God in the best possible manner; and an imperatorial sacrifice, because she hopes that God, touched by this offering, will grant new intercessions. In the first centuries bishops when celebrating mass were attended by other bishops or by priests, who offered, consecrated, and communicated with them. This was termed consellebrare and consacriare. This custom prevailed in both the Greek and Latin churches; and in the latter it is still usual for priests on the day of their ordination to celebrate with the ordaining bishop. In the Lyonnese rite, which has very recently been abolished, a number of priests thus officiated with the bishop at solemn pontifical mass. It was also a rule in the early church, when bishops visited each other, that they should unite in celebrating as a sign of their being of the same communion. In a liturgical point of view, the mass is divided into five parts: 1, the preparatory part, formerly called the mass of the catechumens; 2, the offering, which extends from the offertory to the canon; 3, the canon, including the consecration; 4, the breaking of the host and the communion; 5, the thanksgiving or post-communion. In these parts the liturgies of all the eastern or western churches, except in the Protestant communions, substantially agree (see LITURGY), as well as in prescribing the breaking of the bread, in conformity with the words of the Scriptures, which say that Christ broke the bread. In the beginning, as Justin Martyr testifies in his second apology, the Lord's supper was only celebrated on the Lord's day; but, according to Pollicia, the western Christians began in the 2d century to celebrate it on Fridays and Wednesdays as well, and in the East during the 4th century it became customary to celebrate on Saturdays. St. Augustine says that a great diversity existed about this in his time; it was then the rule to offer the sacrifice daily in the churches of Africa, Spain, and Constantinople, and this rule was made universal in the 6th century. At this epoch the Latin church allowed bishops and priests, wherever there existed insufficiency of church room, to celebrate twice on certain days, and even thrice, on the feast of the Circumcision, Jan. 1. In some places this was done thrice and even four times. On Holy Thursday, every priest was allowed to celebrate thrice, and twice daily during the whole of Easter week. In the 8th century at Rome the privilege of triple celebration was also attached to June 29, the feast of St. Peter and St. Paul. At present the privilege of saying three masses on the same day is restricted in the Roman Catholic church to Christmas. In Spain the privilege is enjoyed by priests on All Souls' day, Nov. 2. In missionary countries, where there is a scarcity of clergy, each priest is permitted, by a special indulgence from Rome, to say mass twice on Sundays and holidays of obligation. In modern times it has been often proposed in the church to celebrate the mass more rarely, and only when a large attendance of the people is to be expected. But the council of Trent confirmed the practice of saying private masses, and recommended a daily celebration. The presence of one who recites the responses is required at private mass. The liturgy of the mass still indicates that in former times all the people who were present communed with the priest. This usage gradually ceased, and the priest was
often left to commune alone. Still, in populous parishes in most Roman Catholic countries, communion is distributed at most private masses, and the utility of frequent communion is sedulously inculcated.—With respect to the language used in the celebration of mass, the western churches use the Latin, and the Roman missal. (See LITURGY, and MISSAL.) The eastern churches in union with that of Rome use the ancient idioms of their respective peoples, and are not allowed to celebrate in Latin. The wishes sometimes expressed by larger or smaller bodies of the Catholic church to translate the liturgy of the mass into the modern languages, and to let the responses at the mass be recited or sung by the entire congregation, have never been favored by the highest ecclesiastical authorities, though in some cases it has been permitted as a privilege, as for instance to the duke Eugene of Wurttemberg, who in 1786 received from Pius VI. permission to introduce the German mass into his court chapel. — There are different kinds of masses. A high or solemn mass is celebrated with the assistance of a deacon and subdeacon, and is sung by choirs; but the principal mass on Sundays and festivals, in which part of the service is sung by the priest without deacon or subdeacon, is usually called in this country high mass. A low mass is one of which no part is sung, and at which the priest has no assistant but his clerk. The ordinary duration of a low mass is half an hour. The mass of the presanctified (missa presanctifiatarum) is the name given to the service celebrated in the Latin church on Good Friday, and in the orthodox Greek church on nearly all the week days in Lent. It consists in the consumption by the priest of the bread consecrated on a previous day; and is, properly speaking, not a mass at all, the consecration being an essential part of the sacrifice. At all masses the priest wears vestments which indicate by their color the ecclesiastical season of the year or the stated festival which is celebrated. Thus red is used for the feast of martyrs, white for those of virgins, purple for the penitential seasons of Lent, Advent, and vigils. At the masses for the dead black vestments are used, some psalms and ceremonies omitted, and the people are dismissed without the benediction.—Masses may be said for any special purpose (votive masses), as for the recovery of health, for the avoiding of danger, for obtaining a special favor, &c. In the middle ages some practices crept in which the church condemned, as the celebration of the mass without the assistance of a clerk, the combination of several masses in one in order to get a greater payment, &c. The "Congregation of Bides," instituted by Sixtus V. in 1587, watches over the purity of the ritual. The Greek church and the other eastern churches hold, in the main, the same views with regard to the mass as the Roman Catholic church. The difference is mostly limited to ceremonies.—Every mem-
ber of the Catholic church is bound, under pain of mortal sin, by one of the "precepts of the church," unless prevented by sickness or other grave impediment, to attend mass every Sunday and on certain holidays called days of obligation.

MASSA, a town of Italy, capital of the province of Massa e Carrara, on the Frigido, 55 m. N. N. W. of Leghorn; pop. about 5,000. It has a lyceum, a gymnasium, a beautiful castle, and important silk manufactories.

MASSA E CARRARA, a central province of Italy, in Tuscany, embracing the former duchy of Massa-Carrara; area, 680 sq. m.; pop. in 1871, 161,944. The principal rivers flowing through it are the Serchio and the Magra. Branches of the Apennines conjointly with the Apan Alps traverse the entire province. The most important product is the marble of Carrara. Wine and olives are cultivated. It is divided into the districts of Massa, Carrara, Pontremoli, and Castelmuvo. Capital, Massa. The former duchy was before 1741 the possession of the house of Cibo-Malaspina, and subsequently, through the marriage of the daughter of the last duke, a possession of the Estes of Modena, together with which it was occupied by the French in 1796. After various changes it was reunited with Modena in 1829, and annexed to the dominions of Victor Emanuel in 1860.

MASSAG, a S. county of Illinois, bordering on the Ohio; area, 240 sq. m.; pop. in 1870, 8,581. The surface is diversified and heavily timbered, and the soil fertile. It contains coal and lead. The chief productions in 1870 were 72,316 bushels of wheat, 133,126 of Indian corn, 22,076 of oats, 13,125 of potatoes, 67,560 lbs. of tobacco, 42,505 of butter, and 2,034 tons of hay. There were 762 horses, 948 milch cows, 1,263 other cattle, 2,297 sheep, and 5,424 swine; 1 manufactory of wagon materials, 1 of tobacco and snuff, 4 saw mills, and 8 flour mills. Capital, Metropolis.

MASSACHUSETTS, one of the thirteen original states of the American Union, and one of the New England states, between lat. 41° 15' and 42° 53' N., and lon. 69° 56' and 73° 52' W.; extreme length N. E. and S. W., 160 m.; breadth from 47 to about 90 m.; estimated area, 7,800 sq. m. It is bounded N. by Vermont and New Hampshire, E. by the Atlantic ocean, S. by the Atlantic, Rhode Island, and Connecticut, and W. by New York. It is divided into 14 counties, viz.: Barnstable, Berkshire, Bristol, Dukes, Essex, Franklin, Hampden, Hampshire, Middlesex, Nantucket, Norfolk, Plymouth, Suffolk, and Worcester. Boston, the commercial centre and the largest city of New England, is the capital; in 1870 it contained 350,526 inhabitants, but by the annexation of Charlestown, Brighton, and West Roxbury, in 1873, its population was, according to assessors' returns, increased to about 360,000 in 1874. The other cities are Cambridge, which in 1870 had 39,634 inhabitants; Chelsea, 18,547;
Fall River, 26,766; Fitchburg, 11,260; Gloucester, 15,389; Haverhill, 13,092; Holyoke, 10,733; Lawrence, 28,921; Lowell, 49,928; Lynn, 28,233; New Bedford, 21,320; Newburyport, 12,505; Newton, 12,825; Salem, 24,117; Somerville, 14,685; Springfield, 26,703; Taunton, 18,622; and Worcester, 41,105. The population and rank of the state in the Union, according to the national census, have been:

Included in the total population of 1860 were 32 Indians, and in that of 1870 87 Chinese, 10 Japanese, and 151 Indians. Of the whole number of inhabitants in 1870, 703,779 were males and 573,572 females; 1,104,093 were native and 353,319 foreign born. Of the natives, 17,313 were born in Connecticut, 55,571 in Maine, 903,297 in Massachusetts, 47,773 in New Hampshire, 24,628 in New York, 14,356 in Rhode Island, and 22,110 in Vermont; 243,784 persons born in Massachusetts were living in other states. Of the foreign born, 65,055 were natives of British America, 13,072 of Germany, 34,099 of England, 216,200 of Ireland, and 9,008 of Scotland. The average density of population was 186-54 persons to a square mile, being greater than that of any other state. There were 305,534 families, with an average of 4.77 persons to each, and 340,473 dwellings, with an average of 6.16 persons to each. The increase of population from 1860 to 1870 was 18.15 per cent. The number of male citizens 21 years old and upward was 312,770. There were 74,933 persons 10 years of age and over unable to read, and 97,742 who could not write, of whom 89,890 were foreign born; 31,746 of the male adult population, or 7.97 per cent., and 53,940, or 12.27 per cent., of the female adults, were illiterate. The number of paupers supported during the year ending June 1, 1870, was 8,036, at a cost of $1,121,044; of the number (5,777) receiving support June 1, 1870, 5,396 were natives and 381 foreigners. There were 1,558 persons convicted of crime during the year; of the number (2,526) in prison June 1, 1870, 1,291 were of native and 1,235 of foreign birth. The state contained 761 blind, 538 deaf and dumb, 2,662 insane, and 778 idiotic. Of the total population 10 years of age and over (1,160,666), there were engaged in all occupations 579,844 persons; in agriculture 72,810, of whom 31,010 were laborers and 89,760 farmers and planters; in professional and personal services 131,291, including 2,040 clergymen, 45,770 domestic servants, 279 journalists, 50,564 laborers not specified, 1,270 lawyers, 2,047 physicians and surgeons, 7,320 teachers not specified, 847 teachers of music, and 506 professional musicians; in trade and transportation, 83,078; in manufactures, mechanical and mining industries, 292,665, of whom 5,774 were blacksmiths, 1,102 bookbinders, 48,265 boot and shoe makers, 23,506 carpenters and joiners, 39,195 cotton mill operatives, besides 4,029 mill and factory operatives not specified, 5,311 fishermen and oystermen, 8,273 machinists, 7,887 painters and varnishers, 16,787 tailors and seamstresses, besides 7,649 milliners and dress and mantua makers, and 19,863 woolen mill operatives. The total number of deaths during the year was 25,859, being 1.77 per cent. of the entire population. Chief among the causes of mortality were consumption, from which 5,157 persons died, and pneumonia, 1,696; the number of deaths from all causes to 1 from consumption being 5, and 15 to 1 from pneumonia. There were 1,685 deaths from cholera infantum, 1,142 from enteric fever, 911 from scarlet fever, 280 from diphtheria, and 1,114 from diarrhoea, dysentery, and enteritis. From the west for about 100 m. Massachusetts has the regular form of a parallelogram about 50 m. wide; thence it spreads out N. E. and S. E. on two sides of Massachusetts bay, terminating S. E. in the long peninsula of Cape Cod, which, describing to the north and slightly to the west a segment of a circle, encloses Cape Cod bay. It also includes several islands, of which Martha’s Vineyard and Nantucket are the largest. Besides the two mentioned, there are Buzzard’s bay on the S. coast, 30 m. long, with an average width of 7 m., and Plymouth bay, a small inlet connecting on the east with Cape Cod bay. The Elizabeth islands are a group of 16 off Cape Cod. (See Elizabeth Islands.) The state has many excellent harbors, the best of which are at Boston and New Bedford. No large and navigable rivers, excepting the Merrimack, find their outlet on the coast. The Housatonic river, which rises in the W. part of the state, and the Connecti-
The Merrimack, which is navigable for sloops to Haverhill, 18 m. from its mouth, flows through the N. E. corner, and supplies immense water power to Lowell, Lawrence, and other manufacturing centres. The falls in the Connecticut afford valuable water power. The other principal streams are the Nashua, Tamton, Concord, Blackstone, and Charles. It contains several small lakes.—The surface of the state is greatly diversified. The extreme west is mountainous, having two ranges of the Green mountains, the Tuglukanic or Taconic and Hoosac ranges, which run nearly parallel to each other and into Connecticut. Saddle mountain in the N. W. corner is 3,600 ft. high, and Mt. Washington in the S. W. corner 2,024 ft. Further E. is the beautiful and fertile valley of the Connecticuts. In this section are several elevations, detached members of the White mountain system, the highest peaks of which are Mt. Tom (about 1,500 ft.) on the W., and Mt. Holyoke (1,120 ft.) near Northampton, on the E. bank of the Connecticut river, and Wachusett mountain (2,018 ft.) N. of the middle of the state. The east and northeast are hilly and broken, and the southeast generally low and sandy. 

—Massachusetts is eminently a region of metamorphic rocks. Those in the E. part of the state especially are largely overspread with the sands, gravel, and bowlders of the drift formation; and the long point of land making the S. E. extremity of the state (see Cape Cod) is so covered with these loose materials, that the rocky beds beneath are entirely concealed. Syenite and granite prevail along the coast, and extensive quarries of these rocks are worked at Quincy, Cape Ann, and other points. Around Boston is a formation of coarse conglomerates and argillaceous slates of obscure age on account of the metamorphic action to which they have been subjected. At Braintree, near Quincy, the slates contain trilobites, but generally not many of the species have been found in these rocks. The fossils would seem to refer the slates to the lower Silurian period. These obscure formations are traced in an irregular belt toward Providence, and near the Rhode Island line they are connected with coal-bearing strata, referable, it is supposed, to the true carboniferous epoch. In many localities in Bristol and Plymouth counties these strata contain beds of anthracite, some of which, as at Mansfield, have been worked for many years; but they are of little or no value, the coal always being much crushed, and the beds very irregular in their production. Gneiss and talcose and mica slates in broad belts traverse the state from N. to S. from the E. portion to the waters of the Hoosatonic in Berkshire. Among these rocks are interspersed a few beds of metamorphic limestone, but no minerals or ores of value. Along the Connecticut river valley, in the triassic or new red sandstone formation, known as the Connecticut valley area, are found very extensive fossil footprints, which from their resemblance to the feet of birds are first called ornithichnites; but they have since been found by Prof. Edward Hitchcock, who gave the name, to be not only the tracks of birds but of other animals. Some of them indicate that they were made by animals of gigantic size. (See Fossil Footprints.) Trap rocks are associated with it, and near the contact of the sandstone and trap, or of the sandstone and the gneiss, are found veins of metallic ores, as of lead, copper, and zinc, none of which, however, have repaid the money spent in their exploration. The principal localities of these ores are at Southampton, Leverett, Montague, Whately, and a few other towns. The high lands which traverse the state from N. to S., dividing the waters that flow into the Connecticut from those of the Hoosatonic, and called the Hoosatonic mountains, are chiefly of gneiss and mica slate. In Middlefield a belt of talcose slate, continued further N. in the mica slate region, reaches the gneiss; and here are developed in near proximity beds of limestone, steatite, and serpentine. The towns along the Hoosatonic and on the same range extending to the N. border of the state are in the region of the altered Silurian sandstones and calcareous formations. This is the most important mineral district of the state, numerous beds of iron ore having been worked for many years, and the quartz rocks affording in their disintegrated bodies of glass sand of unusual purity. In 1874 deposits specially rich in silver, and containing also lead and gold, were discovered in Essex co., near Newburyport, where mining operations have been begun.—In the valleys, particularly of the Hoosatonic and Connecticut, the soil is rich and productive, but a large portion of the more elevated lands and the long sandy coast do not repay the husbandman. The climate near the coast is very variable, with prevailing E. winds, especially in spring. The mean annual temperature is about 48°; spring, 48°; summer, 71°; autumn, 51°; winter, 21°. The annual rainfall is about 55 inches. In the interior it is more equable, and in the mountainous districts very severe in winter.—Of the total area of the state, somewhat less than one half is improved. According to the census of 1870, there were 26,500 farms, of which 1,129 contained between 3 and 10 acres each, 2,539 between 10 and 20, 8,872 between 20 and 50, 8,872 between 50 and 100, 5,643 between 100 and 500, and 40 between 500 and 1,000. The number of acres of improved land on farms was 1,736,221; woodland, 706,714; other unimproved, 287,348. The cash value of farms was $116,432,784; of farming implements and machinery, $5,000,879; total amount of wages paid during the year, including value of board, $5,821,092; total estimated value of all farm productions, including betterments and additions to stock, $22,192,378; of or-
chard products, $393,854; of produce of market gardens, $1,980,321; of forest products, $1,616,818; of home manufactures, $73,378; of animals slaughtered or sold for slaughter, $4,324,658; of all live stock on farms, $17,049,529. The chief productions were, 17,574 bushels of spring and 17,074 of winter wheat, 239,227 of rye, 1,397,807 of Indian corn, 797,664 of oats, 133,071 of barley, 58,049 of buck-wheat, 24,690 of peas and beans, 3,026,363 of potatoes, 597,455 tons of tobacco, 306,659 of wool, 6,559,161 of butter, 2,245,873 of cheese, 61,910 of hops, 399,800 of maple sugar, 25,299 of honey, and 15,284,057 gallons of milk sold. Besides 45,227 horses and 52,263 neat cattle not on farms, there were 41,039 horses, 114,771 milch cows, 24,430 working oxen, 78,851 other cattle, 78,560 sheep, and 49,178 swine. As a manufacturing state, Massachusetts ranks with the first in the Union. The amount of capital invested in manufactures, and the value of the annual products, are greater in New York and Pennsylvania; but in proportion to the population the industries of Massachusetts are more extensive than those of either of the states named. In 1850 the capital invested in manufactures amounted to $88,940,292, and the annual products to $157,743,994; in 1860 the former had increased to $132,792,327 and the latter to $255,545,922. In 1870 the amount of capital invested was $291,077,862, and the value of annual products $553,912,568; the materials used were valued at $334,413,982, while the wages paid amounted to $118,051,886. There were 13,212 establishments using 2,396 steam engines of 78,502 horse power and 3,157 water wheels of 105,854 horse power, and employing 279,380 hands, of whom 179,032 were males above 16, 86,229 females above 15, and 14,119 youth. The aldermen and selectmen of the various cities and towns are required by law to ascertain and return decennially to the state secretary the industrial statistics of the commonwealth. The value of the products of all industries as thus returned amounted to $124,000,000 in 1845, $205,000,000 in 1855, and $577,000,000 in 1865; showing an increase during the last named decade in the value of industrial products of 72 per cent., while the population during the same period increased only 3 per cent. The leading products returned for the year ending May 1, 1865, were:

In the manufacture of boots and shoes, cordage and twine, cotton goods, cutlery, chairs, and straw goods, as well as textiles in general, and bleaching and dyeing, Massachusetts ranks above all other states. The extent of these industries in this state, as compared with the United States, in 1870, is indicated in the following statement:

<table>

While Massachusetts holds the first rank in respect to the industries named, the state is specially noted for the extent of its manufactures of boots and shoes and cotton and woollen goods. Here are the great centres of these industries in the United States. Of the boot and shoe establishments, 1,129 were each producing annually more than $5,000. In these were employed 7,042 sewing and 636926 pegging machines and 51,167 hands. The products embraced 10,129,910 pairs of boots and 29,164,594 pairs of shoes. Nearly one third of the capital invested in the manufacture of cotton goods in the United States was employed in Massachusetts. The machines in use embraced 55,343 looms and 1,255,552 frame and 1,563,989 mule spindles. The cotton consumed amounted to 130,654,040 lbs.; the products included 22,126,147 yards of sheetings, shirts, and twilled goods, 12,434,858 of lawns and fine muslins, 220,013,105 of print cloths, 2,108,052 lbs. of yarn not woven, 2,595,358 dozens of spool thread, 33,712,996 yards of warps, 3,773,664 lbs. of bate, wicking, and wadding, 6,564,954 yards of flannel, 18,690,000 of gingham and checks, and 407,527 lbs. of thread. The value of all products increased from $21,934,401 in 1850 to $88,004,235 in 1860, and $59,498,153 in 1870. In the woollen mills were 1,397 cards, with a daily capacity for 150,484 lbs. of carded wool, 4,470 broad and 3,874 narrow looms, and 470,467 spindles. 37,146,190 lbs. of domestic wool were consumed, besides 2,813,449 of cotton and 5,994,110 of shoddy. The products embraced 403,785 pairs of blankets, 21,819,879 yards of cloths, cassimeres, and doekins, 285,000 of
MASSACHUSETTS
felted cloth, 22,321,684 of flannels, 7,701,880

of satinets, 585,435 shawls, 808,920 yards of
tweeds and twills, and 1,235,161 Ibs. of yarn.

INDUSTRIES.

249

The leading industries of the state, as reported
by the census of 1870, are shown in the following table

:


The movement of foreign shipping at the various ports, and the number of vessels registered, enrolled, and licensed, were as follows:

<table>

Besides the above, 105 vessels of 3,677 tons engaged in the general fisheries entered at Newburyport, and 116 of 3,922 tons cleared. For more than a century the fisheries of Massachusetts have constituted one of its leading industries. (See Fisheries.) The most important centres of this industry are Gloucester, which far surpasses any other part of the country in the magnitude of its cod and mackerel fisheries, and New Bedford, which is the leading market in the United States for the produce of the whale. The entire products of the American whale fisheries for the year ending June 30, 1874, amounted to $2,291,896, including sperm oil valued at $1,250,987, other whale oil $775,919, and whalebone $294,990. Nearly all of these were from Massachusetts, with some captured in the fisheries about 170 vessels belonging to Barnstable, Edgartown, New Bedford, and Salem and Beverly. Of the 2,099 vessels employed in the cod and mackerel fisheries in the United States, 1,026 of 49,578 tons belonged to Massachusetts. According to the census of 1870, more than half of the products of fisheries in the United States, exclusive of the whale fisheries, were the result of Massachusetts industry. The capital invested in this business was $4,287,871, and the number of persons employed was 8,993. Among the products, which were valued at $6,213,393, were 451,125 quintals of cod, 1,651 tons of halibut, 188,507 barrels of mackerel, $486,596 worth of miscellaneous fish, and 305,049 gallons of oil, valued at $302,700. Ship building is carried on in most of the customs districts; in 1874 there were 77 vessels built, of 31,499 tons, including 5 steamers, of 689 tons. About two thirds of these were built in Boston, Charlestown, and Newburyport. The first railroad in Massachusetts was opened for use in 1835, since which time an average of about 50 m. has been annually constructed. On Sept. 30, 1874, the entire mileage belonging to Massachusetts companies was 2,415, exclusive of 637 m. of sidewalks and 626 m. of double track; the length of main track and branches within the commonwealth was 1,782 m., and of double track and sidings 917 m. About 29 per cent. of the main lines are laid with steel rails. Notably there are 60 corporations, but the railroads of the state are controlled by 31 distinct boards of direction. The average cost of roads has been $56,883 62 a mile, in addition to the cost of equipment, $7,701 a mile. The entire amount directly invested in the railroads reported to the state is $165,624,130, including $117,006,798 of stock and $48,573,330 of debt. The total earnings returned for the year amounted to $34,692,483, of which about 49 per cent. were from passengers and 46 per cent. from freight. The number of passengers carried was 42,680,494. The whole number of accidents was 279, of which 127 resulted in death; nearly one third were caused by walking on the tracks. The average of casualties for a series of years from causes not attributable to the carelessness of the person injured has been 1 to each 1,400,000 passengers carried; but in 1874 it was only 1 to each 5,000,000. The railroads are under the general supervision of a board of three commissioners, who are appointed by the legislature, and are required to report annually upon the condition of the roads and corporations, the causes of accidents, &c. The lines completed at the beginning of 1875 are represented in the following table, omitting those less than 5 m. long:

</table>

The transportation facilities will be greatly improved by the completion in 1875 of the tunnel through the Hoosac mountain in the N. W. corner of the state. This work, which will have cost the state not less than $14,000,000, including interest, is, next to the Mt. Cenis tunnel, the longest in the world, being about 42 m. in length. (See TUNNEL.) The 80 street railway corporations in the state have 210 m. of track, including branches and sidings; their capital stock is $5,588,125, exclusive of debt amounting to $2,079,741; the average cost per mile of road and equipment on the road is $701, which will include the cost of road, rails, ties, etc. The number of passengers carried in 1874 was 50,038,979.—The number of national banks in operation Nov. 1, 1874, was 220; paid-in capital, $98,089,350; circulation outstanding, $59,051,019; circulation per head, $40.52;
ratio of circulation to wealth, 2-0 per cent.; to capital, 63-05 per cent. Fifty-one of these banks, with a capital of $50,400,000, and an
outstanding circulation of $225,294,272, were in Boston. There were 179 savings banks, with 702,099 depositors, and deposits amounting
to $217,452,120. The average rate of dividends was 6½ per cent. There were also
4 loan and trust companies, with $1,700,000 capital, and deposits aggregating $9,924,270.
On Jan. 1, 1874, there were 127 fire and mar-
ine insurance companies transacting business in the state, with a paid-up capital of $522,
197,870 and net assets aggregating $86,981,245. The premiums received on risks in 1873 aggregated $84,017,278, while the paid losses amounted
to $61,524,120, showing a ratio of paid losses to premium receipts of 73-23.—The execu-
tive department of the government consists of a governor, whose annual salary is $5,000; a
lieutenant governor, who receives $1,500 for attendance during the regular session of the legislature and $10 a day for extra sessions; a
secretary of the commonwealth, $5,500; treasurer and receiver general, $5,000; auditor
$3,500; attorney general, $5,000; and an execu-
tive council of eight, each of whom receives $750 for the regular annual session of their board, $5 a day for any subsequent session, and
20 cents a mile for travel. These officers are
elected annually by the people. The legisla-
tive department consists of 40 senators and 240 representatives elected annually. Their pay is $750 for the regular annual session, and 20
cents a mile for travel. The president of the
senate and the speaker of the house of rep-
resentatives receive each $1,500 for the ses-
sion. The judiciary comprises a supreme ju-
dicial court, consisting of a chief justice, salary
$6,500, and six justices, who receive $6,000 per annum each. This has exclusive cogniz-
ance of all capital crimes, exclusive chancery jurisdiction so far as chancery powers are given by statute, and concurrent original jurisdiction of all civil cases where the amount in dispute exceeds $4,000 in Suffolk, and $1,000 in other counties. The superior court has criminal ju-
risdiction in all except capital cases, exclusive original jurisdiction of complaints for the flow-
ing of land, and original jurisdiction of all civil actions except those confided to the supreme
and police courts. Actions cannot be com-
mitted in this court unless the debt or dam-
ages exceed $20. The court has a chief jus-
tice, salary $5,300, and nine justices, $5,000 each. The legislature in 1868 united the courts of probate and the court of insolvency. For probate and insolvency purposes, frequent courts are held at different places by the judges in the several counties. A judge and a regis-
ter of probate and insolvency are elected by the
voters of each county. In the large cities there are municipal courts for civil and police
purposes. All the judges are appointed by the
governor for an unlimited time. The election
for state officers and members of the legisla-
ture is held on the first Tuesday after the first
Monday in November, and the legislature meets on the first Wednesday of January. Voters are
required to be 21 years old, to have resi-
ded a year in the state and six months in the
town, to pay a poll tax, and to be able to read.
Massachusetts has two senators and 11 rep-
resentatives in congress, and consequently has
13 votes in the electoral college. For several
generations the practice of spiritual and intoxicating liquor has been a great evil, and the sale as a beverage has been prohibited under penalties ranging from $10
fine and 10 days' imprisonment to $50 fine and
d six months' imprisonment. Ale, porter, strong
beer, lager beer, and all wines, as well as dis-
tilled spirits, are considered intoxicating. The
lawful sale of intoxicating liquors to be used
in the arts, or for medicinal, chemical, or me-
chanical purposes, is vested in a commissioner
appointed by the governor. In 1871 permission
was given to towns to authorize the sale of ale,
porter, strong beer, or lager beer; but in 1873
this law was repealed. For executing the liquor
law and general criminal laws a state police
force was maintained, consisting in 1874 of 1,702,
and for this purpose was appropriated $18,590.
There was also a state prison, built in 1877,
for 520 inmates. To the sum of $105,000,000
was devoted in various ways to the support of
public education, including $22,000,000 for
public schools, and $8,000,000 for high schools.
The income of the public schools for the year
ending June 30, 1874, was $5,025,168. The
public schools for this year had 653,598
scholars, and 11,344 teachers. The income of
the high schools was $515,807. The income of
the state normal school was $28,490. The ex-
spenditure of the commonwealth for education
was $8,781,378. The state had 26 colleges and
institutes, having a total of 2,443 students, and
granted an appropriation of $52,507. The
student bodies of these institutions had a total
of 2,100 men and 443 women. The state had
4,237 Sunday schools, with 334,948 scholars,
and $1,432,520 worth of religious literature was
issued. The state library had 126,193 volumes.
The rate of taxation and debt are as follows:
All property was assessed at $3,500,000,000
and the real estate was assessed at $3,000,000,000.
By the last assessment $3,000,000,000 was
assessed to real estate. The value of all real
estate was $3,500,000,000. The assessed value
of the personal property of one thousand
income-tax payers was $1,200,000,000. The
value of all real estate was $3,500,000,000.
By the first assessment, made in 1855, the
real estate was assessed at $2,279,308,763, and
the taxable property in the state was worth
$2,389,308,763. The assessed value of the
real estate was $2,279,308,763. The assessed
value of the personal property was $242,000,
000, and the total assessed value of all prop-
erty was $2,581,308,763. The assessed value
of the real estate was $2,301,508,763, and
the taxable property in the state was worth
$2,401,508,763. The assessed value of the
real estate was $2,301,508,763, and the tax-
able property in the state was worth $2,401,508,763.
All business corporations are taxed for their real estate and machinery in the place where situated, and their capital stock is taxed by the state at its value over and above the local assessment, the proceeds being distributed to the cities and towns wherein stockholders reside. The property exempted from taxation is valued at $35,088,592, distributed as follows: religious societies, $30,455,075; literary, $13,886,791; charitable and benevolent, $7,726,031; scientific, $2,064,200; agricultural, $506,495. The amount exempted in Boston is $18,718,100, of which $10,650,700 is for churches.—The provisions made by the state for the care of the defective and dependent are liberal and systematic. The charitable and correctional institutions are in charge of separate and independent boards of trustees or inspectors, appointed by the governor and council. They are, however, under the general supervision of the board of state charities, comprising seven members, who collect and publish statistical information concerning them, and recommend to the legislature such action as may seem expedient. On Sept. 30, 1874, the wards of the commonwealth, or persons entirely at its charge, exclusive of prisoners, were 3,820; and adding the blind, the deaf mutes, idiots, and others over whom the state exercises some supervision, the total was 4,103. Including the cost of maintaining the county and city prisons, and of supporting and relieving towns’ poor, which is not directly borne by the state, more than $2,000,000 was paid in 1874 for purposes of charity, reform, or correction; and this amount does not include $470,000 of state aid to soldiers. The ordinary appropriations for public charitable and correctional institutions amounted to $565,500, besides $270,000 for charitable purposes outside of institutions. Half the latter sum being exceptional. Included in the former sum was $95,000 for the insane, $260,500 for the almshouse, workhouse, and juvenile reformatories, $120,000 for the state prison, $30,000 for deaf mutes, $8,500 for the eye and ear infirmary, $30,000 for the blind, and $20,000 for idiots. The total income of the state from these institutions was about $140,000. The institutions, besides the state prison, owned and managed by the state, with the most important statistics for 1874, were as follows:

<table>

Of the total receipts, $343,828 was from appropriations for current expenses, while $282,000 was granted for new buildings. The entire expenditures amounted to $885,047. Each of the above named institutions has a farm, the smallest containing 134 and the largest 375 acres. In 1874 they reported a valuation of $4,200,911 on real estate and $608,949 on personal. The institutions at Westborough and Lancaster are reformatories, the former for boys and the latter for girls; admission to both is by sentence of the courts, and for the term of minority. The establishments at Monson and Bridgewater were originally almshouses; the legislation of 1866 converted the one into a primary school and the other into a workhouse; and the almshouse department of each was abolished in 1872. The school at Monson is for children of poverty, boys and girls; admission is granted by the board of state charities. Several hundred children are annually released from these institutions on probation or indenture, and are regularly visited by the state visiting agents. The general duties
this agency are to look after offending and neglected children, and to promote their welfare. The number of children in families outside the state institutions and subject to supervision Sept. 30, 1874, was about 1,400. The following institutions, not under state control, were also aided by the state in 1874, and received state beneficiaries:

Massachusetts has provided most liberally for its insane inhabitants. In addition to the asylum in Worcester, which has a capacity for 400 patients, that in Taunton, 500, and that in Northampton, 325, the Tewskbury almshouse has accommodations for 300 chronic harmless insane, and a new asylum capable of receiving 450 is in process of construction at Danvers. Moreover, the McLean asylum in Somerville, which is chiefly supported by private benefactions, will accommodate about 200 patients, the city asylum in Boston about 200, and the county asylum in Ipswich about 70; making the entire capacity for this class not less than 2,450. The number of insane in the state in 1874 was stated at 3,543, of whom 2,925 were under the care of hospitals or overseers of the poor, Sept. 30. The whole number in the various hospitals of the state during the year was 3,380; average number, 2,167; discharged, recovered, 248; improved, 395; not improved, 279; died, 241. Of the number (2,217) remaining Sept. 30, 1874, 821 were supported by the state, 866 by towns, and 510 by individuals. The Massachusetts general hospital in Boston, founded in 1811, affords medical and surgical treatment free to those unable to pay for it. It is supported by the income of its invested funds, to which the state contributed $75,000, and the gifts of individuals. It receives from 1,500 to 2,000 house patients annually, of whom more than half are treated free of charge, and its average of out patients exceeds 1,000 per month. The state prison in Charlestown, in charge of a warden appointed by the governor, is conducted on the congregate plan, the convicts being separated at meals and at night, but associated at labor during the day. Disciplinary punishments are the withdrawal of privileges, with solitary confinement in a dark cell. Many of the convicts are taught trades, and a portion of them are instructed in day schools. All are required to attend religious exercises, and have the privilege of a library. The labor of the convicts is let to contractors, and for some years the prison was a source of profit to the state. The income of the institution in 1874 was $81,088, including $77,086 earned by the convicts; the total expenses were $128,673. The number of convicts ranged from 596 to 685, the daily average being 647. The site has been selected in Concord for a new state prison, on the completion of which, according to the original plan, the one in Charlestown will be discontinued. In the several counties of the state, under the management of officers elected by the people, there are 19 jails and 15 houses of correction, though there are but 21 different institutions, as the jail and house of correction are under one roof. In 1873 the legislature authorized the building of a reformatory prison for women, to be erected within two years, and to it when completed most of the female convicts will be sentenced. Men and women convicted of certain minor offenses are sent to the workhouse at Bridgeport, while juvenile offenders are confined in the reformatories at Westborough and Lancaster. An agency for aiding discharged convicts is provided by the state, which appropriated $5,000 for this purpose in 1874; and there is a temporary asylum for discharged female prisoners at Dedham, supported by gifts and the income of investments, for the benefit of which the state has lately made an annual appropriation of $1,500. There are also houses of reformation in Boston and Lowell, besides the industrial school at Lawrence, the Plummer farm school at Salem, and tract schools in Worcester, Springfield, and Cambridge; and there are many private organizations for charitable purposes. The whole number confined in state, county, and city prisons in 1874 was 17,856; average number, 3,485. The entire cost of these was $568,648, while their earnings amounted to $193,312. The county and municipal prisons are to a limited extent under the supervision of a board of prison commissioners appointed by the governor. During 1874, 4,888 paupers were entirely supported by the state, at a cost of $268,096; the average number was 2,229. Besides these, there was an average of 4,057 paupers supported by towns, at a cost of $643,440. Including those partially supported by the state and by towns, the entire cost of pauperism was $1,412,780, of which $408,000 was borne by the state. The almshouse in Tewskbury is now the only state establishment for paupers. The system of public schools in Massachusetts has attained a very high degree of excellence. Every person having under his control a child between the ages of 8 and 14 years is required to
send it to school at least 20 weeks annually, under penalty of a fine not exceeding $50. Cities and towns must provide truant schools and appoint truant officers, who shall cause the confinement for instruction of habitual truants between the ages of 7 and 15 years. Moreover, there are laws prohibiting the employment of children in manufactories to the neglect of their education. There are also laws keeping in visitation the schools of the state for inspection and improvement. In many of the cities and towns text books are furnished free to the pupils in the public schools. The schools are supported by local taxation. The board of education, consisting of 10 members, including the governor and lieutenant governor, has no direct control over the common schools, but exercises an important influence indirectly. It appoints a secretary, who acts as state superintendent, receiving an annual salary of $3,400, which includes the pay of the state's employed truant officers.

The most important information concerning the public schools of the commonwealth for 1873-4 is given in the following statement:

| Number of public schools | 5,435 |
| Average length of public schools | 8 mos. and 8 days. |
| Persons between 5 and 15, May 1, 1874 | 292,431 |
| Pupils of all ages in public schools | 297,025 |
| Pupils under 5 years of age | 2,522 |
| Pupils over 15 years of age | 1,564 |
| Average attendance | 210,248 |
| Ratio of average attendance to whole number between 5 and 15 | 72 |
| Number of male teachers | 1,073 |
| Number of female teachers | 7,631 |
| Number of teachers who have attended normal schools | 1,674 |

The plan of the state director of art education comprehends a 13 years' course of instruction in drawing in the public schools, viz.: three in the primary, six in the grammar, and four in the high schools. Specimens of the drawings made by the pupils are shown in annual public exhibitions. For training teachers of drawing, a state normal art school was opened in Boston in 1873, the legislature having appropriated for this purpose $7,500. The pupils, Jan. 1, 1875, included 58 males and 130 females, and came from 43 cities and towns. Instruction is given by lectures and recitations, with practice; the course, when fully organized, will comprise elementary drawing, painting, sculpture, and architectural and engineering drawing. This is the first institution of this kind established in the United States, and is free to those intending to become teachers of drawing in the Massachusetts schools. The most liberal provision is made by Massachusetts for training teachers. Besides the normal school of art there are five state normal schools under the direction of the board of education. No charge for tuition is made to those who become teachers in the public schools of the commonwealth; others are required to pay $30 a year; and $1,000 is annually appropriated by the state to each school to aid indigent pupils of the former class. The regular course of study occupies two years. One of these institutions is the oldest normal school in the United States, having been established at Lexington in 1839, removed to West Newton in 1844, and to Framingham in 1853. It is exclusively for females, as is also the normal school in Salem. The school in Worcester was opened in September, 1874. The follow-
ing are the statistics of these schools for the year ending Dec. 1, 1874:

To those above named may be added the girls’ high and normal school and the training school in Boston. Teachers’ institutes are held under the direction of the secretary of the state board of education, for which the state appropriates $4,000 annually. The sessions are from three to five days each, and from six to ten are held annually. Nearly 2,000 normal school graduates are teaching in the public schools of the commonwealth. The state agricultural college in Amherst, established with the aid of the national endowment, was opened in 1866; it has an extensive farm, well supplied with thoroughbred animals, and with the buildings and apparatus necessary for imparting a thorough industrial education. The course of study occupies four years, on the completion of which the degree of bachelor of science is conferred. There are agricultural, botanical, and veterinary departments. Applicants for admission must be 15 years of age and pass an examination. The tuition fee is $50 a year. The ordinary annual expenses of the institution are about $30,000, while the regular income is about $25,000, including $10,000 from tuition and room rent and $15,000 from the permanent cash fund of $283,333. In 1874–5 it had 11 instructors and 121 students, a library of 1,500 volumes, and extensive collections in natural history.—Of the leading institutions of learning not under the patronage of the state, Amherst college, Harvard university, and Williams college are described under their respective titles, while Boston college and Boston university are mentioned in the article on that city. The colleges and professional schools of the state are mentioned in the following statement for 1874–5, the number of instructors and pupils in the colleges including also those in the professional departments:

The number of instructors and pupils above given for the Boston university do not include those in the preparatory departments in East Greenwich academy and the New England conservatory of music in Boston. The school of medicine of this university receives pupils of both sexes. The institute of technology in Boston, which is fully described in the articles Boston and Education (vol. vi, p. 431), is one of the most complete institutions of the kind in the United States. The charge for tuition is $300 per annum. In 1874–5 it had 34 instructors and 283 pupils. The Worcester county free institute of industrial science was organized in Worcester in 1868, for practical education in the arts, agriculture, manufactures, mercantile business, &c. It was founded in 1865 by John Boynton, who gave for the purpose $100,000; $200,000 was also contributed by Stephen Salisbury, and a large sum was given by Ichabod Washburn. No charge is made for tuition to residents of Worcester county, but a small charge to others. In 1869 a grant of $50,000 was made by the state, in consideration of which the institution will receive 20 pupils annually for the entire course of three years, free of charge. In 1874–5 it had 10 instructors, 96 pupils, and productive funds amounting to $367,000. Besides these institutions and the agricultural college, special instruction in science is afforded by the Lawrence scientific school and the mining school of Harvard uni-
versity; in agriculture and horticulture by the Bussey institute, connected with the same institution; and in natural history by the museum of comparative zoology in Cambridge and the Anderson school of natural history on Penikese island. (See Harvard University, and Elizabeth Islands.) The university of modern languages at Newburyport has been organized for the purpose of affording to students, without regard to age, sex, or nationality, instruction in European and Asiatic languages, and also modern sciences, by teachers native of the respective countries. The English department is intended for foreign students desiring to learn that language. The endowment fund (1875) exceeds $300,000, which it is intended to increase to $1,000,000, and the buildings for domestic and school purposes are in process of construction. The oriental department is to be first opened. The leading institutions for the superior instruction of females are Abbott academy, Andover; Bradford academy, Bradford; Gannett institute, Boston; Lasell female seminary, Auburndale; Maplewood institute for young ladies, Pittsfield; Mount Holyoke female seminary, South Hadley; Notre Dame academy, Boston Highlands; the Oread institute for young ladies, Worcester; Wheaton female seminary, Norton; Wellesley college, Needham; and Smith college, Northampton. There are not fewer than 150 libraries other than private in Massachusetts containing more than 1,000 volumes each, and about 50 containing 10,000 or more. The largest are that of Amherst college, about 20,000; Andover theological seminary, 32,000; Boston Athenæum, 103,000; mercantile, 20,000; public, 200,000; state, 34,000; Harvard university, 200,000; free public library, New Bedford, 30,000; Essex institute and Athenæum, Salem, 40,000; city library association, Springfield, 36,000; museum of natural history, Springfield, 28,000; American antiquarian society, Worcester, 55,000; and the public library of Worcester, 35,500. According to the census of 1870, the whole number of libraries was 3,169, with an aggregate of 3,017,813 volumes. Of these, 1,625, with 1,007,304 volumes, were private, and 1,544, with 2,010,609 volumes, other than private, including the state library of 35,000 volumes; 95 town, city, &c., 475,853; 12 court and law, 27,708; 20 school, college, &c., 253,127; 1,042 Sabbath school, 539,609; 164 church, 85,956; 11 of historical, literary, and scientific societies, 186,800; 6 of benevolent and secret associations, 63,000; and 186 circulating, 347,556. The whole number of newspapers and periodicals was 599, having an aggregate circulation of 1,692,124, and issuing annually 129,001,206 copies. There were 21 daily, with a circulation of 231,625; 1 tri-weekly, 800; 16 semi-weekly, 41,484; 158 weekly, 699,465; 11 semi-monthly, 45,200; 48 monthly, 462,150; 9 quarterly, 11,400; and 1 annual, 3,000. In 1874 the total number was reported at 321, including 26 daily, 1 tri-weekly, 10 semi-weekly, 212 weekly, 4 bi-weekly, 2 semi-monthly, 55 monthly, and 1 bi-monthly.—The total number of religious organizations was 1,848, having 1,764 edifices, with 882,317 sittings, and property valued at $24,488,285. The denominations were represented as follows:

</table>

—The first settlement in Massachusetts was made on the Elizabeth islands in 1602 by Bartholomew Gosnold and 32 English colonists; but it was soon abandoned. Other expeditions visited the coast for the purpose of getting possession of the country, but with unimportant results. On Sept. 6, 1620 (O. S.), about 100 English who had sought religious liberty in Holland, having embarked from Delft Haven, set sail from Plymouth, England, in the Mayflower, of 180 tons, for the purpose of settling in America. They had made terms with the Virginia company, which had received from the crown important privileges in America. They reached Cape Cod Nov. 9, and anchored in the roadstead of the present Provincetown. Before landing they drew up and subscribed a solemn compact or constitution, by the terms of which they were to be ruled; and immediately after John Carver was elected governor for one year. An exploring party spent some days in searching for a favorable place to begin the settlement, and they at last landed at Plymouth, Dec. 11 (O. S.). Here the severity of the weather, exposure, and bad food brought on sickness, which reduced their number nearly one half in about four months. Three months after landing they made a treaty of amity with the Indian chief Massasoit and his people, with whom they long remained friends. With other chiefs and tribes there had occasional disputes and skirmishes, but they were soon freed from serious molestation. In these matters Capt. Miles Standish achieved great reputation. In the spring the Mayflower departed, and shortly after Carver died, and was succeeded by William Bradford, with Isaac Allerton as his assistant. Until 1623, when
they had a plentiful harvest, the colony endured many privations, and were often near famishing. In that year some changes were made in the system of labor, and the plan of common property was abandoned. During this time the colony received accessions from abroad, and other settlements were attempted. A new patent was obtained in 1622 by Mr. Weston of London, formerly connected with the Plymouth colonists, under which he despatched an expedition to settle for him a plantation in Massachusetts bay. They were hospitably received at Plymouth, and commenced a plantation at Wessagusset, now Weymouth. All efforts to obtain a patent from the crown were unavailing, and the Plymouth colonists were thus obliged to carry on their government without the royal sanction. They quietly assumed all the necessary powers and discharged all the duties of the state. A governor, with a council at first of five and afterward of seven assistants, and a legislature consisting at first of the “whole body of the male inhabitants,” made and administered the laws by which the state was ruled. In 1628 an expedition commanded by John Endicott reached Salem, having been organized by an English company which had obtained a grant of territory lying between the Atlantic and the Pacific, and extending 3 m. S. of the river Charles and Massachusetts bay and 3 m. N. of every part of the river Merrimack. Endicott's safe arrival excited renewed interest, new associates joined, and a royal patent was at last obtained for the company of the Massachusetts Bay. The charter established a corporation, and the associates were constituted a body politic. Its officers were a governor, deputy, and 18 assistants, to be annually elected. A general assembly of the freemen, to be held four times a year or oftener if required, was intrusted with legislative powers. The question of religious liberty was avoided in the instrument, but the making of laws contrary to those of England was strictly forbidden. In 1629 a reenforcement was despatched, consisting of 300 men, 80 women, and 26 children, with victuals, arms, tools, cattle, and goats; and in the same year it was determined to transfer the government and patent of the company from London to New England. The old officers resigned, and new officers were appointed from among those who intended to emigrate, John Winthrop being made governor. A new emigration was thus promulged, and soon the colony received an accession of about 1,000 persons, who had been conveyed in 17 vessels. Sites for settlements were promptly selected; and the names of Charlestown, Boston, Watertown, Dorchester, Roxbury, Salem, Mystic, Saugus (Lynn), and others, occur in the history of this period. This colony suffered great hardships. Many died, and others returned disheartened to England. The Massachusetts company continued to receive additions from England, and in the exercise of their political and religious privileges manifested a jealous and vigilant interest. Intolerance led to the banishment of Roger Williams and Anne Hutchinson in the early years of the settlement, as it did later to the persecution of the Quakers. Issues were made between the magistrates and people on the construction of the charter in reference to legislation and representation, the mode of voting was changed from the show of hands to the ballot, and a law against arbitrary taxation was passed, while from 1644 to 1645 a dispute continued concerning the relative powers of the assistants and deputies. The Massachusetts colonists for four years after their settlement had been left to bear their burdens and work out their own way without the interference of England. But the increasing emigration from the latter country, and a suspicion on the part of the crown that the colony desired to be independent, led to an attempt to annul the charter, and the appointment of a special commission for its government, at the head of which was Archbishop Laud. The colony refused; and they evaded, to deliver up their charter, and at a meeting of the general court measures were taken for the fortification of Boston harbor, Charlestown, and Dorchester, and arrangements were made for drilling troops. The political agitation of the mother country preserved the colony from the dangers which threatened her from that quarter. A disturbance with the Pequots led to the Pequot war (1637), the brunt of which was borne by the settlers in Connecticut. On the restoration of the Stuarts, new troubles threatened Massachusetts. Its protest against the injustice of being subject to the laws of parliament, acquiesced in by the long parliament, was disregarded by the judges under the restoration, and it was declared to be under the legislative supremacy of parliament without restriction. The colony had addressed the king on his return, praying for the continuance of civil and religious liberties; and Leverett, the agent in London, was urged to support their application. Much controversy ensued, and at length in 1662 a commission sent to England obtained a confirmation of the charter from the king, and a conditional promise of an amnesty for all offences during the late troubles; but the king maintained his right to interfere in the domestic concerns of the colony, demanded the repeal of all laws derogatory to his authority, the taking of the oath of allegiance, the administration of justice in his name, the complete toleration of the church of England, and a concession of the elective franchise to every inhabitant possessing a competent estate. These demands were strongly opposed by one portion of the community, while the other was willing to yield for the sake of quiet. Commissioners charged to investigate the affairs of the colony arrived in 1664. Massachusetts published an order prohibiting complaints to them, and a remonstrance was addressed to the king. After an
unsuccessful attempt to carry out the purposes 
of their mission, the commissioners went into 
Maine, and were subsequently recalled. Mas-
sachusetts was reproved by the king, while 
Bellingham, the governor, Hawthorne, and two 
or three others were commanded to appear in 
England, but refused. The prosperity of the 
colonies received a severe check in the war 
with the Indians, called King Philip's war, 
which commenced in 1675, and on the part of 
the savages was one of desperation. During 
this war, which lasted till the latter part of 
1676, and was terminated by the death of 
Philip, 12 or 13 towns were destroyed, more 
than 600 of the colonists perished in the field, 
and about 600 houses were burned. Of the 
men 1 in 20 had fallen, and of the families 1 in 
20 was houseless, while the expenses reached 
the enormous sum for that day of $500,000. 
Though the war had been conducted without 
assistance from England, it had hardly ceased 
when an emissary from that country, Edward 
Randolph, arrived. His pretensions were dis-
allowed, and he returned to excite further hos-
tility against Massachusetts. A committee of 
the privy council, at the suit of Mason and 
Gorges, subsequently denied her right of juris-
diction over Maine and New Hampshire, which 
thus became separated; but the title to Maine 
was purchased and retained by Massachusetts 
until 1820. Notwithstanding many conces-
sions, the colony failed to effect a reconcilia-
tion with the king. In 1684 the high court 
of chancery in England gave judgment for 
the crown against the governor and company 
of Massachusetts, and their charter was de-
clared forfeited. Joseph Dudley was appoint-
ed president of Massachusetts, the general court 
was dissolved, and the new commission su-
perseded the government under the charter. 
On Dec. 20, 1686, Dudley was superseded by 
Sir Edmund Andros. The new governor and 
his council, in the most arbitrary and illegal 
manner, proceeded to make laws and levy tax-
es; and this tyrannous rule was submitted to, 
not without protest and opposition, for more 
than two years. In April, 1689, reports hav-
ing been received of the flight of James and 
the accession of William and Mary, on a rumor 
of an intended massacre by the governor's 
guards, the men of Boston, aided by others 
from the country, rose in arms, imprisoned 
Andros and others who were obnoxious, and 
reinstated the old magistrates. Next day 
crowds from the country came pouring in; the 
people took the castle and the frigate Rose, 
and occupied the fortifications; town meetings 
were held, representatives chosen, and the 
general court was restored. The same spirit 
prevailed at Plymouth; Clark, the agent of 
Andros, was imprisoned, and Hinckley, the 
former governor, reinstated. Massachusetts 
took part in 1690 in the intercolonial war be-
tween the possessions of France and England. 
A fleet under Sir William Phips captured and 
plundered Port Royal. An expedition to Can-
da failed, and the colony, being unable to pay 
the troops, issued treasury notes, the first pa-
per money seen in the colonies. A new char-
Cer was given in 1692, by which Plymouth was 
United to Massachusetts. At this period Mas-
sachusetts contained a population of about 40,- 
000. It was divided into the counties of Suf-
folk, Essex, Middlesex, and Hampshire, and 
comprised 55 towns. Plymouth, with a popu-
lation of about 7,000, was divided into the 
counties of Plymouth, Bristol, and Barnstable, 
and comprised 17 towns. Under the new char-
ter, the governor, lieutenant governor, and sec-
retary were appointed by the king. No act of 
the legislature was to be valid without the con-
sent of the governor, and he had other impor-
tant negative as well as positive powers. Sir 
William Phips was appointed first governor. 
At about this period occurred the witchcraft 
delusion. (See Salem.) In 1703-'4 the prov-
ce suffered from the French and Indians, 
who attacked and burned Deerfield, which had 
been rebuilt since King Philip's war. In 1722 
war was resumed with the Indians, and con-
tinued until the latter part of 1729, when the 
troubles with them were terminated. War 
having been declared between England and 
France in 1744, the colonial possessions were 
at once involved. Massachusetts contributed 
largely to the expedition which captured Loui-
sburg in 1746, and exerted her best energies 
in the plans for the conquest of Canada and 
other military operations until the conclusion 
of peace in 1748. In a few years war again 
came and commenced, and the province once more gave 
hers sons and her wealth to the cause of the 
parent country. The passage of the stamp 
act aroused the wildest excitement, and its re-
peal the following year was welcomed with 
the most extravagant demonstrations of joy. 
Further plans for revenue were then proposed 
by the home government, which also refused to 
withdraw its troops. The arrival of the 
Romney man-of-war renewed the excitement, 
and Massachusetts issued another circular letter 
to the colonies which the ministry in vain com-
maded them to rescind. The Boston massa-
cer in 1770, the destruction of the tea in 1773, 
the port bill in 1774, are notable incidents pre-
seding the revolution. The province was well 
represented in the general congress, and the 
men of Massachusetts were alive to every act 
of aggression. They took possession of the 
arenal at Charlestown, and prepared for the 
approaching struggle. The assembly adjourn-
ed to Concord, and organized as a provincial 
congress. At Lexington and Concord Massa-
chusetts made the final appeal to arms. Throughout the revolutionary war Massachu-
setts sustained her former reputation for patri-
ottism and public spirit, and the details of her 
history at this period will be found in the ac-
counts of those places within her borders which 
are of historical interest. The population of 
Massachusetts has been estimated at 200,000 
in 1750; 220,000, exclusive of slaves, in 1755;
241,000, including 5,200 slaves, in 1763; and 382,000 in 1775. In 1780 a constitution was framed for the state, which was submitted to the vote of the people and adopted. It is still the supreme law of the state, though several times amended. By a clause in the bill of rights prefixed to it, slavery was soon decided to have been abolished. John Hancock was elected first governor. Six years later, in 1786, civil disturbances commenced in the centre and west of the state, caused by the poverty and distress of a great portion of the people, and the heavy taxes necessary to pay the state debt. An insurrection known as Shays's rebellion from the name of its principal leader, Daniel Shays, broke out, and was not suppressed without bloodshed. The federal constitution was ratified by a state convention, which met in Boston, Jan. 9, 1788, and gave its assent by a vote of 187 to 168. After the formation of the government Massachusetts adhered generally to the federal party, and was foremost among the states opposed to the war with England in 1812, though she furnished great numbers of seamen to the navy. In 1814 she sent delegates to the convention of the New England states which met at Hartford to confer upon the subject of grievances, and to take such measures for relief as were "not repugnant to their obligations as members of the Union." Of that convention George Cabot of Massachusetts was president. In 1820 a convention to revise the constitution proposed various amendments, nine of which were ratified by the popular vote. In the same year the district of Maine was separated from Massachusetts, with the consent of the latter, and erected into a state. In 1857 amendments of the constitution were made, by which the district system of choosing representatives and senators to the state legislature was adopted, in place of the apportionment by towns and counties. During the civil war Massachusetts furnished to the army and navy 159,165 troops, or 181,116 reduced to the three years' standard, the latter being a surplus of 13,492 over all calls by the general government. The losses included 3,749 killed in action, 9,086 who died from wounds or disease, 15,645 discharged for disability contracted in service, and 5,866 not accounted for, of which at least one half were probably deaths. The total expenditures by the state on account of the war were $54,162,200. Since the close of the war a militia force of about 6,000 men has been maintained, at an average annual expense of $175,000.

MASSACHUSETTS INDIANS. At the time of the English settlement of Massachusetts the territory was occupied by five Algonquin tribes. The Penacooks were in the northeast, partly in what is now New Hampshire; the Pequot, on the bay of that name; the Nausets on Cape Cod; and west of them the Pokanokets or Wampanoags in the southeast. Central Massachusetts was occupied by the Nipmucks or Nipnets; the western part was uninhabited. All of these tribes were friendly except the Nausets, who had had frequent collisions with the crews of French and English ships. The Plymouth settlers effected a peace with the Nausets, and made a treaty with Massasoit, chief of the Pokanokets. (See MASSASOIT.) The Massachusetts colony entered into similar relations with the Massachusetts and Pennacooks. In 1644 the Mayhews on Martha's Vineyard, and in 1646 John Eliot, began missions to the Indians; and in 1651 Eliot's converts were formed into a community at Natucket. For their use he translated the Bible into their language (New Testament, Cambridge, Mass., 1661; whole Bible, 1668). By 1674 the praying Indians or converts numbered 3,200, of whom 1,100 were in Massachusetts, 600 in Plymouth, and 1,500 in Martha's Vineyard. A growing discontent among the Indians culminated in 1675 in what is known as King Philip's Indian war. It began with the rising of the Pokanokets under Philip Metacomet or Pometacom, son of Massasoit; the Nipmucks followed, then the Narragansetts, and finally the Pennacooks. Though not apparently a concerted plot, the rising was almost simultaneous, and all the Massachusetts frontier settlements were ravaged. Even the praying Indians caught the contagion, and numbers joined the enemy. The colonists finally conquered the savages, and the war ended with the death of Philip, Aug. 12, 1676. The Pennacooks after this withdrew in a great measure, joining tribes to the east or in Canada. The other tribes quieted down, having lost heavily, and many having been sent off to the West Indies as slaves. From time to time lands were assigned to the declining communities, and the Indians have gradually mingled with negroes and whites. A careful census in 1861 showed an aggregate of 305 Indians or half-breeds in the state: 306 on Martha's Vineyard, at Christian town, and Gayhead; 438 at Marshpee and Herring Pond, Cape Cod; 12 at Natucket; the rest being the Pankapog, Fall River, Hassamamiscoe, Dudley, Yarmouth, Dartmouth, Mamattakeeset, Tumpum, Deep Bottom, and Middleborough bands, with some stray parties. Since then the tendency has been to assimilate them with the rest of the population. In the United States census of 1870 only 151 Indians are returned from Massachusetts, the rest being counted as white or negro. — For the study of the Massachusetts dialect of the Algonquin, materials are supplied by Eliot's "Indian Grammar Begun" (Cambridge, 1664; Boston, 1832), and "Indian Primer" (Boston, 1720); Cotton's "Vocabulary of the Massachusetts Language" (Cambridge, 1830); and the elaborate studies of Eliot's Bible made by J. Hammond Trumbull, published as yet only in fragments. MASSAGETE, an ancient nomad people of Asia, who dwelt on the steppes adjoining the Jaxartes or Sir Darya and the sea of Aral, and according to some extended further S. E.
They were regarded as Scyths, and were reputed warlike. They worshipped the sun, to which they sacrificed horses. Their very old people were also sacrificed, according to Greek accounts, and the flesh eaten. They raised no grain, but kept cattle and lived largely on fish. Cyrus, the Persian conqueror, is said to have fallen in an expedition against them, when they were commanded by their queen Tomyris. Some critics identify them with the Meshech in the Scriptures.

MASSARUNI, a river of British Guiana, rising about lat. 4° 30' N., lon. 59° 30' W., and holding an extremely circuitous course, first westward, then N. about 70 m., and finally N. and N. N. E., to the extreme southerly point of the estuary of the Essequibo, in which it merges. In lat. 5° 50' N. it receives the waters of the Rupununi and becomes a wide and majestic stream. It has numerous islands. It has been explored by Hillhouse to a distance of 400 m. from its junction with the Essequibo. The navigation of the upper portion is difficult, owing to the frequent rapids and cascades. The river is celebrated as having long been supposed by geographers to form a part of the fabulous lake of Parime.

MASSASOIT, a sachem of the Wampanoags, died in the autumn of 1661, about 80 years of age. His dominions extended over nearly all the southern part of Massachusetts, from Cape Cod to Narragansett bay; but his tribe, once estimated at 50,000 in number, had shortly before the landing of the pilgrims at Plymouth been reduced by a disease supposed to have yellow fever to about 300. On March 22, 1631, three months after the founding of Plymouth, he appeared there with 60 warriors, armed and painted, for the purpose of forming a friendly league with the white men. Although the tribe were reputed cruel and treacherous, the very open and friendly greeting of Massasoit so favorably impressed Gov. Carver, that after the necessary and imposing formalities were concluded, he formed in behalf of the colony a treaty of peace and mutual protection with the Wampanoags, which for 50 years was sacreddly kept. The friendly disposition of Massasoit toward the colonists never relaxed. His residence was within the limits of what is now the town of Warren, R. I., near an abundant spring of water, which still bears his name. Roger Williams, when banished from the Massachusetts colony, on his way to Providence, was entertained by him for several weeks at this place. Massasoit was humane and honest, never violated his word, and constantly endeavored to imbue his people with a love of peace. He kept the pilgrims advised of any warlike designs toward them by other tribes. In person, says Morton in his "Memorial," he was "a very lusty man in his best years, an able body, grave of comtenance, and spare of speech." His family consisted of his wife, two brothers, three sons, a daughter, two sons' wives, and a grandson. His two eldest sons were named Mooanum and Pometacom. Soon after the death of Massasoit these sons went to Plymouth and requested the pilgrims to give them English names. The court named them Alexander and Philip. The former became chief sachem, died within a year, and was succeeded by Philip.

M. ASSÉ, Gabriel, a French jurist, born in Poi- tiers in 1807. He was called to the bar in Paris in 1858, and in 1868 became councillor of the court of cassation, and also one of the chief editors of the Recueil des Arrêts. In 1874 he succeeded Odilon Barrot in the acade- my of moral and political sciences. With De Villeneuve he has published Dictionnaire du contentieux commercial (2 vols., Paris, 1889-’45; 2d ed., 1851), and is the sole author of Le droit commercial dans ses rapports avec le droit des gens et le droit civil (6 vols., 1844–8; 2d ed., revised and enlarged, 4 vols., 1861–8). With Charles Vergé he translated from the German into French with annotations, under the title Le droit civil français, the Handbuch des französischen Civilrechts, by Karl Salomo Zachariä von Lingenthal (5 vols., Paris, 1854–9).

MASSENA, a town and village of St. Law- rence co., New York, 170 m. N. N. W. of Al- bany; pop. of the town in 1870, 2,560; of the village, 488. The town borders on the St. Lawrence river, and is intersected by the Grass and Raquette rivers, which afford good water power. The village is situated on Grass river, and about a mile S. E. on the W. bank of the Raquette are the Massena springs. These are saline and sulphurous, and are much resorted to in summer.

M. ASSÉNDA, André, prince of Essling, a marshal of France, born in Nice in May, 1758, died in Paris, April 4, 1817. It has been said that he was of Jewish origin, and that his real name was Manasseh. In early life he was a sailor, and subsequently entered the royal Italian regiment in the Sardinian service, in which he served 14 years without rising above the grade of sergeant. On the annexation of Nice to the French republic in 1792 he resumed the profession of arms, was appointed adjutant major and soon after colonel, and by the end of 1798 had attained the rank of gen- eral of division. His tactical skill in the Italian campaigns of 1794–5 attracted attention, and in 1796 Bonaparte gave him the command of the advanced guard of the army of Italy. At Montenotte, Milleisino, Castiglione, Arcolé, and Rivoli, Masséna distinguished himself, and Napoleon surnamed him the "favored child of victory." In February, 1798, he was sent to replace Berthier in the Papal States; but the appointment proving unpopular among the troops and the people on account of his char- acter for rapacity and avarice, he soon re- signed. In the succeeding campaign his op- erations against the allied Austrian and Russian armies in Switzerland were attended with brilliant success, and the decisive defeat in- flicted by him on the Russian general Korsa-
koff at Zürich, Sept. 25, 1799, saved France from invasion. Directed by Bonaparte to defend Genoa, which was invested by an Austrian army and blockaded by a British fleet under Lord Keith, he sustained a memorable siege of more than three months, and only surrendered (June 8, 1800) when the inhabitants, reduced to desperation by hunger, threatened to rise against him. The concentration of a large Austrian force at this point, however, greatly aided Bonaparte in gaining the important battle of Marengo, fought eleven days after the capitulation of Genoa. Attached from interested motives to the republic, Masséna opposed the establishment of the empire; but his services were deemed by Napoleon too valuable to be dispensed with, and in 1804 he was created a marshal. During the campaign of 1805 he commanded an army of 50,000 men in Italy, where skilful manœuvres he occupied the attention of the archduke Charles until Napoleon had gained the decisive victory of Austerlitz; and in 1806 he completed the conquest of Naples and established Joseph Bonaparte on the throne of that kingdom. In the campaign of 1809 he commanded the fourth corps of the army. In the battles of Aspern and Essling his firmness saved the retreating French forces from destruction; and the title of prince of Essling was bestowed on him by Napoleon. At the battle of Wagram, where he commanded the left wing, he was obliged, in consequence of a recent injury, to direct the movements of his troops from a carriage. Seeing his men waver at a critical moment, he caused himself to be placed on horseback, and had scarcely changed his position when a cannon ball struck the seat he had been occupying. In 1810 he was appointed chief in command of the army of Portugal, with orders to drive the British troops from the peninsula. Crossing the Mondego in the middle of September with 70,000 men, he followed Wellington to the neighborhood of Lisbon, where his progress was arrested by the famous lines of Torres Vedras. He accordingly fell back to Santarem until his army was greatly weakened by sickness and scarcity of supplies, he commenced on March 5, 1811, his celebrated retreat into Spain, “in which,” says Napior, “he displayed infinite ability, but withal a harsh and ruthless spirit.” In the latter part of April he entered Salamanca, having lost 30,000 men within six months; on May 5 he fought the bloody but indecisive battle of Fuentes de Oñoro; and soon after he was obliged on account of ill health to resign his command and return to France. During the whole campaign he had been a confirmed invalid, and to his inability to reconnoitre personally Napoleon ascribed the ill result of his operations. After the restoration of his health he held the comparatively inactive post of commander of the eighth military division of the empire. He gave in his adherence to the Bourbons at the restoration, and during the hundred days took no part in public affairs. — In military capacity Masséna ranks with the first generals of the empire, although it was said that he never began to act with judgment until the battle was going against him. His character was stained by imputations of meanness and rapacity, which took definite form in a series of accusations brought against him by the inhabitants of Marseille. Napoleon called him a “robber,” and offered him a present of 1,000,000 francs if he would discontinue his peculations. He paid little attention to discipline or to the comfort of his troops, by whom he was cordially disliked.

MASSEY, Gerald, an English poet, born near Tring, Hertfordshire, May 29, 1838. He was the child of an illiterate couple, who lived in the most abject poverty; and his whole education was confined to a few months at school. At eight years of age he was sent to work in a neighboring silk mill, and was afterward employed in straw plaiting. He read whatever books were accessible to him, and at the age of 15, when he went to London to seek employment as an errand boy, had made himself familiar with the Bible, “Pilgrim’s Progress,” “Robinson Crusoe,” and a few Wesleyan tracts. At the age of 17 he fell in love, and at the same time began to write verses. Some of his early poems, dwelling upon the sufferings of the poor, and the “power of knowledge, virtue, and temperance to elevate them,” appeared in a provincial journal; and a collection of them was published in his native town under the title of “Poems and Chansons.” The French revolution of 1848 “had the greatest effect on him of any circumstances connected with his life.” He started in conjunction with some fellow working men, in April, 1849, a cheap ultra-radical weekly newspaper called the “Spirit of Freedom.” This brought him into some prominence among people of his class, and he aided the Rev. F. D. Maurice and the Rev. Charles Kingsley in their plans for cooperative labor by means of workingmen’s associations. About the same time he married, and his poems, published occasionally in the London journals, began to attract notice. He has lectured extensively on spiritualism (in which he is a believer) and literary topics in Great Britain, and in 1873 in the United States. In 1863 he received a pension on the civil list. He resides in a rustic cottage in his native county, presented to him by Lord Brownlow. He has published “The Ballad of Babe Christabel and other Poems” (1853); “Craigierook Castle” (1856); “Robert Burns, and other Lyrics” (1859); “Voices of Freedom and Lyrics of Love” (1859); “Havelock’s March, and other Poems” (1861); “Shakespeare’s Sonnets never before Interpreted” (1866); and “A Tale of Eternity, and other Poems” (1870).
MASSILLA. See Marseille.

MASSILLON, a city of Stark co., Ohio, on the Tuscawaras river and the Ohio canal, at the intersection of the Pittsburgh, Fort Wayne, and Chicago, the Lake Shore and Tuscawaras Valley, and the Massillon and Cleveland railroads, 95 m. N. E. of Columbus, and 50 m. S. of Cleveland; pop. in 1860, 3,819; in 1870, 5,185; in 1874, estimated by local authorities at 7,000. It is regularly laid out, is substantially and compactly built, and contains many handsome residences, and an opera house costing $100,000. It is surrounded by one of the most productive coal fields of the state, and the coal obtained here has a wide reputation. The Massillon white sandstone, which is largely quarried, is shipped to all parts of the country. Large shipments of iron ore, wool, flour, grain, &c., are also made. There are two blast furnaces, a rolling mill, foundries and machine shops, and manufactories of agricultural implements, iron bridges, and boilers. The city contains three banking houses, two large union school houses, a primary school building, a charity school, two weekly newspapers, a library belonging to the young men's Christian association, and nine churches. It was laid out in 1826.

MASSILLON, Jean Baptiste, a French prelate, born at Hyères, Provence, June 24, 1663, died Sept. 16, 1742. He studied with brilliant success under the Oratorians in his native city, and entered their congregation in 1681. In the monastery of Sept-Fonts he was appointed to reply to the charge of the cardinal de Noailles, which office he fulfilled with remarkable brilliancy and unction; and from that time his talents and culture were directed toward the pulpit. He had been a professor successively at Pézénas, Montbrison, and Vienne, and had gained distinction by several funeral orations, especially by that on Henri de Villars, when in 1690 he was called to Paris to take charge of the seminary of St. Magloire. His sermons soon made him the rival of Bourdaloue, whom in 1698 he succeeded in a mission to Montpellier. In 1699 he preached during Lent in the church of the Oratory at Paris, where Bourdaloue was one of his listeners; and he delivered before the court at Versailles an Advent sermon which condemned Louis XIV. to say to him: "I have heard many great orators, and been satisfied with them; but when you spoke, I was very dissatisfied with myself." His sermon on the small number of the elect was delivered for the first time at St. Eustache, and with so great effect that the entire audience rose during the peroration, "as if looking for the archangel to sound." In 1704 he preached a second time at court. He preached the funeral sermon of the prince of Conti in 1709, of the dauphin in 1711, and of the king in 1715. In 1717 he was appointed bishop of Clermont, and was invited to preach during Lent before the young king. The ten sermons, entitled Petit carême, which he composed for this occasion, are among his masterpieces, and are esteemed models of French prose and eloquence. From this time the orator gave place to the bishop, and he rarely left his diocese. In 1719 he was received into the French academy, and in 1723 he preached at St. Denis the funeral sermon of the duchess of Orleans. He was noted for zeal, charity, and liberality. As the tendencies of the 18th century began to manifest themselves, his eloquence, without ceasing to be that of a divine, became more and more that of a moralist and philosopher. His complete works were published by his nephew (14 vols., 1745-6). Subsequent editions were substantially reprints of this, and differed in many respects from the original manuscripts. A better edition, conformable to the manuscripts and containing many unpublished writings and new biographical researches, was published by the abbé E. A. Bampion, with a portrait (3 vols. 4to, Bar-le-Duc, 1865-7). His Œuvres before the academy was written by D'Alembert.

MASSINGBERD, Francis Charles, an English clergyman, born in Lincolnshire in 1800, died at South Ormsby, in that county, in December, 1872. He graduated at Magdalen college, Oxford, in 1822, took orders, and became rector of South Ormsby in 1825. In 1847 he became a prebendary of Lincoln, and in 1862 was appointed chancellor of the cathedral. For many years he was zealously occupied in the effort to revive the active powers of the convocation in the church of England. His principal publications are: "History of the English Reformation" (3d ed., 1857); "Law of the Church and State" (1857); and "Lectures on the Prayer Book" (1864). He also published several letters and pamphlets.

MASSINGER, Philip, an English dramatist, born in Salisbury in 1584, died in London, March 17, 1640. His father was a retainer of the earl of Pembroke. In 1602 Philip was entered at St. Alban's hall, Oxford. According to Anthony a Wood, he occupied himself with poetry and romances instead of logic and philosophy, left the university without receiving a degree, and went to London in 1606. Little is known of his life till the publication of his earliest drama, "The Virgin Martyr," in 1622. His name occurs in Henslowe's diary in 1614, in connection with two actors and dramatic authors, and from 1613 he was engaged as joint author with Fletcher, Field, and others. Most of his 18 extant plays were produced in the 10 years following 1622; "The Bashful Lover," the latest of them, was written in 1636. His health seems to have suffered from his laborious career, and his obscurity and lonely death appear from the register of his interment: "March 20, 1639-40, buried Philip Massinger, a stranger." Five of his extant plays are tragedies; the remainder may be termed tragi-comedies. His most striking excellences are in the conception of character, in dignity of sentiment, and in grace and mel-
od of style. "The Duke of Milan" is one of the best of his tragedies; "The Picture," "A Very Woman," "A City Madam," and "A New Way to Pay Old Debts," are among his best tragi-comedies. The last alone retains a place on the stage, for which it is indebted to its effective delineation of the character of Sir Giles Overreach. The best edition of his works is that by W. Gifford (4 vols., London, 1805; new eds., 1813 and 1850). His plays, with those of Ford, and with an introduction by Hartley Coleridge, were published in 1848.

MASSINISSA. See MASSISSA.

MASSON, David, a Scottish author, born in Aberdeen, Dec. 2, 1822. He was educated at Marischal college, Aberdeen, and at the university of Edinburgh, and at 19 became editor of a Scottish provincial newspaper. Two years later he went to London, and became a contributor to the magazines, subsequently spent several years in Edinburgh in a similar capacity, and about 1847 established himself again in London. In 1852 he was appointed professor of the English language and literature in University college, London, and in 1865 of rhetoric and English literature in the university of Edinburgh. He has published "Essays, Biographical and Critical, chiefly on English Poets" (1856); "Life of John Milton" (2 vols., 1859-71); "British Novelists and their Styles" (1859); "Recent British Philosophy, including Remarks on Mr. Mill's Answer to Sir William Hamilton" (1865); "Essays on Wordsworth, Shelley, Keats" (1874); and "Chatterton" (1874). From 1859 to 1868 he was editor of "Macmillan's Magazine."

MASSOWAII, or Massowah, a seaport town belonging to Egypt, on an island in the Red sea, in the bay of Massowah, 250 m. N. E. of Gondar, and 420 m. N. W. of Aden; lat. 15° 36' N., lon. 39° 21' E.; pop. about 6,000. The island is a barren rock about 1/4 m. long, and from 300 to 400 yards broad. The harbor is deep, sheltered, and safe, and can accommodate about 50 vessels. The inhabitants have no water, save what they can collect in tanks. In 1859 the French acquired the port of Zula, about 25 m. S. of Massowah. Owing to the increasing commerce with Abyssinia and Darfour, Massowah has of late become of great importance. Since 1865 it has been the seat of an Egyptian governor, subordinate to the governor general of Soudan. In 1874 this office was held by the Swiss traveller Werner Munzinger.

MAST AND SERVANT. The word servant (Lat. servus) is a generic term embracing all persons bound or obligated to render service to others, and therefore including slaves; but where slavery does not exist, a servant is understood to be one who by contract has bound himself to render service to another, who in respect to the subject matter of the contract is his master. The law of England distinguishes domestic from other servants, and presumes a hiring when no time is specified to be for a year; but in the United States this distinction is not recognized. The contract of hiring may be verbal or in writing; if it be for more than a year, it must be in writing, or it will be valid only so far as the parties have acted under it. When the time of service is fixed, neither party was a right to terminate the contract except for cause; and what would be sufficient excuse is sometimes a question of difficulty. The master, if it is part of the contract that the servant shall reside with him, is bound to provide suitably for his wants, though not to furnish him medical attendance or medicine in case of sickness; and ill treatment or blows inflicted upon him are a breach of the implied terms of the contract. On the other hand, the servant must obey all proper directions of the master in respect to the service, must attend faithfully to his duties, and be guilty of no grossly immoral or indecent behavior. The penalty if the servant shall leave the service without sufficient cause, or if the master shall wrongfully discharge him, is the payment of such damages as the other party can show he has sustained; and it is generally held that, as such a contract is an entirety, either party violating it can have no remedy against the other, but on the contrary will be liable to the other for a failure to perform it on his part for the whole period. But where no time is limited by the contract of service, either party may terminate it at his option, except perhaps that where the compensation is to be made by the week, month, or year, a strong if not conclusive inference might arise that the hiring at the outset was for one of these terms, and for another if the service continued after one had expired, and so on. An apprentice is a servant, but subject to some peculiar rules. (See APPRENTICE.) Stewards, factors, and bailiffs are also considered as servants pro tempore; and for some purposes any one who assists another in his business, though only as a matter of kindness or favor, is by the law placed in the same category. The most important of these purposes is the protection of third persons who may be injured, or the wrongful act of the person thus in the service of another. The rules of liability in these cases may be thus stated. Where a wrongful act is done by a servant by direction of the master, or in his presence so that his consent may fairly be implied, or as the natural or probable result of directions given by the master, or in the exercise of a discretion which the master has given, the master is answerable in damages to the person injured. So if the servant in the course of his employment conducts himself so negligently, or manages the business with such want of skill or prudence, as to cause an injury to another, the master must respond therefor. These rules, however, do not make the master liable for anything done or omitted by the servant when not acting in his service, or under his express or implied command; but if the servant steps aside from his duty to commit an intentional wrong, he alone is liable there-
for. But this rule is subject to an apparent exception in the case of carriers of passengers. Where, for instance, a railway company receives passengers to be carried, and intrusts them to the care of its conductors and other servants, if the conductor of a train shall cause a passenger who is in no default to be put off the cars, the company will not only be liable in that case upon the presumption that the conductor was acting in obedience to its orders, but it would also be liable if the conductor should in defiance of orders and wilfully and wantonly inflict an injury upon the passenger, because it was the duty of the company to see to it that the contract of carriage be not intrusted for execution to those who would either negligently or purposely violate it. It should be observed in respect to these rules of liability on the part of the master, that they do not apply in favor of one of his servants who is injured by the carelessness or negligence of a co-servant, but the servant is considered to have taken upon himself by the contract of hiring all risks of that character; though if he can show that the servant causing the injury was an incompetent or unfit person to be engaged in such employment, and that the master knew it when he employed him, thereby tracing the negligence back to the master, he may hold the latter responsible. One class of persons who make it their business to perform service for others are not held to be servants so far as to make the master liable for their negligent torts. These are such as act in an independent employment, and not under the immediate control, direction, or supervision of the employer. The man who draws goods for me by the day or week is my servant, but the railway company that transports them is not, neither is the licensed drayman.—Corresponding to his liabilities to third persons, the master has some rights. One who entices his servant away from him before his time of service has expired, or who injures him so that he cannot labor, or who seduces his female servant, is liable to him in damages; and in the last mentioned case heavy puratory damages are sometimes allowed to be recovered. The courts consider any female a servant who is living with and performing service, however slight, for another, whether under contract or not; and a father, at the common law, only recovers for the seduction of his daughter on the ground of her being his servant. In general, where a third person has a right to hold the master liable for the servant’s act or non-facance, he may at his option hold the servant also; and on the other hand, though the master may sue for an injury to the servant whereby he has lost his service, so the servant may have an action on his own account to recover the damages which are personal to himself. It should be observed that, though the officers of a corporation are regarded as its servants, yet the chief executive officer or superintendent of its business is for many purposes, so far as third persons are concerned, regarded as standing in the place of and representing its principal for the purposes of control and direction of other officers and servants; and the liability of the corporation will be the same for acts done under his direction as though done by direction of the corporate board of management.

**Masts (Ger. Meistersinger)**, a class of minstrels who flourished in Germany during the 14th, 16th, and 16th centuries. They were generally of burgher extraction, and in the reign of the emperor Charles IV, were formed into regular corporations, for admission to which a course of apprenticeship was required. Their chief seats were the imperial cities, and they flourished most at Nuremberg. The compositions of the members, consisting chiefly of devotional and Scriptural pieces, were subjected to a peculiar code of laws, and the main faults to be avoided, 32 in number, were distinguished by particular names. At public contests in Nuremberg, a board of four judges, called Merker, sat to hear the poems recited or sung, and mark the faults in each. The first compared the recitation with the text of the Bible lying before him, the second criticised the prosody, the third the rhymes, and the fourth the tunes. He who had the fewest marks received the prize, and the successful competitors were thereupon permitted to receive apprentices. These corporations began to decline in the 17th century, and have been succeeded in modern times by the *Liederkränze*, Sängerbände, and other singing societies. Among the most famous master singers were Hans Sachs, Musceatblüt, and Michael Behaim.

**Mastic (Gr. μαστίγος, from μασίδος, to chew or eat, so named from the practice of chewing the substance which prevailed formerly as at present in Greece), a resinous exudation from the bark of the *Pistacia lentiscus*, a shrub about 12 ft. high, found upon the borders of the upper Mediterranean. The drug is ob-

![Mastic Plant (Pistacia lentiscus).](image)
tained from the island of Seio or Chios in the Grecian archipelago, and from northern Africa and western Asia. It was known to the ancients, being correctly described by Dioscorides and Pliny, and that from Chios being particularly recommended by Galen. It is collected during July or August, when the juice slowly exuding from the tree hardens in tears on the bark, or on cloth placed to receive it, or falls upon the ground. The best quality, known as mastic in tears, consists of tears of various sizes, pale yellow, semi-transparent, roundish, oval, or flattened, and brittle. The more ordinary kind, termed mastic in sorts, is obtained in irregular masses, mixed with bark, sand, and other impurities. Mastic has a sweet resinous odor and an aromatic taste. Alcohol dissolves about 90 per cent. of it, leaving a tenacious resin that is soluble in turpentine. Chloroform, ether, and oil of turpentine are its proper solvents. By the inhabitants of the countries from which it is procured mastic is considered highly efficacious in purifying the breath and preserving the teeth, and it is extensively used for these purposes by the Turkish ladies. It is friable when first put into the mouth, but by chewing becomes soft and opaque. It is sometimes used for filling decayed teeth. Dissolved in oil of turpentine, it makes an excellent varnish used upon pictures, but of late for this and other uses it is largely superseded by the Australian resin dammar. Mastic has little medicinal effect, although it is an ingredient of a popular dinner pill composed of aloes, mastic, and red-rose leaves; the use of the mastic is to completely divide the aloes.

**MASTIFF** (*Canis urcana*), a variety of the dog family, large and powerful, with truncated muzzle and elevated skull, strong neck, muscular back, and robust limbs. The condyles of the lower jaw are above the line of the upper molars; the head is large, with the ears small and partly drooping; the tail truncated and carried erect; there is occasionally a fifth hind toe. The mastiff is calm, dignified, courageous, not easily irritated, but when angry a most determined and fierce assailant. If we seek for the original where the race is now the most numerous and in the highest perfection, it would be in the mountains of Thibet, though there is no similar wild animal in that region; the nearest wild type is the *lycaon* of the Cape of Good Hope (see Hyena), which possesses many of the characteristics of the mastiffs. The mastiff form became known to the Greeks about the time of the Macedonian conquest, and the classic Roman writers describe the pendulous lips, fiery eyes, loose folds of skin above the brows, and other characters of the modern mastiff of Thibet. The color of the Asiatic breed is generally very dark, almost black, with a few tan-colored spots about the face and limbs. The mastiff of Thibet is the largest and finest of the breed, and extends through S. and E. Tartary. The English mastiff, perhaps derived from this, but smaller and somewhat crossed with the stag and blood hounds, is more elegant in form and more majestic; the color is usually dark buff, with dark muzzle and ears; one mentioned by Hamilton Smith measured 29½ in. in height at the shoulder, and others are described as engaging singly with the lion, and able to cope with the bear and leopard. On the continent of Europe they are generally white, with large clouds of black or reddish; they have been seen 30 in. high at the shoulder. Mastiffs are very sagacious, and make excellent watch dogs.

**MASTODON** (Gr. *mastóς*, nipple, and *óδος*, tooth), an extinct proboscidian mammal, coming near the elephant, found either in the tertiary or more recent deposits in all quarters of the globe except Africa. This animal has the vaulted and cellular skull of the elephant, with large tusks in the upper jaw, and heavy form; from the characters of the nasal bones and the shortness of the head and neck, it has been concluded that it had a trunk; the crowns of the molars are divided by transverse rows of mammillar conical prominences, whence the
name; besides the upper incisors or tusks, the cheek teeth are \( \frac{2}{3} \), succeeding each other from behind forward, as in the elephant, only two or three being in use at a time; during youth there were two short and straight tusks at the end of the lower jaw in the males, which were retained sometimes to adult life. The best known species is the North American mastodon (M. giganteus, Cuv., or M. Obioteus of Falconer); this has been fully described in a superb work by Dr. John C. Warren, assisted by Dr. J. F. W. Lane ("The Mastodon Giganteus of North America," 2d ed., 4to, Boston, 1855), to which the reader is referred for the fullest details and abundant illustrations of most of the species. A few remains of the mastodon had been discovered in North America as early as 1705, but not until 1801 was anything like a complete skeleton obtained, when a tolerably complete one was procured from the morasses of Orange co., N. Y.; this was carried to London in 1802, but was soon returned to this country, where it occupied a prominent place in Peale's museum at Phila-

delphia until 1849 or 1850, when it suddenly disappeared; it was imperfect, wanting a considerable part of the head, some vertebrae, ribs, and bones of the limbs; it was believed by Dr. Warren to have fallen into the possession of Prof. Kaup of Darmstadt, Germany. Another skeleton, less perfect than the last, obtained at about the same time, was exhibited in Baltimore for years, and in a dismounted state came into the possession of Dr. Warren of Boston in 1848, where it still remains. About 1840 Mr. Koch procured a rich collection of mastodon bones from the banks of the Missouri, and put together a nondescript animal, the so-called Missourium, which drew crowds of visitors in New York and London, until from the mass of bones of several individuals a tolerably complete skeleton was made up by Prof. Owen, which is now in the British Museum. The skeleton now at Cambridge, Mass., was discovered in Warren co., N. J., in 1844; with this young female were found four very perfect heads, a number of fine teeth, and several bones. The finest skeleton of this species is the one described by Dr. Warren in the work above mentioned; it was discovered at Newburgh, N. Y., in 1845, in a swamp usually covered with water, but left dry during that summer; it is now in Boston. Specimens have been found in New York, New Jersey, Indiana, Kentucky, Alabama, Missouri, Kansas, Texas, and other states, and as far as lat. 65° N.

Taking Dr. Warren's specimen as the type of this species, the cranium is flatter than in the elephant, narrow between the temporal fossae, the face becoming twice as wide below the nasal opening; the length of the superior surface, from the vertex to the edge of the premaxillary bones, is 48 in., and the width between the superior orbital processes 28 in.; the posterior or occipital surface is nearly vertical, roughened for muscular attachments; the temporal fossae are of great size, indicating the power of the muscles which filled them; the zygomatic processes thick and strong; lower jaw V-shaped, the anterior pointed extremity having on the internal surface a long wide groove for the tongue. The cervical vertebrae have short spinous processes, except the last, which is 6\( \frac{1}{2} \) in. long; the dorsals are 20, and, with the 8 lumbar, form a considerable arch, the first 7 having very long spinous processes (that of the 3d, the longest, being 28\( \frac{1}{2} \) in.), and thence gradually diminishing to the last, which is only 4 in.; the transverse processes are also very thick in the first seven; the first lumbar measures across the transverse processes 17 in., of which the body is only 6 in.; the sacrum consists of five bones, and is 20 in. long on the lower surface; caudals probably about 22, very strong at the commencement of the tail, which reached to the knees. The pelvis is very strong and massive, 6 ft. 2 in. wide across the anterior superior spinous processes; thorax rounded, its anterior opening 2 ft. from above downward and 1 ft. transversely; sternum keeled below, with a stout pointed protuberance in front. The ribs are 20, 13 true and 7 false, the first nearly vertical and resembling a clavicle, and 28 in. long; from this the ribs increase to the ninth, which is 54\( \frac{1}{2} \) in. long, and thence decrease to the last, which is 21 in.; the fifth, flat anteriorly, is 4 in. wide; after the seventh they become rounded; they are not unfrequently found united, as after fracture. The scapula is more nearly equilateral and in this respect more human than in the elephant, and like some of the other bones might in rude ages be easily mistaken for the remains of giant men; its spine is nearly vertical, bifurcating below, the infra-spinous fossa more than three times as ample as the suprspinous, the former having generally a depression near the base; the glenoid cavity is 11 by 6 in. The massive humerus is 39 in. long, and the same in its greatest circumference, with a remarkable projection extending two thirds down the limb for the deltoid muscle; the circumference of the elbow joint is 44 in.; radius 29 in. long and 6\( \frac{1}{2} \) in. wide below;
the ulna much the stoutest, and 34 in. long. The fore foot measures nearly 2 ft. across; the wrist has eight bones, in two rows of four each; metacarpals five, the first or thumb the smallest (4 in. long), the second and fourth 5 in., the third (the largest) 6½, and the fifth about 4½; phalanges in thumb two, and in the others three each, supposing an ungual phalanx to be present in all, though wanting in the skeleton. The thigh bone is massive and about as long as the humerus, 17 in. in circumference at the middle and 30 at the lower portion; the knee pan nearly globular; tibia human-like, 28 in. long, 30 in. in circumference above and 13½ in. in the middle; ibula 26 in., ascending less high than the tibia, but descending lower to form the external malleolus; feet more depressed, and the toes more radiating, otherwise much as in the elephant. This skeleton is 11 ft. high, 17 ft. from end of face to beginning of tail, the latter being 6½ ft.; circumference about ribs 16 ft. 5 in.; tasks about 11 ft., of which 8½ project beyond the sockets. The teeth consist chiefly of dentine invested by enamel, though a layer of cement, thinner than in the elephant, invests the fangs and is spread over the crown. The whole number of teeth is 24, of which rarely more than 8 were in use at one time; they are developed from behind forward in order to relieve the jaws from the excessive weight of the whole at one time; the outer edge of the upper teeth projects beyond that of the lower. Two on each side in each jaw are developed soon after birth, and are shed early. In the lower jaw, the first is small, 1½ in. by ¾, and ⅛ in. high, with two transverse bifid ridges slightly notched, and two projecting much curved fangs; the second, immediately behind it, has the same characters, but is larger, 1¾ by 1½ in., and 1¼ in. high, with a prominent heel; the third is three-ridded and six-pointed, 3 by 2 in., and 1¾ high; the fourth is 3½ by 2¼, and 1½ in. high, with the inner mastoid eminence notched; the fifth is 4½ by 3 in., with the inner points notched; the sixth is four-ridded, with complex heel and deeper cleft furrows, 8 by 3 in., and 6½ high; the last sometimes has five ridges. The first and second of the upper jaw resemble those of the lower; the third is three-ridded, 2½ by 2 in.; the fourth is three-ridded, 3 by 2½ in. (and sometimes much wider), with the eminences notched; the fifth is also three-ridded, 4 by 3 in., each with two eminences; the sixth is four-ridded, with a small heel, the points sometimes bifurcated, and the furrows deep, 6½ by 3 in., sometimes larger, even to 9½ by 5¾, and with five ridges. There is no evidence of an additional premolar under the second lower milk tooth, though there may be such in the upper jaw, as in other species of mastodon, and in the tapir. At an advanced age the sixth tooth remains alone on each side above and below; in a case mentioned by Dr. Wrenn there was a seventh or upper-numeral tooth on one side of the lower jaw, 7 in. long and 7½ high. Besides the upper tusks, there are in the mastodon, though not in the elephant, inferior mandibular tusks. The food of the mastodon was entirely vegetable, as is proved by the remains of the twigs of coniferous trees, leaves, and other vegetable matter found between the ribs; and the animal doubtless resorted to marshy and boggy places, like other proboscids, in search of succulent plants, where it was often mired in the very places whence its remains have been extracted during the 19th century. Around the Shawnangunk skeleton were found tufts of dun-brown hair varying in length from 2 to 7 in.; so that the mastodon, like the Siberian mammoth, may have been clothed to withstand a climate considerably colder than that in which modern elephants live. The bones of M. giganteus have not been generally found in a mineralized state; in Dr. Warren's specimen they are light-colored, of less specific gravity than recent bones, and retain from 27 to 30 per cent. of animal matter (bone cartilage); both bones and teeth, however, have been found silicified, and they are generally impregnated with iron, which it is well known has a great preserving power.—The geological position of the remains of this species has long been and still is a subject of dispute among geologists; in a few instances they are said to have been found below the drift, in the pliocene, and even in the miocene; but they have generally been obtained from the post-pliocene or alluvial formations at a depth of from 5 to 10 ft., in lacustrine deposits, bogs, and beds of infusorial earth; Pomel and others consider them diluvial; the bones of this mastodon and of the fossil elephant have been found in company in Ohio, South Carolina, Missouri, Iowa, Illinois, Wisconsin, and various other parts of North America. Some have thought that the mastodonts became extinct since the advent of man upon the earth, like the dinornis and the dodo; according to Lyell, the period of their destruction, though geologically modern, must have been many thousand years ago. The same causes probably acted in their extinction as in the case of the fossil elephant, perhaps partly climatic changes, but more probably some great convolution on the surface of the earth at an epoch anterior to man.—About 30 species of mastodon have been described, for details on which see the work of Dr. Warren and those referred to by him. In South America lived the M. Humboldtii (De Blainv.), belonging to the narrow-toothed group, of which the European M. angustidens is the type; this is characterized by the shorter rostrated extremity of the lower jaw, the apparent absence of lower
tasks, and folds of enamel more complicated than in the teeth of _M. giganteus_. _M. Andium_ (Cuv.), a smaller species, considered by D'Orbigny the same as the last, had the same undulating folds of enamel, but a more elongated symphysis. The distinction between the _M. longirostris_ (Kaup) and the _M. angustidens_ (Cuv.) of Europe is not well made out, and authors differ exceedingly as to the limits of these species. The division of Pomel seems as probable as any; he describes as _M. longirostris_ (or _Arverreniæs_, Cr. and Job.) those having a lengthened lower jaw, four ridges in the third, fourth, and fifth teeth, five and sometimes six in the ultimate molar, tasks in the lower jaw, and a vertical upper premolar; the _M. angustidens_ he limits to the Italian species, with the same narrow teeth and four ridges in the three penultimate molars, with no beak to the lower jaw as in _M. longirostris_, or short truncated gutter as in _M. giganteus_, but with a long horizontal semi-canal slightly inclined downward. The bones, according to De Blainville, resemble more those of the Asiatic elephant than the American mastodon. Dr. Falconer, on the contrary, considers the _M. angustidens_ and _longirostris_ as perfectly distinct, and the former as more nearly related by a three-ridged penultimate molar to the _M. giganteus_ than to the _M. longirostris_, placing the first two in the section _trilophodon_ (with three ridges), and the last with the Asiatic species in the section _tetratiothodon_ (with four ridges to the third, fourth, and fifth molars). The famous Dusino mastodon (_M. Turinensis_), discovered near Turin in 1849 in a fluvio-lacustrine deposit, described by Prof. Siamonda, whose description is partially reproduced with a figure in Dr. Warren's work, belonged to the _M. angustidens_; in the same deposit were found remains of elephants and other large pachyderms. Pomel's other species, less clearly made out, are _M. Cuvieri_, with a prolonged lower jaw and the three penultimate molars with three ridges; _M. tapiroides_, with tuberculated teeth, forming a connecting link with those of the dinotherium (both of the last are found in central and southern France, the _M. longirostris_ having been found in central Germany, at Eppelsheim); and the _M. Buffonis_, with short thick teeth, to which he refers the Siberian specimens. The age of the European mastodons was earlier than that of the American, their remains having been found as low as the miocene, and probably long anterior to the elephant, which was a contemporary of the American mastodon; according to Pomel, _M. angustidens_ is found with _M. Buffonis_ in pliocene, and _M. Cuvieri_ and _tapiroides_ in miocene lacustrine deposits; but at Turin bones of the elephant, rhinoceros, hippopotamus, and tapir were found with the Dusino specimen, so that the fossil elephant of the old world would seem to have been anterior to that of the new. Pictet describes also _M. brevirostris_ (Gervais), from the pliocene of the south of France, with the lower jaw short as in elephants, the lower tusks not at all or slightly developed, and the molars as in _M. longirostris_, with secondary tubercules between the ridges; he mentions other species as found in the pliocene of Puy and Auvergne. Two species found in Asia may be mentioned here in conclusion—the _M. Sivalensis_ (Falc. and Cautl.), from the Sivalik hills, and the _M. latidens_ (Clift), from the banks of the Irrawaddy; in the former the teeth are very large, the ultimate molars being from 8 to 9½ by 3 to 3½ in., with six ridges in the upper jaw, rounded mammilla, and rather narrow form; in the latter the form is broader, and the teeth sometimes with as many as ten ridges, and seemingly one of the links connecting mastodon with elephant; these belong to the section _tetratiothodon_. The specific name of _tetratiothodon_ given by Dr. Godman to some mastodon specimens, from their having two tasks in the lower jaw, is now generally admitted to be ill-founded; lower tusks are found in young males of many species, and sometimes one or both in the adult male, their presence being probably a sexual and not a specific character. Dr. Leidy and others have indicated several species of mastodon in Kansas and Nebraska, and other newly explored regions of North America; these are described in the "Proceedings" of the Philadelphia academy of natural sciences. Several specimens have been found near Cohoes and Ithaca, N.Y., and recent explorations have indicated their presence in all the middle, northern, and western states.—According to Owen, the mastodons were elephants with molars less complex in structure and adapted for coarser vegetable food, ranging in time from the miocene to the upper pliocene, and in space throughout the tropical and temperate latitudes. The transition from the mastodon to the elephant type of dentition is very gradual.

**Mastodon Saurus.** See _Labirinthodon_.

**Masudi.** Abul-Hasan Ali ben Hussein ben Ali, an Arabian scholar, born in Bagdad about 890, died probably in Cairo in 956. He belonged to a family illustrious from the time of Mohammed. From childhood he exhibited remarkable talents and fondness for study, and attained a universality of erudition which has been equalled by no other Arab. On some important questions he expressed ingenious and novel views, which were in advance of his successors for several centuries. Not content with the information contained in books, he undertook several long journeys. About 914 he visited the ancient Persepolis, and passed thence to India, Ceylon, the coast of China, Madagascar, and southern Arabia, and explored the region of the Caspian sea. About 926 he was in Palestine, and he subsequently dwelt in Syria and in Egypt. He says he travelled so far to the east that he forgot the west, and so far to the west that he forgot the east. His most important work is the _Askbar al-zeman_, or "History of the Times,"
an immense general history, which has never been printed; no copy of it exists in Europe. His second work, entitled Kitab al-wasat, or "Book of the Middle," treated curious questions in history, geography, philosophy, and the sciences; but copies of it are very rare, and unknown in Europe. Perceiving that these works were too voluminous to be popular, he wrote a smaller history, entitled Moruj al-dhekeb ve-maadin al-jevadhir, or "Meadows of Gold and Mines of Gems," which is not rare in the libraries of Europe. The first volume has been translated into English by Dr. Aloys Sprenger (London, 1841); there is a French translation by Derenbourg, and an edition of the original with a translation by Barbier de Meynard (7 vols., Paris, 1861-73). He is the author of a variety of other works on religion, morals, medicine, and the sciences, some of which are extant in manuscript, and others are known only by their titles.

MASULIPATAM, a town of British India, capital of a district of the same name, on the bay of Bengal, 220 m. N. by E. of Madras; pop. about 30,000. The native town is connected by a causeway with the fort, which contains military establishments, a Protestant and a Roman Catholic church, and several residences. Cotton goods and other articles manufactured here were formerly largely exported to the Persian gulf, but this business has greatly fallen off. The central part of the town belongs to the French government, and, not being amenable to British authority, is a resort of smugglers.

MAT, a coarse fabric made by interweaving strips of the inner bark of trees, flags, rushes, husks, straw, grass, rattans, or similar materials, and used for covering floors, for beds, sails, packing of furniture and goods, and a variety of other purposes. In Paris mats were commonly employed as tapestry for lining the walls of rooms till some time in the last century. They serve among rude nations as a substitute for wooden doors and glass windows. By gardeners they are employed to protect delicate plants from frost. Mats are supposed to be the first fabrics that were woven by man; and almost all savage tribes now possess considerable skill in their manufacture. The grass mats of the South sea islanders are often of great beauty for their fineness and the brilliant colors of their dyes. The Japanese cultivate a peculiar species of rush for making mats, and the softness and elasticity of these well adapt them for beds or floor coverings. The Chinese make rattan floor mats of all sizes, but chiefly about 7 ft. by 5; also rush floor mats, and table mats of rattans and rushes, all of which are exported. In Europe, mats from reeds and rushes are largely produced in Spain and Portugal; but in Russia the manufacture is a prominent branch of national industry. The material there employed is the bark of the lime or linden tree, and the mats are known in Europe as "bast" mats. In the governments of Viatka, Kostroma, and those adjoining, the villages are said to be almost deserted during May and June, the whole population being in the woods stripping the trees. (See LINDEN.)

MATAGORDA, a S. E. county of Texas, bordering on the gulf of Mexico and Matagorda bay, intersected by the Colorado river and Caney creek; area, 1,334 sq. m.; pop. in 1870, 3,377, of whom 2,120 were colored. The soil of the Colorado and Caney bottoms is deep and rich, equally adapted for the cultivation of sugar and cotton. West of the Colorado are large prairies with light sandy soil clothed with luxuriant pasture. Timber (mostly oak, cedar, pecan, and hackberry) is confined to the banks of the streams. The chief productions in 1870 were 94,195 bushels of Indian corn, 13,777 of sweet potatoes, 12,285 lbs. of wool, 22,325 of butter, 1,590 bales of cotton, and 55 hogheads of sugar. There were 2,841 horses, 808 mules and asses, 1,395 milk cows, 98,877 other cattle, 8,488 sheep, and 2,811 swine. Capital, Matagorda.

MATAMOROS, a frontier city of Mexico, in the state of Tamaulipas, on the right bank and 40 m. from the mouth of the Rio Grande, oppo-

The Cathedral, Matamoros.

site Brownsville, Texas, and 450 m. N. of Mexico; pop. about 12,000. It is situated in a plain on a bend of the river. The streets are wide and cross each other at right angles,
and the houses are mostly of brick and built after the American style. Churches and convents are numerous; and there are several public and private schools. In fair weather good-sized vessels are towed up to the town; while at other times the entrance to the river, obstructed by sand bars, is difficult and often impossible even for schooners. The climate is extremely hot from April to September, with violent south winds, while from December to March, in the season of the northerns, it is very cold, often with much snow. Although considered to be one of the most unhealthy places in Tamaulipas, Matamoros is the only gulf port exempt from yellow fever. Specie, hides, wool, and horses are the principal exports; cotton, linen, woollen, and silk fabrics, and machinery are imported, mainly from the United States and Great Britain.—Matamoros was founded toward the commencement of the present century. The Americans under Gen. Taylor occupied the town in May, 1846, after the victories at Palo Alto and Resaca de la Palma. The people are mainly of Spanish descent; but there are many American residents, and English is almost as commonly spoken as Spanish.

**MATAMOROS, Mariano, a Mexican patriot, executed at Valladolid, Feb. 13, 1814.** The time and place of his birth and the circumstances of his early life are unknown. In December, 1811, he was parish priest of Jantelolco, a small village south of Mexico, when, being molested by royalist troops and threatened with imprisonment, he fled to Izcual and joined the insurgents. He was favorably received by Morelos, and at once made a colonel. In that capacity he speedily acquired influence and popularity among the troops, and displayed great military talent. In the defence of Cuauhtémoc against Gen. Calleja, the glory attributed to Morelos was largely due to Matamoros. In the expedition to Oajaca he took a conspicuous part, and in October, 1813, won the victory of San Agustin del Palmar. The Mexican revolution was now triumphant from Guatemala to Jalisco, except in a few of the larger cities, when Morelos injudiciously resolved to attack the capital of Michoacan. Repulsed from Valladolid, Matamoros collected his forces at Pueblan, where Morelos again rashly precipitated an action fatal to the cause of independence. Matamoros was captured and executed. Alaman in his history describes Matamoros as the most active and successful leader of the insurrection, and ascribes its temporary failure to his death. His memory is highly honored by the Mexicans; his bones were placed with those of Hidalgo and Morelos in the cathedral of Mexico, and his name has been given to two important towns, as well as to districts in several states.

**MATANZAS,** a fortified seaport of Cuba, on the San Juan river, here crossed by a bridge, and at the head of a beautiful bay of the same name, 53 m. E. of Havana; pop. about 30,000, a considerable decrease since 1868, attributable to the large numbers who emigrated after the outbreak of the revolution in the island. The town stands on a gentle slope toward the river; the streets are wide, regular, well kept, and lighted with gas; and the houses, chiefly of stone, are solidly built, and in the same style as those of Havana. The handsomest of the public squares is the plaza de Armas, where military bands attend every evening, and the walks are crowded with fashionable promenaders. There are two churches, a castle, fine barracks, a hospital, a good theatre, and a cockpit; and among the schools, which are proportionately more numerous here than in any other Cuban town, is the Empresa academy, one of the best educational institutions in the West Indies. The harbor is spacious, easy of access, and well sheltered, save to the northeast; and the surrounding country, comprising the richest portion of the island, is covered with magnificent sugar estates. The climate, though hot, is more salubrious than that of Havana. The principal exports are sugar, molasses, and a
The quantities of the first exported in 1871, '72, and '73 were as follows:

The imports include manufactured goods, breadstuffs, and provisions, mainly from the United States, and machinery, partly from Great Britain and partly from the United States. About 500 American vessels of all sizes visit the port annually; and the coasting trade, especially with Havana, is very extensive. Matanzas is connected by two lines of railway with Havana.

**MATAPLAN, Cape.** See Cape Mataplan.

**Mataró,** a maritime city of Catalonia, Spain, in the province and 16 m. N. E. of the city of Barcelona; pop. about 17,500. It is divided into the old and new towns; the former on a declivity, with narrow and crooked streets, and the latter with regular and spacious streets, and well built. There are eight squares. Besides the parish church, embellished with fine paintings by Viladomat and Montaña, there are several chapels, two convents, a city hall, court house, prison, and barracks. The hospital and the custom house are fine structures. There is a college founded in 1737, schools in a prosperous manufacturing town, producing cotton, linen, woolen, and some silk fabrics, sails, ropes, glass, hardware, soap, leather, wine, and brandy. Timber and fruit are also exported. Fishing is extensively carried on. Mataró is connected with Barcelona by a railway opened in October, 1848, the first built in Spain.

**MATCH,** a small stick of combustible material furnished with some very inflammable composition, and used for producing fire. It is commonly known in England as the "lucifer match" or "lucifer." In 1850, a few years after the discovery of phosphorus, a substance was introduced for this purpose in London by Godfrey Hanckwitz, who applied it by rubbing it between folds of brown paper till it took fire; it was then made to ignite a stick, one end of which had been dipped in sulphur, and which may be considered the earliest form of the common match. Another form extensively used was called chemical matches, which were sold in little cases called phosphorus boxes, containing a few matches, at first as high as 15s. a box. They were small sticks of wood dipped first in sulphur, and then in a composition of chlorate of potash, flowers of sulphur, colophony, gum or sugar, and cinnamon for coloring. Accompanying them in the box was a vial containing sulphuric acid, into which the match being dipped, it was instantly ignited by the chemical action between the acid and chlorate of potash. The other ingredients were added merely on account of their combustible qualities. The primitive flint, steel, and tinder, however, remained in common use till the invention of the lucifer match in 1829, by Mr. John Walker, chemist, at Stockton-upon-Tees. In his experiments upon chlorate of potash, he found that this could be instantly ignited by friction, as in rapidly drawing a stick coated with it and phosphorus by means of mucilage or glue through folded sand-paper. Mr. Walker manufactured but few of these matches for use in his neighborhood. Faraday, learning of them, procured some, and brought them into public notice. Their useful properties were soon perceived, and their manufacture rapidly increased, till it became an important branch of industry in Europe and the United States.—The best wood for matches is clear white pine, which possesses the softness required for the manufacturing process, together with the necessary stiffness and inflammability; and the quantity of this consumed in their manufacture is enormous. The wood is first sawed into blocks of uniform size, and the length of two matches. By machines of ingenious construction, these are afterward slit without loss of material into splints. They are then dipped in melted sulphur, and afterward in phosphorus composition. Round matches are formed by forcing the wood endwise through holes in plates, which in the English works are an inch thick, with steel face and metal back. In America the establishments tubes are employed whether for round or square splints. The perforations are made as near together as possible, only leaving enough of the metal between to give the necessary strength for cutting. This invention was patented in England by Reuben Partridge in 1842.—Matches are now often made without sulphur, paraffine oil being employed for saturating the wood. According to Böttger, the best composition for matches consists of phosphorus 4 parts, nitre 10, fine glue 6, red ocher 8, and small 2 parts. Safety lucifer matches are made, in which a paper tube, the combustibles, the phosphorus, and nitrate of potash, is placed on one surface, as a piece of sand-paper, while the other part, containing chlorate or nitrate of potash, is placed on the tip of the match. Neither match nor sand-paper singly will take fire from friction except when rubbed against each other. To prevent matches from smouldering, the wood is sometimes soaked in a solution of alum, borax, Glaner salts, or Epsom salts.—Nearly all the operations of match making, formerly conducted by hand, are now accomplished by machinery. In large establishments four machines are used for cutting, dipping, and delivering the matches. Two-inch pine plank is sawed up the length of the match, which is 2½ in. These go into the machine for cutting, where at every stroke 12 matches are cut, and by the succeeding stroke pushed into slats arranged on a double chain, 250 ft. long, which carries them to the sulphur vat, and thence to the phosphorus vat, and thus across the room and back, returning them at a point in front of the cutting machine, where
they are delivered in their natural order. They are gathered up by a boy into trays, and sent to the packing room. In this manner 1,000 gross or 144,000 small boxes of matches are made in a day. No correct statistics of match making can be given, but it has been estimated that six matches a day for each individual of the population of Europe and North America is the average consumption. From these figures it is easy to see that the business is enormous.

—The acid fumes thrown off from phosphorus in the various processes of making matches frequently cause among the people employed a terrible disease which attacks the teeth and jaws; and to such an alarming extent did it prevail in Germany, that the attention of the government was called to it. The dippers are most liable to suffer in this way, in consequence of standing for hours over the heated slab upon which the phosphorus is spread. As persons with decayed teeth are most susceptible to the disease, they are carefully excluded from some manufactories. No antidote has yet been discovered to this disease. Its natural course is to rot the entire jaw bone away. (See **Phosphorus**.)—Insignificant as matches are, it is important, on account of the immense numbers made, that the manufactories should be in districts where timber is cheap. Some of the splints are exported to the West Indies and South America. The match- es themselves are largely exported to the East and West Indies, Australia, China, Mexico, South America, &c.

**MATÉ**, or **Paraguay Tea**, the leaves of a native holly found in South America, an infusion of which is drunk by the people as tea is by Chinese and Europeans. The leaf and the drink are called *maté*, the aboriginal name for the cup used in preparing the infusion. The plant, called *yerba maté*, is the *Ilex Paraguayensis*, a holly which grows upon the banks of rivers in Paraguay and in the mountains of Brazil; it is a tree 15 or 20 ft. high, and when allowed to develop itself forms a handsome head, but where its branches are collected it is only a moderate-sized shrub with numerous stems from one root. The ovate lanceolate leaves are persistent, 4 to 5 in. long, with their margins unequally serrate; the numerous white flowers are in umbellate clusters, and succeeded by a four-seeded berry about the size of a pepper grain. The leaves are collected by parties of 20 to 50 persons, who go to the forests prepared for an encampment of several months. The first step is to prepare a hard earthen floor, by beating the ground with mallets; over this an arch of poles is built, upon which are laid the leafy branches of the maté, where they are kept over a lively fire made beneath until thoroughly scorched; after this roasting, the leaves are beaten from the branches by means of sticks, in which operation they are reduced to a coarse powder. The broken leaves are packed in leathern sacks made of a bullock’s hide, which contain from 200 to 220 lbs. A day’s work for a peon is the collection of a sufficient amount to make 200 lbs. of the prepared maté. Several varieties are known, depending upon the development of the leaf and the care taken in the preparation of it. The method of using it is to place a handful of the leaves in the *maté* or cup, and pour boiling water over them; as soon as the infusion is sufficiently cool to be tolerated, it is sucked through a tube called a *boquilla*, which is perforated with holes at the lower end to prevent the entrance of fragments of the leaves; the cup is passed from one to another, each person among the South Americans using the same tube in turn; but Europeans living in the country carry a small glass tube which can be slipped into the opening of the cup. The latter is frequently a calabash fixed upon a stand, and among the wealthy mounted with silver or sometimes entirely of silver and elaborately ornamented. The Europeans found the maté in use by the aborigines and readily adopted the custom, and it is estimated that no portion of the world consumes so large an amount of Chinese tea in proportion to the population as is used of the maté by the South Americans. The infusion of maté is usually drunk without addition, though some use sugar and others lemon with it; it is described as having great fascination to those accustomed to it, and those who commence drinking it find it almost impossible to abandon its use. It is taken at every meal and at all hours of the day, and marvellous stories are told of its virtues; like tea and coffee, it no doubt enables the system to resist fatigue, and its use among miners and others who undertake hard labor is universal in most South American countries. It seems to act as an excitant to the stomach, and in large doses is emetic and purgative. Its more important properties, however, are probably closely allied to those of ordinary tea or cof-
fee, as it contains nearly one half of one per cent. (0.4%) of caffeine and 20-88 of caffeo-
tannic acid. The amount of the leaves exported
annually from Paraguay is estimated at over
5,000,000 lbs. The early Jesuit missionaries,
knowing the fondness of the aborigines for the
maté, established plantations of the tree, on
which account it is sometimes called Jesuits’
tea. The leaves of a related species, "ilex cas-
sina," furnished the "black drink" or "yaupon
of the Creek Indians; the leaves of this possess
emetie qualities, and the power of resisting
them was regarded as a mark of superiority.

**MATERA**, a town of S. Italy, in the prov-
ince and 43 m. E. of the city of Potenza,
on the Gravina; pop. about 14,000. It is the seat
of an archbishop, and has a royal school of
belles-lettres, medicine, law, and agriculture,
and manufactories of firearms. Near it are
the famous caverns of Monte Scaglione.

**MATERIA MEDICA.** See Medicine.

**MATHEMATICS** (Gr. μάθημα, or μάθησις, learn-
ing), as usually defined, the science of quanti-
ties; or more precisely, the science which de-
termines unknown quantities by means of their
relations to known quantities. But the ten-
dency of modern thought is to give the term
a much wider meaning, to include under it all
exact sciences, and to designate as mathematical
every science which can be reduced to a limit-
ated number of definite conceptions from which
all the propositions which constitute the science
can be deduced in accordance with the rules of
logic. It is defined by Kant as the science of
the laws of space and time, since it treats of
the quantities occupying space and time, and
representable by diagrams, numbers, or symb-
ils. In this he has been followed by De
Morgan and some other mathematicians. In
order to make the science conform to the
definition, they have been obliged to regard
the idea of number as included or implied in
the idea of time. The present tendency of
mathematical speculation is to regard mathe-
matics, when considered in its most general
form, as a branch of the science of mind, and
every mathematical formula as expressing an
operation of the understanding. This doctrine
is expressly asserted by Ohm, and seems to be
implied, if not expressly stated, in the writings
of Grassmann, Peirce, and many other modern
mathematicians.—The science is distinguished
as pure or mixed mathematics, according as it
treats of laws and relations in abstracto, with
reference to nothing actual, or in concreto,
with reference to existing phenomena. The
former, dealing with abstract quantity, does
not imply the idea of matter; the latter, deal-
ing with concrete quantity, embraces the actual
material world. The former gives the absolute
form of the universe; the latter, their illustra-
tions by real examples. The elements em-
ployed by the former are self-evident princi-
pies, suggested or immediately grasped by the
reason itself; the latter applies these principles
to natural objects, the properties of which
must be learned by induction from experience.
The former treats of possible, the latter of ac-
tual magnitudes.—The branches of pure mathe-
matics are arithmetic, geometry, algebra, ana-
lytical geometry, and the differential and in-
tegral calculus. Arithmetic is the science and
art of numbers. It does not calculate functions
or relations, but special values in every case.
Its single elementary idea is one or unity, from
which all other numerical values, integral or
fractional, are formed. The processes of arith-
metic lie at the basis of all others. Geome-
try measures extension, comparing portions of
space with each other. Its elements are not
numbers, but lines, surfaces, and volumes or
solids. Lines have only the dimension of length,
and are either straight or curved. Surfaces
embrace both length and breadth, are either
plane or curved, and are distinguished as tri-
angles, quadrilaterals, polygons, &c., according
to the number of lines within which they are
contained. Solids combine the three dimen-
sions of length, breadth, and thickness, and
are distinguished as the cube, pyramid, cone,
sphere, &c., according as they are bounded by
planes, by plane and curved surfaces, or only
by curved surfaces. Definitions, or statements
of a *priori* facts, axioms, or statements of self-
evident relations, and propositions, deduced
from definitions and axioms, as premises, in a
series of logical arguments, are the three class-
es of geometrical truths. Algebra, analytical
geometry, and the differential and integral
calculus embrace the entire portion of mathe-
matical science in which quantities are repre-
ented, not by numbers or diagrams, but by
letters of the alphabet. In arithmetic, all prop-
ositions concerning numbers, embracing units
of the same kind, are true without regard to the
nature of the quantities to which they may be
applied. In geometry, every figure represents all the properties inherent in all the
figures of its class. But the truths both of arith-
metic and geometry are applicable only to spe-
cial and actual classes of things. Algebra has a
broader generalization. Its symbols extend to
all objects whatsoever, and do not suggest
ideas of particular things. They stand as rep-
resentatives of things in general, whether ab-
stract or concrete, real or hypothetical, known
or unknown, finite or infinite. Having the
relation of quantities embodied in an equation
of symbols, we may proceed to trace what
other truths are involved in the one thus stated,
resolving the symbolic assertion step by step
into others more fitted for our purpose, thus
following long trains of symbolic reasoning,
every result of which must express some general
truth, though, in the present state of our knowl-
edge, we may not be able to give any actual
example of the truth. Analytical geometry,
the application of algebra to geometry, is that
branch of mathematical science which exam-
ines, discusses, and develops the properties of
general magnitudes, by noticing the changes
which take place in their representative alge-

braic symbols. The geometrical question is solved by resolving the corresponding algebraic equation. Algebra being defined as the ordinary analysis, calculus is the transcendental analysis, and has various applications in the higher departments of the science. The best achievements of modern mathematics are due to it.—To these branches of mathematics the 19th century has added another, the final form of which is as yet undetermined, but the essential characteristics of which are to be found in the "quaternions" of Sir W. R. Hamilton, in the Ausdehnunglehre of H. Grassmann, and in the "Linear-Associative Algebra" of Prof. Peirce. The great characteristics of this new science are: 1, the introduction of several units differing in quality; and 2, the rigid distinction between the multiplier and the multiplicand, or between the thing which acts and the thing acted upon. In the mathematical sciences, as hitherto treated, $xy$ is always equal to $yx$; it is a matter of indifference which quantity we regard as multiplier and which as multiplicand. In the new science the distinction must be always regarded; $xy$ and $yx$ are entirely different things. The second characteristic is really a result of the first. Thus, in geometry, as treated by Grassmann, we have four different units, viz., a point and three mutually perpendicular straight lines. From the combinations of these units all the truths of geometry are deduced. Prof. Peirce, in his work above mentioned, has endeavored to fix a priori the laws which must regulate this introduction of units, and has divided algebra, according to the number of units introduced, into single, double, triple, &c. We can enter into no further explanations of this branch of mathematics, but will remark that as the great event in the intellectual history of the 17th century was the invention of the calculus, so perhaps future historians will regard this as the great event in the history of the 19th century.—Algebra and geometry are usually, but not with strict accuracy, regarded as types respectively of analytical and synthetical reasoning. The former has an artificial language. Symbols are operated upon according to certain general rules, while the mind dismisses altogether the conceptions of the things which the symbols represent, whether lines, angles, velocities, forces, or whatever else. The steps in the processes are merely applications of the rule. The elements are symbols, and the results are only equations. Geometrical reasoning, on the contrary, is concerning things as they are. It retains the conceptions of quantities. It apprehends the nature of the new truths which it introduces at every step. Analysis is therefore the more powerful instrument for the professed mathematician, but geometry is the more effective mode of exercising the reason, and is a more useful part of the gymnastics of education.—Comte, who makes mathematics preeminent in the hierarchy of the positive sciences, introduces a peculiar classification. Abstract mathematics, according to him, embraces ordinary analysis, or the calculus of direct functions, and transcendental analysis, or the calculus of indirect functions. The former includes arithmetic and algebra; the latter, the differential and integral calculus and the calculus of variations. Concrete mathematics embraces synthetic and analytic geometry, the former being either graphic or algebraic, and the latter being distinguished according as its objects are of two or three dimensions. Comte includes also rational mechanics, or the laws of statics and dynamics, as a department of concrete mathematics. If the universe were immovable, there would be only geometrical phenomena; but motions are mechanical phenomena. As commonly explained, the mixed mathematics are the applications of abstract mathematical laws to the objects of nature and art. From the universality and variety of these objects, no strict and comprehensive classification of them has been made. Matter in rest and matter in motion are the primary phenomena in space and time. The laws which rule the one and the forces which impel the other are the first objects of inquiry. Mechanics treats of both, and is divided into statics and dynamics, dealing respectively with the equilibrium and the action of forces. Astronomy, hydraulics, pneumatics, optics, and acoustics may be regarded as subdivisions of dynamics. Surveying, architecture, fortification, and navigation are among the principal applications of mathematics to the arts.—The pure mathematics are merely formal sciences. They occupy and discipline but do not fill the mind. Their entirely formal character will be best appreciated by one or two illustrations. It is a law of falling bodies that the spaces passed through by the falling body are proportional to the squares of the times during which it falls. It is a law of geometry that the areas of circles are proportional to the squares of their radii. The mathematical formula expressing one of these laws also expresses the other. Let $A: a = B^2 : B^3$, and we may consider $A$ and $a$ as representing either spaces described by a falling body or areas of circles, and $B$ and $b$ as representing either the times during which it falls or radii of circles. In either case the formula is true. Yet the space described by a falling body and the area of a circle, the time during which a body falls and the radius of a circle, are wholly disparate notions. When we see a person adding a column of numbers, no inspection of the column itself will tell us what the person who wrote it down intended to represent by those numbers. He may have had in his mind sums of money, or yards of cloth, or bushels of wheat. Whatever it was, the process of finding the sum is in all cases the same. Again, an engineer investigating a problem in regard to bridge building, an actuary one in life insurance, a machinist one in mechanics, might all arrive at the same algebraical for-
formula. The formula expresses merely a relation between the different objects, and the relation in all these cases may be the same, although the objects themselves have nothing in common. The engineer, the actuary, and the machinist would each interpret the formula in accordance with the nature of the objects about which he was specially concerned. —The attempt has often been made to give to philosophical speculations a mathematical form, in order to give them mathematical certainty. Thus Pythagoras sought in the ideas of order and harmony mysteriously attached to numbers the reasons for great cosmical phenomena. Plato, who forbade any one unacquainted with geometry to enter his school, combined mathematical with philosophical doctrines especially in his "Timeus," the most obscure of his dialogues. The Neo-Platonists revived the Pythagorean mystical views of numbers. In modern times Spinoza, Wolf, and Herbart have been chiefly distinguished for introducing the mathematical method into ethical and metaphysical systems. The latter wrote a work on psychology abounding in algebraic formulas. These attempts have led to no important results. The definitions, axioms, and processes of mathematics deal with objects of sense, which are known with perfect exactitude, which are apprehended as precisely the same by all, concerning which phenomena there can be no such thing as opinion, but only absolute certainty, and the reality of the relations between which can be doubted only by disputing the validity of all human ideas. In none of the most scientific metaphysical and moral systems have the definitive and axiomatic elements been thus precisely and authoritatively determined.—The history of mathematics may be divided into three great periods, each characterized by the introduction of important new methods. In the first, the era of Greek and Roman supremacy, geometry was almost exclusively cultivated. While arithmetic was hardly more than a mechanical calculation by means of the abacus, geometrical methods attained a degree of elegance scarcely to be surpassed, as appears from the rank still maintained by Euclid. After the decline of Rome, the sciences took refuge among the Arabs, who translated and preserved the literary treasures of Greece. The Arabian philosophers were, however, rather learned than inventive, and added little to the heritage. But they introduced the second great period in the progress of mathematics by imparting to Europe the decimal arithmetic and the algebraic calculus, both of which were perhaps of Indian origin. The latter, diffused in Italy by Leonardo, a merchant and traveller of Pisa, early in the 18th century, soon received important improvements. Scipio Ferrea (1505) was the first to solve a cubic equation. Cardan and Tartaglia disputed the honor with him and with each other, while Ferrari solved the bi quadratic equation, and Vieta (1600), Girard, and Harriot entered upon the general theory of equations. The algebraic analysis was thus brought nearly to its present state of perfection. It was at first regarded merely as a preparatory process in the investigation of a problem, to be afterward exchanged for a geometrical construction and synthetic proof. But it gradually supplanted diagrams as a medium of demonstration, being found to surpass them in force and compass. With Descartes begins a great revolution of mathematical science. His mode of characterizing curves by an equation between two variable magnitudes revolutionized the mode of conceiving geometrical questions. Symbolical language, found adequate for every purpose, soon became the general medium of mathematical inquiry, and has been the principal weapon by which its subsequent splendid triumphs have been achieved. Perceiving the importance of the discovery, Descartes hastened to apply it to questions of the greatest difficulty and generality, and resolved the problems of tangents and of maxima and minima. The methods of Roberval and Fermat tended toward the discovery of the differential calculus, which was made independently by Newton (under the form of fluxions) and by Leibnitz. Already Napier had invented logarithms, and Newton the binomial theorem; Mercator had accomplished the quadrature of the hyperbola, and Wallis the quadrature of many other curves while seeking that of the circle. The integral calculus (the Newtonian method of quadratures), the inverse of the differential, was improved by Leibnitz and the Bernoullis; Euler extended the theory of analytical trigonometry; Fontaine illustrated that of differential equations; Taylor invented the calculus of finite differences or increments; Cavalieri published his method of indivisibles; and other improvements were introduced by Kepler, Huygens, and Wallis. The Principia of Newton (1687) has gained for him the title of "the profoundest of geometers as well as the first of natural philosophers." Euler combined with that of Leibnitz in preparing for the achievements of the mixed mathematics. Euler, D'Alembert, and Daniel Bernoulli were the most distinguished of their successors till near the close of the 18th century. Euler suggested conceptions in the application of analysis which others elaborated in almost every part of mathematical science; D'Alembert established a principle by which every dynamical question was resolved into a statistical one; Daniel Bernoulli received ten prizes from the French academy of sciences; and other contemporaries, as Clairaut and Maclaurin, were extending the application of mathematics to mechanics and physics. In the period embracing the latter part of the 18th and the early part of the 19th century, the names of Lagrange and Laplace had no rivals. By them the application of all modes of calculation to the mechanics of the universe was carried to the highest pitch of generality and
symmetry. One of the most remarkable achievements of the science was Leverrier's prediction in 1846 of the place and orbit of the planet Neptune from the motions of Uranus, announced before its discovery by the telescope the existence, position, and magnitude of a body beyond the recognized limits of our system, merely as an inference from the perturbations of the outermost planet known to us. Poisson, Airy, Plana, Hansen, Gauss, Adams, De Morgan, and Peirce are among the recent mathematicians who have solved important problems in the physical application of analysis. Many new mathematical theories have been originated during the last half century. Among them may be mentioned the theory of determinants, the theory of invariants of Mersenne. Cayley and Sylvester, that of clairns of Mr. Ellis, and many others. Some of them will probably pass into history only as evidences of the ingenuity of their authors, while others promise to be of great value. As they are of interest to professed mathematicians only, they require no further notice in this work.—Among the greatest works in mathematical literature are the Principia of Newton, the Mechanic of Euler, the Théorie des fonctions and the Mechanique analytique of Lagrange, the Application de l'analyse à la géométrie de Monge, and the Mécanique céleste of Laplace.—See Montucla, Histoire des mathématiques, continued by Lalande (4 vols, Paris, 1799-1802); Bossut, Essai sur l'histoire des mathématiques (2 vols., Paris, 1802); Comte, Philosophie positive, vol. 1, and Synthèse positive; Libri-Carucci, Histoire des sciences mathématiques en Italie (4 vols., Paris, 1838-41); Montferrier, Dictionnaire des sciences mathématiques (2d ed., 3 vols. 4to, Paris, 1844), and Encyclopédie mathématique d'après les principes de la philosophie des mathématiques de Hôno Wronski (4 vols. 8vo, Paris, 1856-9); Fries, Die mathematische Naturphilosophie (Heidelberg, 1892); Poppe, Geschichte der Mathematik (Tübingen, 1828); Ohm, Versuch eines vollkommenen, consequenten Systems der Mathematik (3d ed., Nuremberg, 1853-5); Bartholomé, Philosophie der Mathematik (Jena, 1860); Davies, "Logic and Utility of Mathematics" (New York, 1851); and Davies and Peck, "Mathematical Dictionary" (New York, 1856). See also the works cited under the title Geometry.

MATHER. I. Richard, an English clergyman, born at Lowton, Lancashire, in 1656, died in Dorchester, Mass., April 22, 1669. He received a good education, became a schoolmaster at Tuxted Park, near Liverpool, at the age of 15, was admitted to Brazenose college, Oxford, in 1618, was ordained a few months later, and became the minister of Tuxted, where he remained 15 years. He was suspended for two years. Two of the established church in 1683, and, though soon restored by the influence of friends, was again silenced in 1684. He therefore emigrated to New England, landing in Boston Aug. 17, 1635. In the following year he became pastor of the church in Dorchester, where he resided till his death. He was the author of several brief theological treatises and letters, chiefly on church government, and drew up in 1648, at the instance of the Cambridge synod, a model of discipline, which was accepted. He married in 1656 the widow of John Cotton. Of his six sons by his first wife, four were distinguished clergymen and authors: Samuel (1626-71), in Dublin, Ireland; Nathaniel (1630-97), in London; Eleazar (1637-99), in Northampton, Mass.; and Increase. His "Journal, Life, and Death" has been published for the Dorchester antiquarian and historical society (Boston, 1850).

II. Increase, an American clergyman, son of the preceding, born in Dorchester, Mass., June 21, 1639, died Aug. 28, 1723. He graduated at Harvard college in 1656, and in 1658 at Trinity college, Dublin. He afterward preached in Devonshire and the island of Guernsey. He returned to America in 1661, and was pastor of the North church, Boston, from 1664 till his death. He was a member of the synod of 1679, and drew up the propositions which were adopted concerning the proper subjects of baptism. In 1681 he was elected president of Harvard college. The reluctance of his church to relinquish him induced him to decline the office; but in 1685 he accepted it with a stipulation that he should retain his relation to his people. He continued in this station till 1701, when he retired in consequence of an act of the general court requiring the president to reside in Cambridge. He procured an act authorizing the college to create bachelors and doctors of divinity, and received in 1692 the first diploma for the degree of D. D. that was granted in America. When in 1683 Charles II. demanded that the charter of Massachusetts should be resigned into his hands, Mather was foremost in opposing the measure; and when that monarch annulled the charter in 1684, he was sent to England as agent for the colonies. He was in England during the revolution of 1688, and, finding it impossible to obtain a restoration of the old charter, accepted a new one, under which the appointment to all the offices reserved to the crown was confined to him. He returned in 1692, when the general court appointed a day of thanksgiving for his safety and for the settlement of the dispute. He is said to have condemned the violent proceedings which followed relating to witchcraft. He was accustomed to spend 16 hours every day in his study, and always committed his sermons to memory. One tenth part of all his income was devoted to charity. He was the author of 92 distinct publications, now mostly very scarce. Two of these were written in Latin. His "Remarkable Providences" was republished in the "Library of Old Authors" (London, 1856), with an introduction.
by George Offor. He married a daughter of John Cotton. III. Cotton, an American clergyman, son of the preceding, born in Boston, Feb. 12, 1663, died Feb. 13, 1728. He studied at the free school in Boston, and graduated at Harvard college in 1678. In his 14th year he began a system of rigid and regular fasting and vigils, which he continued through life, and at the age of 16 made the Christian profession. After leaving college he taught, and having overcome an impediment in his speech, he then devoted himself particularly to theological studies. In 1680 he became the assistant of his father in the pastorate of the North church, Boston, and in 1684 was ordained as his colleague. It was his aim to maintain the ascendancy which had belonged to the clergy in New England in civil affairs, but which was then on the decline; and in 1689 he prepared the public declaration justifying the imprisonment of Gov. Andros. In 1685 he published his "Memorable Providences relating to Witchcraft and Possessions," narrating cases which had occurred at intervals in different parts of the country, which was used as an authority in the prosecution of the "Salem tragedy." When the children of John Goodwin became curiously affected in 1689, he was one of the four ministers of Boston who held a day of fasting and prayer, and favored the suspicion of diabolical visitation. He afterward took the eldest daughter to his house in order to inspect the spiritual and physiological phenomena of witchcraft, and his experiments are wonderful instances of curiosity and credulity. He discovered that the devils were familiar with the Latin, Greek, and Hebrew, but seemed less skilled in the Indian languages, suspected that they were not all alike sagacious, and was persuaded that he himself was shielded against their powers by special protection of Heaven. A diabolical report which has pronounced witchcraft "the most nefandous high treason against the Majesty on high," was printed with a copious narrative of his recent researches, and the particulars were reprinted in London with a preface by Richard Baxter. When the first phenomena occurred at Salem in 1692, he at once became a prominent adviser concerning them, expressing his eagerness "to lift up a standard against the infernal enemy," whose assaults upon the country he regarded as "a particular defiance upon my poor endeavors to bring the souls of men unto heaven," and in order to convince all who doubted the obsessions and disapproved of the executions, he wrote his "Wonders of the Invisible World" (1692), which received the approbation of the president of Harvard college and of the governor of the state, though it was designed to encourage the excesses and to promote "a pious thankfulness to God for justice being so far executed among us." When the report in the popular mind followed, he vainly attempted to arrest it; and though he afterward admitted that "there had been a going too far in that affair," he never expressed regret for the innocent blood that had been shed, and charged the responsibility upon the powers of darkness. Finally, he sought to shun the odium of the popular feeling by declaring the subject "too dark and deep for ordinary comprehension," and referring it for decision to the day of judgment. By the publication of Robert Calef's "More Wonders of the Invisible World" (London, 1700), in which the veracity of many of the narratives of Mather was disputed, the delusion was at length dissipated. Though his influence declined, his activity continued. His publications amounted to 382, many of them small books and sermons. His Magnalia Christi Americana (London, 1702; 2 vols., Hartford, 1830) is a chaotic collection of materials for an ecclesiastical history of New England, concerning which he was admitted to know more particulars than any other man. In 1713 his Curiosa Americana was read before the royal society of London, and he was elected to that body, being the first American to receive this distinction. In its "Translations" in 1721 appeared an account of the practice of inoculation for the smallpox; and by the efforts of Mather in connection with Dr. Boylston against both professional and popular prejudice, the operation was first performed in Boston. His "Essays to Do Good" (1710) and his "Christian Philosopher" and "Directions for a Candidate of the Ministry" enjoyed high repute. His greatest undertaking was entitled "Illustrations of the Sacred Scriptures." He labored upon it from his 31st year to his death, and the manuscript is now in the library of the Massachusetts historical society. His life was written by his son, Samuel Mather (1729), and again by W. B. O. Peabody in Sparks's "American Biography." MATHEW, M., was born at Thomastown, county Tipperary, Ireland, Oct. 10, 1790, died Dec. 8, 1856. He was educated in an academy at Kilkenny and the college of Maynooth, and entered a Capuchin convent at Kilkenny, where he remained until after his ordination in 1814, when he was placed in charge of a chapel in Cork. His urban manners and charitable disposition soon acquired for him an extraordinary influence. He interested himself warmly in the condition of the lower classes, and organized a religious association for visiting the poor and sick, in which he induced numbers of young men to enroll themselves. In 1888 a Quaker first directed his attention to the necessity of suppressing intoxication. Soon afterward he was invited by several teetotalers in Cork to join them in devising a public crusade against drunkenness. A total abstinence society was formed, of which he was unanimously chosen president. Thirty-five persons took the pledge at his hands at once; on the following day several hundreds joined the society, and in the course of five months he administered the pledge at Cork alone.
to 150,000 converts. No small part of this success was due to Father Mathew’s personal popularity. He was invited to all parts of Ireland. In Limerick the crowds who came to hear him from the furthest parts of Connaught were so large, that but for the liberality of the citizens there would have been a famine in the place. He now gave up everything else to devote his life to the cause of temperance. At Galway he administered the pledge to 100,000 persons in two days, and after visiting every large town in Ireland he went to England, where he was received with the greatest enthusiasm. His benevolent labors had involved him deeply in debt, and although he received from the queen a pension of £300, most of it was applied to paying an insurance on his life for the benefit of his creditors. His brother, a wealthy distiller in Ireland, assisted him until his business was ruined by the progress of the temperance movement. After travelling and lecturing for some time in England with scarcely less success than in his native country, he visited the United States, lecturing in the principal cities, and returned to Ireland in the autumn of 1851.

A statue has been erected to him in the city of Cork, and in September, 1874, a movement was in progress in New York for the erection of a similar statue in Central Park.

MATHEWS. I. Charles, an English actor, born in London, June 28, 1776, died in Plymouth, June 28, 1835. He was educated at the merchant taylors’ school, and subsequently was apprenticed to his father, a bookseller. He gradually imbibed a predilection for the stage, and after appearing at several provincial theatres as an amateur, was engaged as a comedian at the theatre royal, Dublin. Meeting with unjust treatment here both from the manager and the public, he determined to return to his father’s business; but on the way to London he accepted an engagement at Swansea, where he performed for some time with success. After acting several years at York, he became a member of the Haymarket, company, and on May 16, 1808, made his début before a London audience as Jubal in “The Jew.” He performed for many years at the principal London theatres; but feeling that the parts assigned to him did not afford fair scope for his talents, he instituted in 1818, in imitation of Foote and Dibdin, a species of entertainment in the form of a monologue, which, under the title of “Mathevs at Home,” proved very successful. For five successive seasons he drew crowded audiences to the English opera house, where, by his comic songs, recitations, anecdotes of personal adventure, and imitations of well known actors, he greatly enhanced his reputation. In 1822–3 he made a successful tour in the United States, where he gathered materials for his “Trip to America,” which was received with not less favor than his “At Home.” He continued both entertainments for more than ten years longer, appearing at intervals on the stage in the regular drama; and in 1834 he returned to America and performed his “Trip.” He died soon after his return to England. His powers of mimicry, combined with an expressive countenance, a flexible voice, and keen discernment, gave him a high position on the English stage. His Mawworm, Sir Fretful Plagiary, Morbleu, Monsieur Mallet, Multiple in “The Actor of All Work,” &c., were among the most finished and original conceptions of the comic drama. His imitative powers were abundantly displayed in his “At Home,” which was written for him by various authors. In private life he was greatly esteemed, and possessed the friendship of Coleridge, Lamb, and other eminent men. His “Memoirs” were published by his widow (4 vols. 12mo, Philadelphia, 1839). II. Charles, son of the preceding, also a comedian, born in December, 1803. He was educated as an architect, but subsequently went upon the stage, and has for many years held a prominent place as a light comedian. In connection with his first wife, better known as Madame Vestris, who died in 1857, he was for years manager of the Olympic and Lyceum theatres in London. In 1857–8 he made a professional tour in the United States, where he married Mrs. Davenport, an actress, known as Lizzie Weston. In 1860 he withdrew for a time from the stage, and gave entertainments similar to those of his father, in which he was assisted by his wife. In 1868 he visited Paris and performed in a French version, made by himself, of one of his own plays. He visited the United States again in 1869 and 1871, going in the interim to Australia, and in 1873 returned to England, where his wife died in 1875.

MATHEWS, Cornelius, an American author, born at Port Chester, N. Y., Oct. 28, 1817. He graduated at the university of New York, and commenced his literary career in 1836 by contributions in prose and verse to various periodicals. In 1839 he published “Behemoth, a Legend of the Mound Builders; in 1840, “The Politician;” in 1841, “The Career of Puffer Hopkins,” a novel illustrating various phases of political life in New York. His remaining works comprise “Poems on Man in the Republic” (1843); “Big Abel and Little Manhattan” (1845); “Witchcraft,” a tragedy (1846); “Jacob Leiser,” a play (1848); “Moneypenny, or the Heart of the World” (1850); “Chanticleer, a Thanksgiving Story” (1860); “A Pen and Ink Panorama of New York City” (1852); “False Pretences,” a comedy (1856); and “Indian Fairy Tales” (1868). He has edited various journals and contributed largely to periodicals.
the Norse (4to, 1781), and in 1783 produced an "Essay on the Evidence relating to the Poems attributed to Thomas Rowley." In 1794 he published the first part of an anonymous poem, of which three other parts subsequently appeared, entitled "The Pursuits of Literature," remarkable for severe criticisms on literary men and opinions. It was followed by a variety of minor satirical pieces, after which he published an edition of the works of Thomas Gray, with his life and additions (2 vols. 4to, Cambridge, 1814). The latter part of his life was passed at Naples, where he published much in the Italian language and on Italian literature.

**MATSUMAE, or Matsutaka, a city of Japan, in Yezo, at the mouth of a small river on the S. coast, lat. 41° 30' N., lon. 140° 3' E., about 42 m. S. W. of Hakodate; pop. estimated at 50,000. It was the seat of the daimio Matsudaira Idu no Kami, and contains a castle, such as is usually found in a daimio's capital. It carries on a thriving trade with Hakodate, and with Awonomi on the main island, across the strait of Tsugaru. Next to Hakodate it is the largest town in Yezo. Matsumae derives its importance in the eyes of foreigners from the fact that here the Russian captain Golovnin was imprisoned from 1811 to 1815. The question of opening Matsumae as a port of foreign commerce was discussed by Commodore Perry with the Japanese in 1854, but without success. The name Matsumae was applied by some of the earlier navigators both to the island of Yezo and to the strait of Tsugaru.

**MATSYS, Metsys, or Messys, Quintin, a Flemish painter, born in Louvain about 1460, or according to some authorities in Antwerp in 1450, died in Antwerp about 1530. He was brought up as a blacksmith, in which trade he continued until about his 20th year, when, according to the popular story, he became enamored of a painter's daughter, and to win her hand forsook the anvil for the easel. He painted in the hard style of the early Flemish masters, colored highly, and was distinguished for minuteness of finish and force of expression, particularly in religious subjects; although elsewhere he exhibits a cheerful conception of life, and occasionally considerable humor. His chief work is the great altarpiece in the museum at Antwerp, consisting of a centre and two wings; in the former is represented the "Descent from the Cross," of which Sir Joshua Reynolds says: "There are heads in this picture not exceeded by Raphael;" the latter are devoted to incidents in the history of St. John the Baptist and St. John the Evangelist. The artist received but 300 florins for this work, but Philip II. subsequently endeavored in vain to purchase it, and Elizabeth of England is said to have offered 64,000 florins for it. One of his best authenticated works is that in Windsor castle known as "The Misers," of which several repetitions are in existence. The heads are painted in a masterly manner. About 70 pictures are ascribed to him, and these are widely distributed throughout the chief galleries of Europe, and are highly prized.

**MATTERHORN, or Mont Cervin, a French philosopher and historian, born at Alt-Eckendorf, Alsace, May 31, 1791, died in Strasbourg, June 28, 1864. He was intended for the legal profession, and after studying under private tutors and at the gymnasium of Strasbourg and the university of Göttingen, he went to Paris, where he attended the lectures of the faculty of letters, and wrote his Essai historique sur l'école d'Alexandrie, which received a prize from the academy in 1816, and was published in 1820. By favor of Royer-Collard and Guizot he received in 1819 a professorship in the college of Strasbourg, which he exchanged two years afterward for the direction of the gymnasium and the professorship of ecclesiastical history in the Protestant academy of the same city. He published Histoire critique du gnosticisme (2 vols., Paris, 1828), and Histoire universelle de l'Église chrétienne (3 vols., 1829-'32). In 1828 he was appointed inspector of the academy of Strasbourg, and in 1831 corresponding member of the academy of inscriptions. His treatise De l'influence des maurs sur les lois et des lois sur les maurs (Paris, 1832) received from the academy an extraordinary prize of 10,000 francs. In 1832 he was appointed by Guizot inspector of the university of Paris; in 1845 he became inspector general of public libraries, and subsequently he devoted himself to literary labors at Strasbourg. Among his other works are: Histoire des doctrines morales et politiques des trois derniers siècles (3 vols., 1836-'7); De l'affaissement des idées et des études morales (1841); Schelling et la philosophie de la nature (1842); De l'état moral, politique et littéraire de l'Allemagne (2 vols., 1847); Histoire de la philosophie dans ses rapports avec la religion (1864); Philosophie de la religion physique (2 vols., 1854); Philosophie de l'histoire en général, et la philosophie des maurs (1860); Saint-Martin, le philosophe inconnu (1865); and Emmanuel de Swedenborg (1863).

**MATTERHORN (Fr. Mont Cervin; Itl. Monte Silvio), a mountain of the Pennine Alps, between the canton of Valais, Switzerland, and the Val d'Aosta, Italy, 14,885 ft. high. It is one of the grandest peaks in the world. In the view from the Riffel its precipices rise 4,000 ft. to a summit which appears like the wall and steep roof of a house. From Breuil, in the Val Tournanche, the whole Italian face is a series of terraced walls. From the north and south the mountain appears like a tower, and from the east and west it has the form of an obelisk. At the height of 11,096 ft. is the pass of Mont Cervin, traversed in summer by mules and horses, and exhibiting the remains of rude fortifications, supposed to have been erected two or three centuries ago as a defence against incursions from the Valais. Up to 1865 the Matterhorn was the last of the great Alpine peaks that remained unseated. The first attempts to ascend it were made by
guides from the direction of Breuil in 1858 and 1859, and the highest point attained was the "Chimney," about 12,650 ft. In July, 1860, three Englishmen, Alfred, Charles, and Sandbach Parker, of Liverpool, without guides, ascended 12,000 ft. In August Prof. John Tyndall and Vaughan Hawkins accomplished 12,992 ft. In July 1861, the Messrs. Parker made another effort, and reached a few feet beyond the point attained by them the previous year. In August Edward Whymper ascended to the "Chimney." In July, 1862, Tyndall ascended 13,970 ft. In 1863 and 1864 Whymper made unsuccessful attempts to reach the summit. On July 14, 1866, Mr. Whymper, Lord Francis Douglas, the Rev. Charles Hudson, Mr. Hadow, and four guides started from Zermatt, and on the day following accomplished the ascent. In descending the Matterhorn the rope connecting the party broke, and Michel Croz, one of the guides, Lord F. Douglas, and Messrs. Hudson and Hadow were plunged down a precipice 4,000 ft. The body of Douglas was never found; the others were buried at Zermatt. Three days later (July 17) a successful ascent was made from Breuil by Jean Antoine Carrel and others. The next ascent was made in August, 1867, by Cranford Grove. In July, 1868, Mr. Elliott with two guides reached the summit from the north side; and in the same summer Prof. Tyndall was the first to effect the passage of the mountain across the crest from Breuil to Zermatt. The crest of the Matterhorn is a line of snow, 580 ft. long, and 6 ft. higher toward the east than toward the west. On the eastern face a hut has been built at a height of 12,526 ft., and since 1868 numerous ascents have been made.

MATTEUCCI, Carlo, an Italian savant, born in Forli, June 21, 1811, died in Leghorn in June, 1868. He studied at Bologna and in Paris, returned to Forli in 1831, and there began his scientific experiments. He removed to Florence in 1834, and in 1837 became professor of physics and director of the laboratory at Ravenna, and in 1840 professor of physics at Pisa. For his experiments in electro-physiology he took a prize at the French academy of sciences in 1844, and also the Copley medal of the royal society of London. He constructed the first line of telegraph in Tuscany, in 1846, and was made superintendent of the telegraph service. He became a senator in 1848, a member of the council in 1859, and after the establishment of the kingdom of Italy a member of the national senate and inspector general of telegraphs, and in March, 1862, minister of public instruction. His principal works are on the phenomena of electro-physiology (1840), physics, electricity applied to the arts, and the physico-chemical phenomena of living bodies.

MATTHEW, Saint, one of the twelve apostles, and author of the first Gospel. The New Testament tells us little of his personal history. He was a son of Alpheus, and a receiver of customs at the lake of Tiberias. Jesus, while passing one day, said to him: "Follow me;" and Matthew at once obeyed. Most exegetical writers assume that the publican Levi, whose call to the discipleship is recorded by Mark and Luke, is the same person as Matthew; but among the opponents of this view are Origen, Grotius, Michaelis, and Ewald. After the ascension of Christ, Matthew was at Jerusalem, with the other apostles. Then history loses sight of him. Tradition relates that he preached the gospel for 15 years in Jerusalem, and then turned to other nations. Among these are mentioned the Ethiopians, Macedonians, Syrians, Persians, Parthians, and Medes. He is said to have been burned alive in Arabia Felix; and according to Baronius, his body was brought to Palermo in 954. The Roman Catholic church keeps his festival on Sept. 21, the Greek on Nov. 16.—The Gospel of Matthew, according to the unanimous tradition of the ancient church, was composed in Hebrew, or rather the Syro-Chaldaic idiom spoken at that time in Palestine. Following Erasmus, many eminent Protestant theologians, as Calvin, Beza, Lightfoot, Credner, De Wette, Ewald, Harless, Bleek, Schenkel, Keim, and Volkmar, and among Roman Catholics Hug, have contested the correctness of this tradition, and advocated the originality of the Greek text; but the opposite theory has also found defenders, prominent among whom are Meyer and Lange. A considerable number of distinguished theo-
logians, as Lachmann, Credner, Ewald, Reuss, Meyer, Bleek, Bunsen, Schenkel, Keim, and generally all the theologians of the Tübingen school, infer from a passage of the early ecclesiastical writer Papias, that Matthew himself compiled only a summary of the sermons and sayings of Christ, which was put into historical form by another writer. But weighty authorities have since shown that this passage of Papias admits of another interpretation. The Gospel was undoubtedly written for Christians of Jewish descent in Palestine. With respect to its date ecclesiastical traditions vary from A. D. 41 to 67; a majority of modern writers seem to agree in fixing it between 60 and 67. The chief aim of this Gospel is evidently to prove the Messianic character of Jesus. For its relation to the Gospels of Mark and Luke, see Mark; for collective commentaries on all the four, or the first three Gospels, see Luke.—See Sieffert, Uber die Echtheit und den Ursprung des ersten canonischen Evangeliums (1892); Schneckeburger, Uber den Ursprung des ersten Evangelii (1834); Schott, Uber die Authenticität des canonischen Evangeliums nach Matthäus benannt (1887); Kern, Uber den Ursprung des Evangeliums Matthäi (1837); and Holtzmann, Die synoptischen Evangelien (1863).

MATTHIAS, or Matthew of Paris (Lat. Matthaus Parisiensis, so called from his having studied in that city), an English historian, born about 1195, died in 1259. From 1317 he was a Benedictine monk of St. Albans, where he continued the Flores Historiarum of Roger of Wendover from 1235 to 1259, adding a nearly equal amount of his own to the original. This, known as the Historia Major, was first printed by Archbishop Parker in 1571, and an edition by Dr. William Watts (fol., London, 1640; Paris, 1644). Matthew Paris made a compilation from it, extending from 1066 to 1253, known as the Historia Minor, the Chronicum, and the Liber Chronicorum, which Sir Frederick Madden published under the title Historia Anglicana (London, 1864), from the original in the British museum. An original manuscript of the Flores Historiarum, discovered in the Chetham library at Manchester, according to Sir Francis Madden, settles beyond doubt that the largest portion of that work, attributed to "the pseudo Matthew of Westminster," was written at St. Albans, under the eye of Matthew Paris, as an abridgment of his "Greater Chronicle," and the text from the close of 1241 to 1249 is in his own handwriting. It was continued by monks of St. Albans to 1265, and to 1325 at Westminster, whence the name Matthew of Westminster, otherwise unknown, became attached to it. The Historia Major has been translated into English by the Rev. J. A. Giles (5 vols. 8vo, London, 1849-54), and the Flores Historiarum by C. D. Yonge (2 vols. 8vo, 1853).

MATTHEWS, an E. county of Virginia, bordering on Chesapeake bay; area, 68 sq. m.; pop. in 1870, 6,209, of whom 2,996 were colored. It is a peninsula, having the Piankatank river on the N., the Chesapeake on the E., and Mobjack bay on the S. W., and is connected with the mainland by an isthmus 1 m. wide; length 20 m. greatest width 8 m. It has a level surface and moderately fertile soil. The chief productions in 1870 were 3,268 bushels of wheat, 104,867 of Indian corn, and 13,577 of oats. There were 390 horses, 2,269 cattle, 957 sheep, and 4,065 swine. Capital, Matthews.

MATTHIAS, a religious impostor, whose real name was Robert Matthews, born in Washington co., N. Y., about 1790, died in Arkansas. He kept a country store, failed in 1816, and went to reside in New York. In 1827 he removed to Albany, where he became excited by the preaching of the Rev. Messrs. Kirk and Finney. He engaged in the temperance cause, and, claiming to have received a revelation, took to street preaching. Failing to convert Albany, he proselyted its destruction and fled to New York, where he involved several respectable families in his delusions, and was tried and acquitted on a charge of poisoning a wealthy disciple in whose family he lived. His impositions having been exposed, he disappeared.—See "Matthias and his Imposture," by W. L. Stone (New York, 1839).

MATTHIAS, emperor of Germany, born Feb. 24, 1557, died March 29, 1618. His mother was a daughter of the emperor Charles V. His father was Maximilian II., who died in 1576, and was succeeded by his eldest son Rudolph II., whose jealousy of his brother's participation in affairs at home had early impelled Matthias to espouse the cause of the revolted Netherlands; and he was their nominal ruler from 1577 to 1680, when he withdrew before the superior influence of the prince of Orange. The death of his brother Ernest, archduke of Austria (1605), brought him into prominence, Rudolph intrusting him with the administration of that archduchy. He was notorious for his persecution of the Protestants. Commissioned by the emperor he honored tranquility in 1606 among the Hungarians, who had invoked the aid of Boesky of Transylvania and of the Turks against the house of Hapsburg; and in 1608, having formed a confederation of the Hungarian, Moravian, and Silesian estates, he forced Rudolph to cede to him Hungary, Moravia, and Austria, and to secure to him the succession to the kingdom of Bohemia. He now sought to propitiate the Protestants in order to obtain this concession; and subsequently, when Rudolph manifested a preference for the archduke Leopold as future king of Bohemia, Matthias seduced the disaffected Bohemians against his brother, and secured from him the cession not only of Bohemia, but also of Silesia and Lusatia. His brother leaving no issue, Matthias was unanimously elected (June, 1612) to succeed him as emperor. He was unable to grapple with the Turks in Hungary, whose advance on Vienna was only arrested by
his suit for peace in 1615. He was equally unfortunate in his attempts to assert the religious strife to which he had not a little contributed by countenancing his brother's support of the Jesuits. After failing to transfer the Catholic league (formed in 1609) from Bavarian to Austrian control, he issued a decree (April, 1617) against this as well as the rival Protestant association established in 1608 under the lead of the count palatine Frederick IV. Both disregarded his decree, and his failing health offered a convenient pretext for substituting the archduke Ferdinand as king of Bohemia (1617) and Hungary (1618). But the bigotry of this prince (the future emperor Ferdinand II.) resulted in the outbreak in Prague (May 23, 1618), which kindled the flames of the thirty years' war. His death took place at a time when the revolted Bohemians had gained considerable advantages.

MATTHIAS I, the Great, surnamed CORVINUS, king of Hungary, born in 1443, died in Vienna in 1490. He was a son of John Hunyady (Hun nitrogen), the governor of Hungary during the minority of King Ladislas the Posthumous. His elder brother Ladislas perished on the scaffold by order of that king, but he succeeded the latter on the throne by election in 1458, after having been previously detained as a prisoner in Bohemia by the adversaries of his house. He met with bitter opposition on the part of many powerful nobles, who in 1459 elected the emperor Frederick III. as rival king. Matthias, however, prevailed upon Frederick to surrender to him the crown of St. Stephen; and he next expelled the Turks, who had availed themselves of the intestine troubles to invade the country. He restored order in the kingdom with a firm hand. He confirmed the license of the nobles with rigor. He had married a daughter of George Podiebrad, king of Bohemia, but was induced by ambition and the entreaties of the court of Rome to fight his own father-in-law, who had been excommunicated as a Hussite in 1463, and afterward declared deposed by the new pope Paul II., a crusade being preached against him throughout the German empire. Podiebrad repulsed the invasion of Bohemia by Matthias, and concluded an armistice with him in April, 1469; but the latter, being chosen king of Bohemia by a mock diet at Olmütz, without effect, renewed hostilities, which did not terminate till July, 1470. In the mean time Matthias had wrested from Podiebrad Moravia, Silesia, and Lusatia (1468-'70); he also vanquished the Poles, and in 1485-'6 wrested Vienna and a large part of Lower Austria from the emperor Frederick. The enormous expenses of these wars entailed heavy burdens upon his subjects; but his rule, though arbitrary, was so eminently judicious and popular that the economic prosperity of the empire is characterized by the saying: "King Matthias gone, justice gone." Hungary enjoyed under his influence an era of unprecedented prosperity and prestige in Europe as the great bulwark against the Turks. At the same time he promoted letters and science more thoroughly than any other potentate of his day. He protected his countrymen, invited Germans, and founded the university of Buda, acquired Greek manuscripts, and employed numerous copyists at Florence and Buda to add valuable materials to the royal library. Its partial destruction by the Turks in 1527 was a great calamity, especially as only a small portion of it found its way to Vienna.—John Corvinus, a natural son of Matthias, attempted to succeed to the throne, which was occupied after the latter's death by Vladislas II.

MATTHIAS, John. See ANABAPTISTS.

MATTHISSON, Friedrich von, a German lyric poet, born near Magdaland, Jan. 23, 1761, died near Dessau, March 12, 1811. Having developed considerable talents as a poet, and gaining great popularity, he was patronized by various German princes, but retired from court life in 1824. His "Elegy in the Ruins of an Old Castle" is one of his finest lyrics. He edited selections from the lyric poets of Germany under the title of Lyrische Anthologie (20 vols., Zürich, 1809-7). His Erinnerungen und Schriften were published at Zürich (5 vols., 1810-16, and 8 vols., 1825-31), and his posthumous works at Berlin (4 vols., 1829).

MATTISON, Hiram, an American clergyman, born in Norway, N. Y., Feb. 11, 1811, died in Jersey City, N. J., Nov. 24, 1868. He entered the Methodist ministry in 1835, and in 1836 joined the Black River conference. In 1841 he was appointed agent of the American Bible society for the state of New Jersey. Resuming the pastorate in 1842, he was successively stationed at Watertown and Rome, N. Y. From 1846 to 1850 he was chiefly employed in the preparation of works on astronomy, in lecturing, and in supplying the John street church, New York; but in 1856-'7 he was pastor at Adams and Syracuse, and took a leading part in the anti-slavery movement. In 1859, by correspondence with the Methodists of Great Britain, he obtained the names of about 85,000 petitioners to the general conference of 1860, praying that body to extirpate slavery from the Methodist Episcopal church; and a like paper from 45,000 petitioners in central New York was largely due to his efforts. In November, 1861, he withdrew from the Methodist Episcopal church, because, as he affirmed, of its toleration of slaveholding; and soon after he became pastor of St. John's Independent Methodist church, New York. In 1865 he returned to the former church, and was stationed at Jersey City, where he was prominent in his opposition to the claims of the Roman Catholic church. This led to his appointment in 1866 as one of the district secretaries of the American and foreign Christian union. Among his works are: "The Torrey and Modern Arminian," and "Tracts for the Times" (1843); "Elementary Astronomy, accompanied by Maps" (1846); "Burritt's Geography of the Heavens," edited and revised (1856); "High
School Astronomy" (1853); "Spirit Rapping Unveiled" (1854); "Sacred Melodies," and "Impending Crisis" (1859); "Mortality of the Soul"; "Resurrection of the Body," and "Defence of American Methodism" (1866); and "Popular Amusements" (1867).

MATTO GROSSO (Port., thick brushwood), a province of Brazil, bounded N. W. and N. by Amazonas and Grão Pará, E. and S. E. by Goiás, São Paulo, and Paraná, S. by Paraguay, and S. W. and W. by Bolivia; area, 551,575 sq. m.; pop. about 100,000. This province, the largest in the empire after Amazonas, forms the western portion of the highlands of Brazil, comprising the Amazon-Paraguay watershed, which is so low that canoes ascending the Tapajós from Santarem are crossed over and floated on the Paraguay to descend to Villa Maria. From the transversal ridge forming the watershed just referred to are several minor chains stretching N. and S., separated by deep valleys and immense plains covered with dense forests, which give the name to the province, and afford inexhaustible quantities of timber suited for every species of construction, and a great variety of precious cabinet woods. The Tapajós and Xingú rivers rise in the N. W. part and flow N. to the Amazon, while the Paraguay flows southward, forming part of the S. W. boundary line, and all receive the waters of innumerable streams, which elsewhere would rank as grand rivers. The Guaporé or Iténez forms with the Madeira almost the whole of the remainder of the western boundary; and the eastern and southern boundaries are constituted by the Araguaú and Paraná respectively. Gold is found in nearly every direction; but the mines, like those of diamonds, once extensively worked, especially in the region around Cuyabá, are now mostly abandoned owing to the cost of working them, as the gems and the gold no longer occur near the surface. Copper, iron, and many other metals abound in the hills. The soil is extremely fertile, and the chief occupations of the inhabitants are agriculture and cattle raising. The principal commodities exported are hides, ipêcaçuana and other drugs, and balsams, all of which are sent to Rio de Janeiro by caravans of mules. Millet, rice, and manioc are cultivated, as are also sugar, tobacco, and cotton. The chief impediment to colonization is the absence of adequate means of transport to the centres of consumption and the seacoast. Capital, Cuyabá.

MATERIN, Charles Robert, an Irish author, born in Dublin in 1782, died there, Oct. 30, 1824. He was educated at Trinity college, Dublin, took orders, and became curate of St. Peter's in his native city. In 1807 he published "The Fatal Revenge, or the Family of Montorio," a novel, which was followed by several other romantic fictions, as "The Milestone Chief," "The Wild Irish Boy," "The Woman, or Pour et Contre," and "Melmoth the Wanderer." In 1816 his tragedy of "Bertram" was accepted at Drury Lane theatre, through the influence of Lord Byron. He was noted for eloquence in the pulpit.—His son Edward emigrated to America, where he published several poems and tales, among which are: "Montezuma, the Last of the Aztecs;" "Benjamin, the Jew of Granada;" "Eva, or Isles of Life and Death" (1848); and "Bianca, a Tale of Erin and Italy" (1853).

MAUBEUGE, a fortified town of France, in the department of L'Est, on the Sambre, 46 m. S. E. of Lille; pop. in 1856, 10,877. It is well built, and has long been important in a military point of view. Its fortifications were reconstructed by Vauban in 1680. After the battle of Waterloo it was captured by the Prussians. It has iron foundries, tanneries, salt refineries, and marble works.

MAUCH CHUNK, a borough and the capital of Carbon co., Pennsylvania, on the W. bank of the Lehigh river, at its passage through the Mahoning mountain, on both sides of the mouth of Mauch Chunk creek, 46 m. above the entrance of the Lehigh into Delaware river, and on the Lehigh canal and the Lehigh Valley railroad and the Central railroad of New Jersey, 551,575 ft. by railroad, 551,575 ft. by Philadelphia, and 121 m. W. of New York; pop. in 1870, 3,841. It is built chiefly in the valley of the creek, on a single street, between the Mahoning and Sharp mountains, in so contracted a place that little room is afforded for gardens to the houses. The hills on each side rise precipitously to the height of several hundred feet, and not far back attain an elevation of more than 1,000 ft. above the river. The place derives its importance from the mines of anthracite found in the Sharp mountain at this eastern extremity of the southern anthracite field of Pennsylvania. The summit of South Mountain, 9 m. W. of the village, up the valley of Mauch Chunk creek, have been famous as among the oldest known and most productive of the coal mines in the state. One bed more than 50 ft. thick has been worked over many acres. The coal from these mines was formerly taken to Mauch Chunk over the famous "Switchback" gravity railroad, and thence transferred by chutes to the Lehigh canal. The cars run by gravity the whole distance to Mauch Chunk, and were formerly drawn back by mules, which made the descent in cars provided for them. But a return track is now laid, along which the cars descend from the chutes at the canal to the foot of Mt. Pisgah, the high point of Sharp mountain next the river, and are then raised to its summit up an inclined plane by a stationary steam engine. From this point they then run 6 m. by gravity to the foot of another inclined plane, up which they are raised as before, and from its summit descend to the different mines. This road has been superseded by a tunnel at Nesquehoning, and it is now only used for pleasure excursions. The Lehigh canal, with the slackwater navigation of the Lehigh, was formerly continued 25 m. further.
up the river to Whiteshavon, but having been destroyed by a flood it is now abandoned above Mauch Chunk. The coal mines and furnaces in the vicinity and the Lehigh Valley railroad are controlled largely by residents of the borough. It contains several handsome houses, a fine public school house, court house, jail, two founderies and machine shops, a flour mill, two national banks, a private bank, two weekly newspapers, a library, and five churches. The beauty of the scenery, the coolness and purity of the air, and the excellence of the water have rendered it a famous summer resort. Glen Onoko, near the borough, a wild and beautiful ravine, is a prominent attraction. The borough limits being circumscribed, the

population has extended to Upper Mauch Chunk, on a plateau above the town, and to East Mauch Chunk, a borough on the E. bank of the Lehigh, having 1,585 inhabitants in 1870. The population of the township of Mauch Chunk, on both banks of the river, exclusive of the boroughs, was 5,210. The name is of Indian origin, and its meaning is said to be Great Bear.

MAUDSLEY, Henry, an English physiologist, born near Selte, Yorkshire, in 1855. He studied medicine at University college, London, and received the degree of M. D. in 1858. He became resident physician of the Manchester lunatic hospital in 1859, which post he retained till 1862, when he commenced a consulting practice in London. He is now (1875) professor of medical jurisprudence in University college, consulting physician to the West London hospital, and editor of the "Journal of Mental Science." His principal works are: "Physiology and Pathology of Mind" (London, 1867); "The Gulstonian Lectures on Body and Mind" (London, 1870); and "Responsibility in Mental Disease," written for the "International Scientific Series" (London and New York, 1874).

MAUI, the second in size of the Hawaiian islands, in lat. 21° N., lon. 150° 30' W.; length 50 m., greatest breadth 27 m.; area, 603 sq. m.; pop. in 1872, 12,384. It is of volcanic formation, and consists of two mountains connected by an isthmus. East Maui is the larger. Its chief summit, Hale-a-ka-la ("house of the sun"), is 10,200 ft. high, and contains a crater 27 m. in circumference and 2,000 ft. deep. Abundant undecomposed lavas are found in it, but no tradition remains of its activity. The mountain is very regular in its slopes, which vary from 8° to 10°, and are the steeper on the windward or N. E. side, where they are cut up into deep ravines and worn away by the action of the strong trade winds and the rain. West Maui is of still older formation. There is no summit crater; it has a more broken surface and a deeper soil, and the degradation is more extensive. Its highest peak is about 6,000 ft. The connecting isthmus is a low sandy plain, rising but a few feet above the sea; vessels have run upon it by night, supposing a passage to exist. Sugar culture is the chief industry of Maui. The soil, with proper treatment, appears to be inexhaustible, and there is no danger of frost.

The custom of the planters is to take off two crops and then let the field lie fallow for two years; four tons of sugar to the acre is not an uncommon yield. The cane matures, according to the altitude, in from 14 to 24 months. Owing to bad management, however, the plantations are often unsuccessful. The principal town is Lahaina, on West Maui; pop. 3,000.

MAULE, a S. province of Chili, bounded N. by Talca, E. by the Andes, S. by Nuble and Concepcion, and W. by the Pacific; area, 6,424 sq. m., or according to a Chilian authority, about 8,100 sq. m.; pop. in 1870, 211,567. The surface to the east is roughened by numerous hills; to the west it is traversed from N. to S. by the coast mountains; and in the centre it is a magnificent champaign coun-
try, highly cultivated, and affording excellent pasture for numerous cattle. The Manle, which rises in a lagoon near the base of the Descabezado peak, and forms the boundary line with Talca, is a considerable river, but is only navigable 30 m. for small vessels, on account of its numerous rapids and a bar at its mouth. Many irrigating canals branch from it, and flour mills abound along its banks. The Itata and Perquilauquen separate the province respectively from Concepcion and Nuble. There are several smaller rivers and numerous mountain torrents. The climate is temperate. The hilly region is for the most part covered with forests, yielding among others a species of timber eminently adapted for ship building, being remarkably strong and durable; and many ships are built along the coast. The principal productions are wheat, barley, maize, garden vegetables, &c., which, with good wines, cheese, and salt, are sent in large quantities to the neighboring provinces, but especially to Valparaiso, between which port and that of Constitucion an extensive trading coast is carried on. Gold mining, which was active in the last century, has nearly ceased. There are many mineral springs. The province is divided into the departments of Cauquenes, Constitucion, Itata, Linares, and Parral. The capital is Cauquenes, and the ports are Constitucion (the largest) on the Manle, Curanipe, and Huchipureo. A line of railway across the province, from Curicó to Chillán, is in course of construction (1874).

MAULMAIN, or MOULMEEN, a port of Tenasserim, on the E. side of the bay of Bengal, at the mouth of the Salwen, on a small peninsula formed by that river and the Gyn and Atta-ran, and nearly opposite the Burmese town of Martaban; lat. 16° 30' N., lon. 97° 37' E.; pop. about 50,000. The banks of the Salwen are lined with jungle from its mouth to the town, and the horizon is bounded, at the distance of from 1 to 6 m., by hills parallel with the stream, covered with trees to their summits. The native houses are raised on piles, 10 or 12 ft. from the ground, and are formed of mats and palm leaves. The houses of the Europeans and those of the wealthier Burmans are built entirely of wood, also raised upon piles. There are a few scattered brick buildings. The native town consists of one long street, which runs for nearly 4 m. along the bank of the Salwen, and a few others which branch from it toward the heights on the east and connect it with the European houses. There are several wooden jetties along the shore. The inhabitants consist of Burmans, Talains, Chinese, Bengalese, and Madrasese, with a few Armenians, Jews, and Cingalese. A considerable number of Europeans are settled there, and a few missionaries. There are seven Christian churches, five of which are Protestant. Maulmain is a place of considerable trade, principally with Calcutta, Madras, Rangoon, and Penang. The exports consist chiefly of timber, ivory, wax, stick lac, caoutchouc, cajeput oil, gum resins, nut oil, sandal wood, dammar, tanning substances and dyes, aloes, and sapan wood. With the exception of timber, all the articles used in ship building are imported, besides cotton cloth, coarse earthenware, sugar, tobacco, arms, and gunpowder. The forests in the immediate neighborhood yield an abundant supply of teak timber, and ship building is successfully carried on. When the Tenasserim provinces were ceded by the Burmese to the British in 1826, the site upon which Maulmain stands was covered with jungle overrun by tigers. The heat is not so oppressive as on the coast of Coromandel, the thermometer seldom rising above 90° in the shade.

MAUNA KEA, the highest mountain in the Hawaiian islands and in Polynesia; elevation, as estimated by the United States exploring expedition, 13,883 ft. It occupies the northern and central parts of Hawaii, and is a dome of volcanic formation, with terminal craters that have long been extinct. Though steeper and apparently rougher in surface than Mauna Loa, it is easier to ascend, owing to the greater degradation of the lavas which form its slope. Snow rests upon it during the greater part of the year. The terminal peaks are truncated cones of gravel and reddish scorin; the angle of their outer slope is about 30°. Herds of wild cattle roam in the forests that cover the flanks of the mountain, and are hunted for the sake of their horns, hides, and tallow.

MAUNA LOA ("long or high mountain"), a volcanic mountain occupying a large part of the central and southern regions of the island of Hawaii; elevation, 13,760 ft. It is entirely composed of lavas which have been thrown out in a highly fluid state, and which in consequence have flowed laterally with such freedom as to build up a mountain with extremely gentle slopes, averaging, according to Prof. Dana, but 6° 30'; the declivity upon the E. side is somewhat the steepest. It presents the appearance of a smooth, regular dome, usually crowned with snow, and partially forest-clad. On the east the forests cease at the elevation of 5,000 ft. Vegetation reaches to the height of 7,000 and 10,000 ft. on the leeward and windward sides respectively. The surface of Mauna Loa is composed of recent lavas in three forms: 1, the pahoehoe or "satw lava," a dense and solid rock; 2, scoriaceous lava, or "clinkers;" 3, a black slag or spongy lava, of the horrible roughness and hardness of which it is difficult to convey any idea. Its craters are numerous, occurring near the summit and on the sides; new ones sometimes open, and are the source of the grandest of the Hawaiian eruptions. The terminal crater, Moku-weo-woe, is circular, 8,000 ft. in diameter, with two lateral depressions which increase its dimensions in the N. and S. direction to 13,000 ft. It was about 1,000 ft. deep in 1864, with nearly perpendicular walls. Eruptions from Mauna Loa often take the form of enormous lava
fountains, spouting continuously from the top of the mountain. In February, 1859, such a fountain played actively for four or five days, throwing up a sheaf of white-hot fluid lava about 200 ft. in diameter, and 200 or 300 ft. high, illuminating the horizon at a distance of 160 m. In April, 1868, the lavas forced their way 20 m. under ground, and appeared near the S. point of the island, bursting forth through a fissure 2 m. long, which ran N. and S. On the 10th Mr. H. M. Whitney observed four enormous lava fountains continuously spouting up from this opening. Two of them occasionally united laterally; and sometimes the whole four joined in one, making a continuous fountain a mile long. It boiled with the most terrific fury, throwing up enormous columns of crimson lava and red-hot rock to the height of 500 or 600 ft. The lava was ejected with a rotary motion, uniformly toward the south. Mauna Loa has been seen at sea from a distance of 55 leagues; "the most striking example I have yet known," says Humboldt, "of the visibility of a mountain.

MAUNDY THURSDAY. See HOLY WEEK.

MAUPERTUIS, Pierre Louis Moreau de, a French astronomer, born in St. Malo, July 17, 1698, died in Basel, July 27, 1759. He was five years in the army, but he resigned in 1729, and was admitted into the academy of sciences. His ability in opposing the physical theory of Descartes, and substituting for it that of Newton, gained him admission in 1727 into the royal society of London. The controversy had excited public interest, when the French government resolved to verify one of the hypotheses of the British philosopher, that of the flattening of the terrestrial globe near the poles. Maupertuis was at the head of a commission of academicians, including Clairaut and Lemonnier, which in 1759–7 measured an arc of a meridian in Lapland; and the result, confirming the conjecture of Newton, gave him distinction throughout Europe. He was invited by Frederick the Great to Berlin, where he became president of the academy, married a lady of a distinguished family, and received large pensions. In 1750 he became involved in a controversy with König, who disputed one of the principles of Maupertuis and maintained that it was a plagiarism from Leibnitz. The latter years of his life were afflicted by illness.

MAUR, Congregation of St. See SAINT-MAUR.

MAUREPAS, Jean Frédéric Phelypeaux, count, a French statesman, born July 9, 1701, died Nov. 21, 1781. He was grandson of the chancellor Pontchartrain, and at the age of 14 succeeded his father as secretary of state, the administration of the office being intrusted to the marquis de La Vrillière till 1725, when he became the acting minister. He discharged the duties of this office till 1749, embellished the capital, sent La Condamine, Bouguer, and others to measure an arc of the meridian in Peru, near the equator, and Maupertuis, Clairaut, and others to measure an arc in Lapland. He also promoted the expeditions of Fourmont to Greece and the Orient, and of Jussieu to Peru. An epigram which he wrote upon Mme. de Pompadour caused his banishment from court for 25 years. He was recalled by Louis XVI., again became president of the council of state, restored the exiled parliaments, called Turgot and Necker successively into the ministry, but by his fickle and frivolous administration hastened the catastrophe of the French revolution. The Mémoires du comte de Maurepas was published by the abbé Soulavie (4 vols., Paris, 1792).

MAUREE. 1. Georg Ludwig von, a German jurist, born at Erpolsheim, Rhenish Bavaria, Nov. 2, 1790, died in Munich, May 9, 1872. He took his degree at Heidelberg in 1812, and studied in Paris till 1814. He was subsequently assistant attorney general in various places till 1826, when he became professor at the university of Munich. Having been made councillor of state, he was from 1823 to 1834 a member of the regency in Athens, Greece, and distinguished himself by drawing up most of the codes of law. In 1847 he was for a short time minister of foreign affairs and of justice. Among his numerous works are Das griechische Volk (3 vols., Heidelberg, 1838), and Geschichte der Städteverfassung in Deutschland (4 vols., Erlangen, 1869–71). H. Konrad, a German author, sum of the preceding, born at Frankenthal in 1823. In 1847 he became professor of jurisprudence at Heidelberg. He is a high authority on early Scandinavian history, laws, languages, and literature. His principal works are: Die Entstehung des isländischen Staats und seiner Verfassung (Munich, 1852); Die Bekehrung des norwegischen Stammes zum Christentum (2 vols., 1855–60); an edition of the Islandic Gullthöfamilyga (Leipsic, 1858); and Islandische Volkskunde der Gotenzeit (1855).

MAURETANIA. See MAURETANIA.

MAURICE, count of Nassau and prince of Orange, statholder of the United Dutch Provinces, born at Dillenburg, Nov. 14, 1567, died at the Hague, April 23, 1625. He was the second surviving son of William I. of Orange, surnamed the Silent, by Anna, the daughter of Maurice of Saxony. Maurice of Nassau was in his 17th year when his father was assassinated (1584), and was soon after proclaimed governor and captain general by the states of Holland and Zealand, his elder brother Philip William having been carried by the duke of Alva to Spain. Maurice, though commencing his military career under the control of the count of Hohenlohe, was elected by the states in 1587 governor and commander-in-chief of the republic, during the temporary absence of Leicester; and after the recall of Leicester by Queen Elizabeth he was acknowledged as statholder and commander-in-chief by all the provinces, Lord Willoughby commanding the English auxiliary forces. Opposed to the greatest captain of that period, Alessandro Farnese, Maurice
surprised and captured Breda (1590), and in the following year took Zutphen, Deventer, Nimmen, and other places. The conquest of Gertruidenberg (1593) and Groningen (1594), after protracted sieges, manifested still more clearly his abilities; and his camp soon became, like that of the duke of Parma, who died in 1592, one of the great schools of the military art, to which warlike youth flocked from every Protestant country. In these and many subsequent conquests, Maurice was assisted by the English auxiliary troops under Sir Francis Vere, and he was still more indebted to the aid of the latter in his first battle in the open field, before Turnhout in Brabant, where he routed the Spaniards and compelled the fortress to surrender (1597). In 1598 Albert of Austria, governor of the Netherlands in right of his wife Isabella, on whom the sovereignty had been bestowed by her father Philip II., demanded from the United Provinces a voluntary submission to their new rulers. The republic answered only by a more vigorous prosecution of the war by land and sea. Maurice routed the archduke at Nieupoort near Ostend (1600), the issue of the battle being long disputed, and the English under Sir Francis Vere claiming the principal honor of the victory. The Protestant army, however, was exhausted, and Albert was allowed to resume the field with superior forces, and to commence the siege of Ostend, while Maurice successively laid siege to other places. The resistance of Ostend lasted more than three years; but when the Italian Spinola took the command of the besieging army, all efforts to save the fortress proved vain, and an honorable capitulation ended the struggle, which had cost the king of Spain 80,000 men. Maurice had in the mean while achieved numerous conquests, which more than balanced the loss of Ostend, and the Dutch colonial possessions had been much extended, largely at the expense of Spain and Portugal. Spinola himself advising peace, Philip III. at last yielded, and a truce for 12 years was concluded at the Hague (1609), under which the Dutch retained their liberty and conquests. This termination of the struggle was owing chiefly to the diplomacy of Barneveldt, Maurice resisting it to the last. Bent on usurping supreme power, Maurice was ready to sacrifice the interests of his country in order to retain his command; and when checked by the energy of the veteran statesman, he eagerly sought for his destruction. Maurice flattered and excited the passions of the Gomarists, while Barneveldt adhered to the Arminians. The synod of Dort was convoked (1618), a mock trial was held, and Barneveldt perished on the scaffold (1619). Grotius and others were thrown into prison. A son of Barneveldt, who undertook to avenge his father, was executed. But the people punished Maurice by unconcealed detestation, and he entirely lost the fruit of his crimes. Only the renewal of the war after the expiration of the truce (1621) restored him to popularity. He compelled Spinola to raise the siege of Bergen-op-Zoom (1622), for the conquest of which he had sacrificed 10,000 of his best troops, but was unable to rescue Breda, his grief on the fall of which (1625) is believed to have caused his death. His elder brother having died, as restored prince of Orange, in 1618, the younger, Frederick Henry, succeeded as stadtholder. — See Motley, “History of the United Netherlands” (1860—67), and “Life and Death of John of Barneveldt” (1874).

Maurice, duke and elector of Saxy, a German general, born in Freiberg, March 21, 1521, died at Sievershausen, near Luneburg, July 11, 1588. He received a brilliant education, and joined the Protestant church in 1539. In 1541 he married a daughter of the landgrave Philip of Hesse, and in the same year (Aug. 18) succeeded his father Henry the Pious on the ducal throne. In 1542 he fought in the army of the emperor Charles V. against the Turks, and in 1543 against the French. He aided the emperor in defeating the Smalcauld league at the battle of Mühlberg (April 24, 1547), although his father-in-law was one of the two principal leaders of the league. The other leader was his cousin John Frederick of the Ernestine line of the house of Saxon, with whom he had previously quarrelled, and whose dominions were now added to his own. The crown of Bohemia was conferred upon him by the emperor (July 1, 1547). The landgrave of Hesse was at the same time treacherously arrested at Halte, and other arbitrary measures soon alienated Maurice from the emperor and caused him to originate a bold scheme, which with one stroke of his sword cut the knot that imperilled the reformation and the liberties of Germany. He availed himself in 1550 of the commission given him to enforce the imperial ban against the disaffected city of Magdeburg to make military preparations, and concluded a secret treaty with the king of France at Auch (April 24, 1551). Before throwing off his mask, he more demanded the liberation of his father-in-law, which was refused by Charles V. He now marched on Innspruck, where Charles was lying very sick with gout, and suddenly made his appearance before that city in May, 1552, while the French occupied the emperor’s possessions in Lorraine. Charles narrowly escaped capture by hasty flight, and was obliged to restore to liberty both the cousin and the father-in-law of Maurice, and to grant by the treaty of Passau (Aug. 2, 1552) the fullest religious liberty to the Protestants, upon which Maurice had insisted as a condition of peace. Subsequently he joined the emperor and his brother King Ferdinand in a new campaign against the Turks, and behaved with his wonted gallantry, but without achieving any decided success. Early in 1553 he joined the league against the margrave Albert of Brandenburg, who would not recognize the treaty of Passau. Maurice achieved a brilliant victory over him at Sievers-
hansen (July 9), but received a wound from which he died two days afterward. In 1853 a monument was erected on the battle field in his honor. He promoted important civil, military, and educational reforms in Saxony, and added several institutions to the university of Leipsic. He was succeeded by his brother Augustus. His only surviving daughter, Anna, became the wife of William L., prince of Oranoge.—See Moritz, Herzog und Kurfürst von Sachsen, by Langenn (2 vols., Leipsic, 1841).

MAURICE, John Frederick Denison, an English clergyman, born in 1805, died in London, April 1, 1872. He was the son of a Unitarian minister, and was sent at an early age to Trinity college, Cambridge, where he contracted a friendship with John Sterling, and they married sisters. He declined a fellowship on the ground that, being a Dissenter, he could not sign the thirty-nine articles of the church of England, and take a degree. Going with Sterling to London, he became connected with the "Athenaeum," and published a novel entitled "Eustace Conyers, or Brother and Sister." It was not put in circulation till 1834, when the publisher had quite lost sight of the author. The villain of the novel was called Capt. Marryat; and Mr. Maurice received a challenge from Capt. Frederick Marryat, whose astonishment was great on learning that the anonymous author of "Eustace Conyers" had never heard of the author of "Frank Mildmay," and, being in holy orders, was obliged to decline fighting a duel. At the end of two years he became a member of the church of England, and a candidate for holy orders, and about 1828 received ordination. Endeavoring to make the theology of his church minister to the social wants of the people, he pursued a career of activity and usefulness in that direction, although he encountered much opposition. Allying himself from the outset with that movement in the established church now known as the Broad Church party, of which Dr. Arnold of Hugger was the acknowledged pioneer, he was after the death of the latter commonly regarded as his successor in its leadership. His personal influence secured many adherents; and his numerous writings, nearly all of which were devoted to the exposition of "Broad Church" views, were widely circulated in Great Britain and America. Not less remarkable was his advocacy of "Christian socialism," in which he found an able and enthusiastic colleague in the Rev. Charles Kingsley. He founded a workingmen's college in London, to which he devoted much time and attention. In 1846 he was appointed chaplain and reader to Lincoln's Inn, and about the same time professor of theology in King's college, London, which latter post he resigned in 1853; and in 1860, by the queen, incumbent of the district church of Vere street, Marylebone. In 1866 he became professor of moral philosophy in the university of Cambridge, and in 1867 received the honorary degree of M. A. Charles Kingsley says that, although he was a great and rare thinker, he was greatest in his personal influence. His principal works are: "Theological Essays" (1853), which cost him his professorship in King's college; "Philosophy of the First Six Centuries," and "Unity of the New Testament" (1864); "The Patriarchs and Lawgivers of the Old Testament," and "The Prophets and Kings of the Old Testament" (1855); "The Epistles of St. John," and "Medieval Philosophy" (1867); "Parochial Sermons" (6 vols., 1860); "The Religions of the World," and "Lectures on the Apocalypse" (1861); "Modern Philosophy" (1862); "The Gospel of the Kingdom of Heaven" (1864); "The Gospel of St. John," and "The Conflict of Good and Evil in our Day" (1865); "The Workman and the Franchise," and "The Commandments, as Instruments of National Reformation" (1865); "The Conscience" (1868); and "Social Morality: Twenty Lectures delivered in the University of Cambridge" (1869). In connection with a layman he wrote "The Claims of the Bible and of Science" (1863). A posthumous work on the Lord's prayer, with a biographical sketch, was published in 1872, and "The Friendship of Books, and other Lectures," edited by Thomas Hughes, in 1874. A memorial of him has been printed, the proceeds to be devoted to placing his bust in Westminster abbey, to establishing the workingmen's college on a more permanent basis, and providing for lectures in it, chiefly on the history and study of the Bible.

MAURICE, Thomas, an English clergyman, born in Hertford about 1755, died in London, March 30, 1824. He graduated at Oxford, and became curate of Woodford in Essex. He resigned that post in 1785, and accepted a small pastorate at Epping. In 1799 he became assistant librarian to the British museum. His principal works are: "Indian Antiquities" (7 vols. 8vo, London, 1791-7); "History of Hindostan" (3 vols. 4to, 1796-9); "Modern History of India" (2 vols., 1802-4); and his personal "Memoirs" (3 vols., 1819-22).

MAURICE OF SAXONY. See Saxe.

MAURICIUS, Flavius Tiberius, a Byzantine emperor, born in Arabissus, Cappadocia, about 539, executed Nov. 27, 602. Descended from an ancient Roman family, he passed his youth in the camp and at the court of Justin II., and on the accession of Tiberius II. in 578 was appointed to conduct the war against the Persians. In 580 and 581 he totally overthrew the Persians in two pitched battles, and returned to Constantinople in triumph. On the death of Tiberius, who proposed Mauricius for his successor, the latter ascended the throne amid universal rejoicing (582). The Persians immediately renewed the war, and twice defeated the Byzantine commander-in-chief on their borders. Mauricius sent out his brother-in-law Philippicus, who gained a great victory at Solacola in 586, but soon after suffered
a total defeat in Arzanene. Philippicus was
deposed, but raised a mutiny, by which he
regained the command only to give new proof
of his incompetency; he was again deposed,
and Heraclius retrieved the fortunes of the
empire by repeated victories. The war which
succeeded between the Turks and Persians gave
relief to the Byzantine arms. The Persian
king Chosroes II., being driven into exile, took
refuge in the Byzantine territory, and wrote a
letter to Mauricius imploring aid. The em-
peror gave him a large sum of money, and sent
a powerful army for the invasion of Persia.
The Persian rebel Bahram was decisively de-
feated at Balarath, Chosroes was restored to
his throne (591), and from this time till the
death of Mauricius there was peace between
Persia and the empire. Hostilities, begun in 582,
had in the mean while been carried on
against the Avars. After one defeat the bar-
barians refrained from any incursion for five
years. When they again threatened the em-
pire, Mauricius intended to put himself at the
head of the army; but it was already the By-
zantine custom for the emperor not to com-
mand in the field, and yielding to the remon-
strances of the senate, he sent Priscus as a sub-
stitute. He was unsuccessful, and was super-
seded by the emperor's brother Peter, and the
latter soon after by Commentiolus, who suf-
f ered a disastrous defeat, in which 12,000 By-
zantines were made prisoners by the Avars,
and engaged in treacherious intrigues. The fortune
of the war was restored in five successive battles
by Priscus, who was again placed in command.
In 602 he was ordered by Mauricius to pass
to the northern side of the Danube into the
Avar territory. The emperor had allowed
the prisoners taken by the Avars to be put to
death rather than ransom them, the reason
probably being that they were the mutinous
and dangerous soldiers of Commentiolus. The
troops of Priscus now complained that they
were destined to destruction; of the 12,000
prisoners, organized a rebellion, made Phoenix
commander-in-chief, and marched toward Con-
stantinople; and while an insurrection arose
in the city, Mauricius escaped with his family
by sea, took refuge in the church of St. Au-
tonomus, near Chalcedon, and despatched his
son to Chosroes to ask him in turn for aid in
the recovery of his throne. The emissaries of
Phoenix, who had been proclaimed emperor,
found him in the sanctuary, and dragged him
to the scaffold. Five of his sons were
executed with him, his eldest son Theodosius
soon after, and the empress and three of her
daughters were imprisoned and afterward put
to death. He was distinguished for habits of
self-control, affection, and piety. He strictly
enforced beneficial laws, protected art and
learning, and wrote a treatise on the military
art, which still exists.

MAURITIANIA, or Mauretania, in ancient geog-
raphy, the N. W. coast of Africa, including the
modern Morocco and part of Algeria. It was
bounded N. by the Mediterranean, E. by the
river Ampsaga, which separated it from Nu-
midia, S. by the Atlas mountains, and W. by the
Atlantic. Numerous rivers intersect this
mountainous region and empty either into the
Atlantic or the Mediterranean; among them,
besides the Ampsaga, may be mentioned the
ancient Sala, Subur, Lix, Mulucha, and Chana-
laph. The Phænicians at a remote age founded
so many settlements here, that along the whole
coast there was not a single town whose popu-
lation was not of Canaanitish race. Herodo-
tus does not mention the nations of this region.
Later writers say that from the earliest times
it was inhabited by Maurusii or Mauri (Moors),
blacks, a tribe probably of the same race as the
Numidians, but their accounts of the origin or
immigration of these people seem to be fabulous.
The people have been ever at enmity with each
other, and have often been connected with the Libyans of
the Egyptian monu-
ments. (See Libyans.) They first became
known to the Romans when the latter in their con-
tests with the Carthaginians had carried the
war into Africa. In the Jugurthine war Boc-
chus, king of Mauritania, was conspicuous, and
his sons Bogudes and Bocchus were confirmed as
joint kings of the country by Julius Caesar
in 49 B.C. In A.D. 42 the Romans divided the
kingdom into two provinces separated from
each other by the river Malun or Mulucha;
the western province was called Mauritania Tingita,
and the eastern province Mauritia Cesari-
ensiensis. The Romans founded in these prov-
inces 21 considerable colonies, and introduced
into the population a large element of Italian
origin. In 429 the Vandals, led by Genseric,
conquered Mauritania; but in 534 it was recon-
cquered by Belisarius, and remained a province
of the empire till it was overrun and subdub
by the Mohammedan Arabs about the close
of the 7th century. (See Moors, and Monaco.)

MAURITIUS, or Isle of France, an island belong-
ing to England, in the Indian ocean, between lat.
19° 58' and 20° 31' S. and lon. 57° 21' and
57° 52' E. Its greatest west-east breadth is
120 m. E. of N. of Réunion, and 2,700 m.
the Cape of Good Hope; length N. and S. 39
m., greatest breadth 27 m.; area, 676 sq. m.;
pop. in 1872, 326,454. The island is divided
into nine districts. (See map.) Port Louis is
the capital and the port through which all
the foreign trade is carried on. The popula-
tion is made up of various Asiatic, African,
and European races, and of every conceivable
admixture of them all. Among them are sev-
eral thousand Hindoos, by whom the sugar es-
tates are mostly worked. The English ele-
ment is generally confined to the public func-
tionaries, and a few merchants, but has not
penetrated the mass of the population. Eng-
ish is little spoken. — There are numerous
capes and bays along the shore, and the island
is encircled by coral reefs at various distances,
but generally parallel to the land. In these
reefs there are 11 passes, through most of
which large vessels may enter and find good
ANCHORAGE WITHIN. THE RIVERS ARE OF LITTLE IMPORTANCE; IN THE RAINY SEASON THEY ARE SWOLLEN INTO TORRENTS, WHILE IN THE DRY THEY ARE LITTLE MORE THAN BROOKS. THERE ARE SEVERAL LAKES, WHICH ARE CALLED EITHER BASSINS OR MARÈS. THE LARGEST IS THE GRAND BASIN IN THE MOUNTAINS OF SAVANNE. THE MARE AUX VAKOIS, NAMED FROM THE VAKOI OR SCREW PINE (PANDANUS UTILIS), WHICH ABOUNDS IN THE DISTRICT, AND WITH WHICH IT IS ENCRUSTED, COVERS ABOUT TWO SQUARE MILES IN RAINY WEATHER. MANY STREAMS FLOW INTO IT; IT IS IN SOME PLACES 25 FATHOMS DEEP, AND IS WELL STOCKED WITH CRAWFISH, PRAWNS, EELS OF ENORMOUS SIZE, AND A SMALL RED FISH ORIGINALLY BROUGHT FROM CHINA. MAURITIUS IS EXCEEDingly Picturesque, Having Lofly Ranges of Hills, with Bold and Grand Outlines. IT IS INTERSECTED BY THREE PRINCIPAL CHAINS OF MOUNTAINS, WITH SPURS RADIATING TO THE COAST, WHICH VARY FROM 1,800 TO 2,800 FT. ABOVE THE SEA, AND MANY OF THEM ARE OF VERY SINGULAR FORM. THE MOST REMARKABLE IS PIETER BOOTH OR PETERBOTE, 2,874 FT. HIGH, TERMINATED BY A SPIRE OF NAKED ROCK, ON THE TOP OF WHICH RESTS AN ENORMOUS MASS OF STONE, LARGER THAN THE POINT ON WHICH IT IS BALANCED. THE HIGHEST PEAK IS THE PITON OF THE RIVIÈRE NOIRE, WHICH IS 2,902 FT. ABOVE THE SEA. ANOTHER, CALLED LE POUCE, FROM ITS RESSEMBLANCE TO THE HUMAN THUMB, IS 2,707 FT. HIGH. THERE ARE MANY CURIOUS Caverns, OF CONSIDERABLE EXTENT, IN SOME OF THE RANGES. IN THE CENTRE OF THE ISLAND, ON AN ELEVATED PLATEAU, THERE IS A MOUNTAIN OF A SUGAR-LOAF FORM CALLED PITON DU MILLE DE LIE. THE LAND RISES GRADUALLY FROM THE SHORE TO THE INTERIOR, AND THE N. END IS MORE ELEVATED THAN THE S. THE ISLAND PRESENTS NUMEROUS INDICATIONS OF VULCANIC ORIGIN. THE ROCKS RISE IN STRATA FROM THE SHORE TO THE CENTRE OF THE ISLAND, UPON WHICH THERE ARE MANY MOUNTAINS COMPOSED OF FERRUGINOUS ROCKS AND GRAYISH LAVA. IRON ORE IS VERY ABUNDANT, BUT THE IRON IS OF INFERIOR QUALITY. THE HEAT, WHICH IS GREATEST FROM NOVEMBER TO APRIL, IS TEMPERED ON THE COASkS BY SEA BREEZES, AND IN THE INTERIOR BY THE ELEVATION OF THE SURFACE; AND THE CLIMATE IS SO SALUBRIOUS, THAT EUROPEANS WHOSE HEALTH IS IMPAIRED IN INDIA COME HERE TO RESTORE IT. THE MEAN ANNUAL TEMPERATURE AT PORT LOUIS IS ABOUT 74° F., AND SOMewhat LESS ON THE OPPOSITE SIDE OF THE ISLAND. THE AVERAGE ANNUAL FALL OF RAIN AT PORT LOUIS IS 39-25 INCHES. THE RAINY SEASON IS FROM JANUARY TO APRIL, BUT SHOWERS ARE FREQUENT AT ALL TIMES, PARTICULARLY IN THE INTERIOR. BETWEEN DECEMBER AND MAY THE ISLAND IS SUBJECT TO HURRICANES, FOR WHICH ITS NEIGHBORHOOD IS FAMOUS. IN 1773 THE CHURCH AND ABOUT 300 HOUSES WERE DESTROYED AT PORT LOUIS BY A HURRICANE; AND ON THE OPPOSITE SIDE OF THE ISLAND THE SEA ROSE 45 FT. IN MARCH, 1818, AND FEBRUARY, 1824, GREAT HURRICANES DID IMMENSE DAMAGE TO THE PLANTATIONS AND SHIPPING, AND CAUSED THE LOSS OF MANY LIVES. DURING A TERRIBLE CYCLONE ON MARCH 10-12, 1868, NEARLY 3,000 VALUABLE BUILDINGS WERE DESTROYED, INCLUDING 600 OF STONE AND IRON, AND MORE THAN 20,000 HUTS OF THE LABORING POPULATION; THE NUMBER OF PERSONS KILLED WAS 89; AND A VAST AMOUNT OF PROPERTY OF ALL KINDS WAS DESTROYED. THE MORTALITY AMONG THE TROOPS IS VERY LITTLE GREATER THAN IN EUROPE, AND DOES NOT MUCH EXCEED 3 PER CENT. PER ANNUM. BUT OF LATE YEARS MALIGNANT FEVERS HAVE PREVAILED, AND IN 1872 HAD BECOME ENDEMIC AND WERE LIKELY TO OCCUR WITH MORE OR LESS SEVERITY IN EVERY HOT SEASON. IN 1867 THE NUMBER OF DEATHS IN THE ISLAND WAS 40,114, OR 12 PER CENT. OF THE POPULATION; BUT NO SUCH TERRIBLE MORTALITY HAS OCCURRED IN ANY OTHER YEAR. THE NUMBER OF DEATHS IN 1868 WAS 18,403, AND IT CONTINUED TO DECREASE TILL 1871, IN WHICH YEAR AND 1872 THERE WAS AGAIN A SLIGHT INCREASE. IN 1871 THE MORTALITY FROM FEVER WAS NEARLY 45 PER CENT. OF THAT FROM ALL CAUSES; AND IN 1872 IT WAS 48 PER CENT.—THE CHIEF PRODUCTION IS SUGAR; COFFEE IS GROWN, AND RICE IN SMALL QUANTITIES; BUT THE PRODUCTION OF ALL ARTICLES OF FOOD IS FAR INFERIOR TO THE CONSUMPTION. THE VEGETATION IN GENERAL RESEMBLES THAT OF THE CAPE OF GOOD HOPE. INDIGO, COTTON, AND SPICES HAVE BEEN SUCCESSFULLY CULTIVATED. THE NATIVE TIMBER IS OF EXCELLENT QUALITY AND CONSIDERABLE VARIETY, INCLUDING EBONY (THE FINEST IN THE WORLD), OAK, IRONWOOD, AND A KIND OF PINE. THE VACONA OR SCREW PINE (PANDANUS UTILIS) IS NOT ONLY A VERY COMMON WILD PLANT, BUT IS LARGELY CULTIVATED FOR THE SAKE OF ITS LEAVES, EXTENSIVELY USED IN THE MANUFACTURE OF THE SACKS IN WHICH THE SUGAR IS EXPORTED. NEARLY EVERY BEAUTIFUL TREE OF THE TROPICS BLOOMS HERE. THE INDIGENOUS FRUITS ARE OF LITTLE VALUE, AND ARE CHIEFLY THOSE OF THE EBONY AND PALMISte; BUT GUAVAS, 13 KINDS OF BANANAS, PEACHES, PINEAPPLES, MULBERRIES, AND STRAWBERRIES ARE RAISED ON MOST OF THE PLANTATIONS. THE GOVERNMENT BOTANIC GARDENS AT PAMPLEMOURSES, ESTABLISHED BY M. POIVRE, THE GOVER-
nor in 1768, are remarkable for their varied productions, and contain the richest and rarest plants of the East. With a view to improving the culture of the cane, an agricultural society was formed in 1853 by the principal planters. The surface of the ground being to a great extent covered with stones, renders the use of the plough impracticable, and cultivation is chiefly carried on by the hoe. Guano is extensively used as a manure. Its power in increasing the product of the cane is at first almost incredible, but in a few years it exhausts the land. Deer and wild hogs and goats are abundant in the plains, and short-legged hares are numerous in the mountains. Apes are to be found in the forests, and are frequently used as food by the negroes. The tenrec, a species of hedgehog, is common, and with the montouck, an insect which eats into the heart of trees, is delicate food in the dry season for the wood cutters of the Plaines Wilhema. There are great numbers of rats, which are exceedingly destructive, and mice are common. The birds of the island are not numerous, and are mostly of the smaller tribes, with partridges, wood pigeons, and doves, and in the marshy spots a kind of water hen. The only bird of prey is a species of hawk. Mauritius was once the home of the dodo and of a number of other birds of species now supposed to be extinct. Among these were the "giant" (Leguatio gigantea), a kind of water hen, 6 ft. high, and a red bird of the rail family, with a bill like a snipe (gahanepteryx imperialis). The martin, introduced from Asia, has checked the increase of insects. There is, however, a considerable variety of beautiful insects on the island, among which are butterflies, moths, great numbers of grasshoppers, wasps, and wild bees. A most destructive insect, called the kakerlac (blatta americana ferruginea), is one of the greatest pests of the island, attacking every kind of substance, leather, binding of books, and provisions. Ants infest every place, and one kind occasions great damage to trees and woof work. There are no serpents, nor any venomous insects, except small species of scorpion and centipede. The fish on the coast are abundant and excellent; and there is a great variety of crabs and molusks. The lobster attains a prodigious size. The sea slug so highly esteemed in China is found within the reefs. Horses, mules, donkeys, horned cattle, sheep, and hogs are imported. In 1870 there were on the island 18,394 horned cattle and 18,059 sheep. — Sugar was exported in 1868 to the amount of 296,512,677 lbs., the largest quantity ever exported in any one year; in 1868, 291,760,000 lbs.; in 1869, 239,680,000 lbs.; in 1870, 228,480,000 lbs.; in 1871, 275,520,000 lbs.; and in 1872, 284,480,000 lbs. The average price per pound since 1867 has been 2½d. The total value of the exports to Great Britain for the five years 1868-72 was as follows: 1868, £1,055,419; 1869, £677,515; 1870, £571,387; 1871, £933,386; 1872, £1,539,565. The total value of the exports to all countries in 1871 was, by official returns, £3,063,954, or including specie £3,120,528; and in 1872, £3,177,501, or including specie £3,243,112: "but the true exports," says the government administrator, "undoubtedly far exceeded the amount declared." The value of the imports from Great Britain in the same period was as follows: 1868, £404,425; 1869, £399,879; 1870, £499,975; 1871, £538,909; 1872, £5,911,712. The total value of the imports from all countries in 1871 was £1,507,382, or including specie £2,044,386; and in 1872, £2,437,512, or including specie £2,677,974. The only home product of note-worthy amount exported, besides sugar, is rum. Mauritius is mostly dependent upon imported provisions and manufactures. In 1870, 574 ships arrived, of which 322 were British, 95 French, and 8 from the United States. In 1873 the total tonnage of vessels entered and cleared was 548,452. The main roads of the island are good, being mostly macadamized and kept in order by the government. There are two lines of railway: the North line, from Port Louis to Grande Riviere S. E., and the Midland, from Port Louis to Mahébourg, each of which has short branch lines. The scenery upon the latter line is very fine. Telegraphs are established along the lines. — There are at Port Louis a convent with a large boarding school attached for young ladies, and a convent with a hospital attached under the charge of the sisters of charity. There is also a royal college, in connection with which a new elementary school was opened in 1872: a branch school at Curepipe, and numerous other public schools, are in a very flourishing condition. The total number of pupils on the rolls of the government schools in 1872 was 5,040; and the annual grant for schools voted by the legislature is about £5,000. The Roman Catholic is the prevailing religion, presided over by a bishop. There are 17 Catholic churches and 32 chapels. The church of England is represented by a bishop with the title "Lord Bishop of Mauritius and its Dependencies." Both Protestant and Catholic clergy are paid out of the colonial treasury. Mohammedanism is professed by some of the inhabitants, and a mosque is in course of building. Several newspapers are published at Port Louis, only one of which is in the English language. — The government of the island is vested in a governor aided by an executive council, and a legislative council consisting of seven official members and ten nonofficial members chosen from the chief landed proprietors of the island, and confirmed in their appointment by the crown. There is a supreme court of civil and criminal justice, presided over by three judges; and a petty court for the trial of trivial crimes and offences. The revenue of the island, chiefly derived from customs and licenses, was for 1871 and 1872 £468,851 and £528,689; and the expenditure, £445,111 and £464,149 respectively. The gross
The principal island, Mauritius, was discovered in 1598 by Pedro Mascarenhas, who called it Cerné. The Portuguese held it until 1598, when a Dutch squadron took possession of it, the commander changing the name to Mauritius, in honor of Maurice of Nassau. The Dutch first settled here in 1644, but they abandoned it in 1712 for the Cape of Good Hope; and it was taken in 1715 by the French, who called it Île de France. The first regular settlement took place in 1721; and under Mahé de Labourdonnaux, who introduced the cultivation of the sugar cane, indigo, and manioc, and was appointed governor in 1734, the colony became very prosperous. It was during his second administration that the ship St. Geran was wrecked, in which was lost the young lady whose story was the basis of Bernardin de Saint-Pierre's tale of "Paul and Virginia." During the wars of the revolution and empire, the French island owed most of its wealth to corsairs, the terror of British merchant vessels in the Indian seas. The British seized the island with its dependencies in 1810, and by the peace treaties of 1814 and 1815 the English possession of the island was ratified. In 1853 slavery ceased to exist in Mauritius. The island was made a bishopric in December, 1854. —See Pike's "Subtropical Rambles in the Land of the Aphanan-teryx" (New York).
of the church, aristocracy, and royalty, and was the most daring and powerful antagonist of Mirabeau. Until the flight of Louis XVI, he opposed, on the revolutionary measures with pre-
eminent skill and at constant peril. At the close of the constituent assembly he left France, and 
was received with a triumph at Rome, where he 
took up his residence. He was made succes-
ively archbishop of Nizza in partibus, nuncio 
to the diet at Frankfort for the election of em-
peror, cardinal, and bishop of Montefiascone and Corneto. On the invasion by the French in 
1798 he escaped in disguise to Venice, and 
passed thence to St. Petersburg. Returning in 
1799, he was appointed by the count of Pro-
vençe (afterward Louis XVIII,) his ambassador 
to the holy see, but became reconciled to Na-
poleon, and returned to France in 1806. He 
was declared a French cardinal, was consulted in ecclesiastical affairs, and elected a member of 
the institute, but lost the esteem of his former 
friends. In 1810 he was appointed archbishop of Paris, and his florid episcopal charges were 
subjects of ridicule, and showed no signs of his 
former energy. When the pope was taken to 
Savona as a captive of Napoleon, he ordered 
Cardinal Maury to relinquish the administra-
tion of his diocece. He disobeyed, and after 
the restoration was imprisoned at Rome. His 
*Essai sur l'éloquence de la chaire* (2 vols., 1810) 
is still esteemed.—See Poujoulat, *Le cardinal 

**MAURY, Louis Ferdinand Alfred,** a French au-
thor, born in Meaux, March 23, 1817. In 1836 
he became attached to the royal library, which 
he quitted in 1838. His bibliographical knowl-
edge caused him to be recalled in 1840, and in 
1844 he was elected sub-librarian to the insti-
tute. In this office he rendered important ser-

cies, and in 1857 he was elected a member of 
the academy of inscriptions and belles-lettres. 
In 1860 he was appointed librarian of the Tu-

eries, in 1862 professor of history and moral 
philosophy in the collège de France, and in 
1868 director general of the archives. His 
principal publications are: *Essai sur les 
légendes pieuses du moyen âge* (Paris, 1843); *Les 
feux du moyen âge* (1855); *Histoire des grandes 
forêts de la France* (1860); *La terre et l'homme* 
(1850), a summary of recent geographical, eth-

tological, and philological researches; *Histoire 
des religions de la Grèce antique* (3 vols., 
1857-'60); and *Musée d'archives*, an account of 
a collection from the Merovingian period 
until the first French revolution, with 1,200 fac-
simile autographs by Charles Bethmont.

**MAURY, Matthew Fontaine,** an American hy-
drographer, born in Spotsylvania co., Va., 
Jan. 14, 1806, died in Lexington, Va., Feb. 1, 
1873. His parents removed while he was still 
young to Tennessee. In 1825 he entered the 
naval service as midshipman, and was appointed 
to the Brandywine, then fitting out to convoy 
Lafayette to France. He returned with this 
vessel in 1829, and made a voyage in her to the 
Pacific, where he was transferred to the sloop 
of war Vincennes, in which he circumnavigated 
the globe. During this cruise, and while yet 
a passed midshipman, he began his "Treatise 
on Navigation," which passed through several 
editions, and was used as a text book in the 
navy. In 1836 he was promoted to a lieuten-
ancy, and received the appointment of astrono-
er to the South sea exploring expedition, but 
resigned it. In 1839 he met with an accident 
which resulted in permanent lameness and un-
fitted him for service afloat. He was now 
placed in charge of the depot of charts and in-
struments at Washington, afterward known as 
the hydrographical office; and upon the organ-
ization and union with it of the national ob-
servatory in 1844, he was made superintendent 
of the combined institutions. Before this he 
had begun a series of investigations in what 
Humboldt has called the "physical geography 
of the sea," and had gathered many observa-
tions of the ocean winds and currents from the 
records of naval and merchant vessels. In 
some cases special cruises were made to supply 
data, until material was collected for a system-
atic study of the actual course of winds and 
currents. In 1844 he made known his conclu-
sions respecting the Gulf stream, ocean cur-
rents, and great-echo sailing. He warned 
before the national institute, and printed under 
the title of "A Scheme for Rebuilding Southern 
Commerce." With the accumulation of mate-
rial the need was felt of systematizing the observa-
tions and records themselves, particularly as 
ships of different nations used different methods 
of observation and registry. Lieut. Maury ac-
cordingly entered into a project for assembling 
a general maritime conference, which at the 
suggestion of the United States government 
met in Brussels in 1853, and recommended a 
form of abstract log to be kept on board ships 
of war and merchant vessels, and a principle 
and results of Maury's researches are embodied in the "Physical Geography of the Sea" (New 
York, 1856, several times revised and greatly 
 enlarged; last ed., "Physical Geography of the 
Sea and its Meteorology," 1873). In 1855 Lieut. 
Maury was promoted to the rank of commander. 
On the outbreak of the civil war he resigned 
and was made a commodore in the confederate 
navy, and subsequently professor of physics in 
the Virginia military institute. He was a mem-
ber of many of the principal scientific associa-
tions of America and Europe, and received 
valuable testimonials from several foreign gov-
ernments. Besides the works already men-
tioned, he published "Letters on the Amazon 
and the Atlantic Slopes of South America;" "Rela-
tion between Magnetism and the Circula-
tion of the Atmosphere," in the appendix to 
"Washington Astronomical Observations for 
1846" (1851); "Astronomical Observations" 
(1853); "Letters concerning Lanes for the 
Steamers crossing the Atlantic" (1854); "Man-
ual of Geography: a Complete Treatise on 
Mathematical, Civil, and Physical Geography" 
(1871); and smaller works on geography.
MAUSOLEUM. See HALICARNASSUS.

MAUVÉ (Fr., purple mallow), a dyeing material obtained by the extraction of aniline, a product of coal tar. It was first extracted by Mr. Perkin of England, who gave it this name. It is prepared by dissolving equivalent proportions of sulphate of aniline and bichromate of potash in water, mixing, and allowing them to stand some hours. A black precipitate, obtained on filtering, is washed, dried, and digested in coal-tar naphtha to extract a brown resinous substance. The coloring matter is then extracted by digestion in alcohol, and is obtained on distilling off the spirit in a coppery friable mass; or it may be kept liquid in alcohol. The color it gives are a variety of shades of purple, the blue predominating in some, and red in others. (See ANILINE, AND DYEING.)

MAVERICK, a S. W. county of Texas, separated from Mexico by the Rio Grande, and intersected by San Ambrosio river; area, 900 sq. m. ; pop. in 1870, 1,931, of whom 281 were colored. Only a small portion of the land is fit for cultivation. The chief productions in 1870 were 8,315 bushels of Indian corn and 24,060 lbs. of wool. There were 294 horses, 797 milch cows, 28,863 other cattle, and 17,682 sheep. Capital, Eagle Pass.

MAVROCORDATOS, Alexander, a Greek statesman, born in Constantinople in February, 1791, died in Egina, Aug. 18, 1865. He made himself an accomplished linguist, and in 1817 was secretary of his uncle Caradja, hospodar of Wallachia. Subsequently he resided for some time in Switzerland and Italy. In 1821, on the outbreak of the Greek revolution, he sailed with a number of French and Italian volunteers to the Peloponnese, and was sent to organize the insurrection in Etolia and Acarnania. At the close of the year he was elected president of the national assembly at Epidaurus, which framed the provisional constitution and proclaimed the declaration of independence (January, 1822). He was made soon after proedros or president of the executive committee. In the following years, as commander-in-chief, he distinguished himself in the defence of Missolonghi, Navarino, and Spacheria. A supporter of liberal tendencies, he violently opposed the Russian leanings of both John and Augustine Capo d'Istria. In 1833-34 he was in the cabinet of King Otho, and afterward was ambassador at Munich, Berlin, and London, whence he was recalled in July, 1841, to take the presidency of the ministry. In 1843 he was a special ambassador to the Porte, and for a short time in 1844 was again at the head of the ministry. In 1850-54 he was ambassador at Paris, and on his return was once more placed at the head of the cabinet, from which in 1856 he resigned and retired to private life.

MAXIMIAN, Maximilian, an American clergyman, born in Attleborough, Mass., Sept. 2, 1768, died in Columbia, S. C., June 4, 1829. He graduated at Brown university in 1787, and in September, 1791, was instituted pastor of the first Baptist church of Providence, and at the same time elected professor of divinity in Brown university. In the succeeding September, although but 24 years of age, he became its president. In 1802 he was elected president of Union college, N. Y., and in 1804 of the South Carolina college. This latter station he occupied until his death. His "Literary Remains, with a Memoir," was published by the Rev. Romeo Elton (New York, 1844).

MAXENTIUS. See CONSTANTINE I, the Great.

MAXIMIANUS I. See Diocletian.

MAXIMIANUS II. See Galerius.

MAXIMILIAN I, emperor of Germany, born in Neustadt, near Vienna, March 22, 1459, died at Wels, Jan. 12, 1519. He was the son of the emperor Frederick III., of the house of Hapsburg, and of Eleanor, a princess of Portugal. He learned to speak several languages, acquired various branches of knowledge, and, spending his youth in the wars of his father with Podiebrad of Bohemia, Matthias Corvinus of Hungary, and others, became an excellent horseman, tilter, and hunter, gallant, chivalrous, and adventurous. His father, faithful to the maxim of his house to conquer by marriages, sought for him the hand of Mary, daughter and heiress apparent of Charles the Bold of Burgundy, promising a royal crown to the duke. The parties and their parents met at Treves in 1478; but the mutual distrust of the latter broke off the negotiations. After the death of Charles (1477) his widow Margaret rejected the offers of Louis XI. of France in behalf of his infant son Charles (afterward VIII.), and soon afterward the rich and beautiful heiress became the wife of Maximilian, and in a few years the mother of two children, Philip and Margaret. But her husband neither saved all her possessions from the rapacity of Louis XI., nor obtained the ready allegiance of the rich cities of the Netherlands, when on her sudden death by a fall from her horse in 1482, he claimed the regency for his son Philip. Louis was active in instigating and promoting revolts in those provinces, and Maximilian suffered still greater injury from France when, after his election and coronation as king of the Romans (1486), having married by proxy another rich heiress, Anne of Brittany, and promised his own daughter Margaret to Charles VIII., Anne de Benieu, the regent for the latter, suddenly broke off both engagements, bringing Brittany with Anne into the hands of Charles, and sending back Margaret to her father. The war which ensued was of short duration. Maximilian now married Bianca Sforza, daughter of the murdered duke of Milan, Galeazzo Maria, receiving 500,000 ducats from her uncle and guardian, the bloody Ludovico Moro, on whom he bestowed Milan, the heritage of the brother of his bride. The wife of the lawful heir, however, a Neapolitan princess, sought for aid from her native coun-
try, and the usurper Moro thereupon prevailed on the king of France to renew the old claims of the house of Anjou to Naples, and to order an Italian campaign. This led to those long Italian wars, in which during Maximilian's lifetime Charles VIII., Louis XII., and Francis I. of France, Ferdinand the Catholic of Spain, the popes Alexander VI. and Julius II., the empire, Switzerland, the republic of Venice, and Naples were principally engaged. Campaigns, treaties of peace, alliances, and treacherous deserts of allies followed in rapid succession; but the details belong to the history of the more important actors. Maximilian, who in 1493 had succeeded his father as emperor, played in the whole a secondary part, so far inadequate to his schemes were the supplies which he was able to extort from the unwilling states. One of these plans was that of becoming pope after the death of Julius II. Instead of aiding their emperor, the states of Germany were always ready to complain, and the empire itself was not a little distracted by feuds, in spite of the eternal peace decreed by the diet of Worms in 1495, of the new Reichskammergericht, and the exertions of the Swabian league for the maintenance of order. Switzerland, which was to be reconquered, now entirely detached itself from the German body, whose head saw himself often deserted by his allies, sometimes by his own troops, and frequently penniless. The troubles of the reformation broke out shortly before his death. In the mean time he had not neglected to continue the safer and peaceful conquests of his house. Philip and Margaret, his only two children by Mary of Burgundy, married Juana and Juan, the children of Ferdinand of Aragon and Isabella of Castile; Philip succeeded to the throne of Castile in 1504, and died in 1506; and his son Charles, on the death of Ferdinand in 1516, inherited the whole of the empire of his father. This young prince also became the successor of Maximilian as emperor of Germany, under the name of Charles V., his younger brother Ferdinand receiving the German possessions of Austria, and subsequently, in consequence of other marriage connections, also ascending the thrones of Hungary and Bohemia. Having also succeeded Charles V. in the empire, Ferdinand I. left all his thrones to his good-natured but feeble son Maximilian II. (1544-76). Maximilian I. left several treatises on military science, gardening, the chase, and other subjects, and a poetical work on his own life.

MAXIMILIAN (FERDINAND MAXIMILIAN JOSPEHU), archduke of Austria and emperor of Mexico, born in Vienna, July 6, 1832, shot in Querétaro, Mexico, June 19, 1867. He was the second son of the archduke Francis Charles and of the archduchess Sophia, and a brother of the present emperor Francis Joseph. He entered the naval service, and in 1854 became rear admiral and chief of the navy, and in 1857 governor of the Lombardo-Venetian kingdom. In the same year he married in Brussels (July 27) the princess Charlotte, daughter of Leopold I. and sister of the present king of the Belgians. On the outbreak of the war of 1859 he retired to Venice, and subsequently to his beautiful château of Miramar near Trieste. Here, with the exception of a voyage of scientific exploration to Brazil, he resided until his departure, April 14, 1864, for Mexico, having accepted, at the instance of Napoleon III., the crown of Mexico, under the name of Maximilian I., with the consent of the emperor of Austria and of that portion of the people of Mexico whose sanction could be secured through French influence. He had waived his claim of succession to the throne of Austria in the event of his brother's death, and made farewell visits at the French, Belgian, and English courts; and in Rome he received the pope's blessing. He landed with his wife at Vera Cruz, May 28, 1864. An auxiliary corps was organized in Austria and Belgium, and a loan was raised in France for the benefit of the new Mexican empire, which was intended by Napoleon to consolidate the power of the Latin race in the new world. One of the first measures of Maximilian, who was childless, was to adopt a son of the emperor Turibide as his presumptive successor on the throne. He established committees for the regulation of public affairs, promulgated an amnesty, and manifested excellent intentions for the faithful administration of the government; but he soon lost the support of the clergy, who were grievously disappointed by his failure to restore their sequestered estates, and who had been almost his only zealous partisans. Almost from the beginning he found himself confronted by formidable difficulties, which increased in proportion to the determined resistance of President Juarez and of the masses of Mexicans to the French invasion and to his usurpation of the crown. The whole course of the American invasion and the dissatisfaction of the United States with European encroachments upon the American continent. In 1865, after the close of the civil war in the United States, the attitude of the latter government became more determined; and public opinion in France, and the increasing complications of Napoleon at home and abroad, admonished the latter to abandon the scheme. The emperor Charlotte in vain attempted in 1866, in interviews with Napoleon in Paris and with the pope in Rome, to change the current of events. While in Rome her mind gave way under the pressure of anxiety, and she has ever since lingered at the château of Laken hopelessly insane. Napoleon, having formally undertaken to withdraw his troops, despatched Gen. Castelnau to the city of Mexico to reconcile Maximilian to the necessity of abdicating; but the latter would not entertain such an idea, and went to Orizaba to avoid meeting the French envoy. Here in November he assembled his ministers, who were nearly all opposed to his abdication, and on Dec. 5 he called a national congress,
by whose decision he promised to abide. But no such assembly could be brought together, owing to the opposition of the greatest majority of republicans; and the meeting of Jan. 14, 1867, consisted of only 35 notables, all but 10 of whom were opposed to the abdication. But no practical result could have been achieved under any circumstances, as the authority of Juarez was fully restored excepting in the cities of Mexico, Puebla, Vera Cruz, and Querétaro. Besides, Maximilian's exchequer was empty, and the withdrawal of the French under Bazaine included even those who had enlisted in his army. Yet, instead of remaining in the capital, to which he had returned, and where there were more adequate means of resistance than anywhere else, he decided on removing to Querétaro with a single corps (Feb. 18), and offering battle to his adversaries, who speedily besieged that place. He made several gallant but-unavailing sorties, and he and his soldiers were reduced to the last extremities by the exhaustion of provisions, when he decided to escape through the enemy's line (May 15). But Gen. Escobedo, having gained access to the city in the preceding night through the treachery of Col. Lopez, arrested Maximilian and Gens. Miramon and Mejia. After a fruitless effort to procure the intervention of the United States in his behalf, he was sentenced to death by court martial, June 18, and shot six days afterward, together with the two generals. The emperor of Austria sent Vice Admiral Tegelthoff to Mexico to convey his remains to Vienna, where they were interred in the imperial vault, Jan. 18, 1868.—His writings have been published under the title Aus meinem Leben, Reisezüge, Aphorismen, &c. (7 vols., Leipzig, 1867). See also Eugène de Kératry, L'Empereur Maximilien, son élevation et sa chute (Paris, 1867); Hellwald, Maximilian I., Kaiser von Mexico, nebst Abriss der Geschichte des Kaiserreichs (Vienna, 1869); and Kendall, "Mexico under Maximilian" (London, 1872).

MAXIMILIAN JOSEPH, "duke in Bavaria," a German author, born in Bamberg, Dec. 4, 1808. He is the only son of Pius Augustus, duke in Bavaria, married in 1828 the princess Louisa, a daughter of King Maximilian I., and was appointed to a high rank in the army. He described his journey to the East in his Wanderung nach dem Orient (Munich, 1889). His other works, published under the nom de plume of Phantasus, include Noellen (2 vols., 1831); Skizzenbuch (1834); the novels Jakobina (1835) and Der Stiefbruder (1838); and Sammlung oberbayerischer Volkslieder und Singweisen (1846). He has three sons and five daughters, one of whom, Elizabeth, became in 1854 the wife of the emperor Francis Joseph of Austria.

MAXIMIN (CAESAR JULIUS VERUS MAXIMINUS), a Roman emperor, born in Thrace in the latter part of the 2d century, killed before Aquileia in 238. He was the son of a Goth by an Alan woman, and was brought up as a shepherd. During the passage of the emperor Septimius Severus through Thrace, on his return from the East, he attracted the attention of that monarch by marvellous feats of strength and agility, as well as by his gigantic stature, being more than 8 ft. high, and eventually able to wear the bracelet of his wife as a ring on his finger. Admitted to the army, though a barbarian, he rose from rank to rank, gained the admiration of his fellow soldiers by valor equalling his strength, and after several reigns succeeded in supplanting the virtuous Alexander Severus, on whose assassination by the soldiers in Gaul he was proclaimed emperor (235). He appointed his son Maximus to the dignity of Caesar. Though successful in his almost continual wars against the Germans, the imperial barbarian, who is said to have eaten 40 pounds of meat and drunk an amphora of wine a day, was tormented by a sense of insecurity, and in order to preserve his power perpetrated cruelties which surpassed those of his previous masters, Caracalla and Elagabalus. He spared none whom birth or merit exposed to suspicion. For alleged conspiracy, Magnus, a senator, was put to death, with 4,000 other persons. Simple death was regarded as a favor. His rapacity was no less disastrous than his cruelty, and he finally sunk under the general indignation of the provinces aroused by a wholesale confiscation of municipal property for the use of the imperial treasury. The insurrection broke out in Africa, where the two Gordians were proclaimed emperors. These perishing soon after, the senate proclaimed Maximus and Balbinus their successors. Maximin, who had his winter quarters on the lower Danube, hastened to Italy, crossed the Alps, and besieged Aquileia, but was soon murdered, together with his son, by his own soldiers.

MAXWELL, James Clerk, an English physicist, born in Edinburgh in 1831. He was educated at the academy and university of Edinburgh and Trinity college, Cambridge, graduating at the last institution in 1854. In 1856 he was appointed professor of natural philosophy in Marischal college, Aberdeen, and in 1860 in King's college, London, where he remained till 1865. In 1871 he became professor of experimental physics in the university of Cambridge. He has published "Essay on the Stability of the Motion of Saturn's Rings" (London, 1859), "Theory of Heat" (12mo, 1871), and "Treatise on Electricity and Magnetism" (2 vols. 8vo, 1873). The last named work possesses much interest beyond its mere value as a scientific treatise, being a translation into mathematical form of Faraday's "Experimental Researches in Electricity." Mr. Maxwell with many others regards Faraday's as a profound mathematical mind, although not familiar with technical mathematical language, and believes that many methods of research employed by mathematicians could better be expressed "in terms of ideas derived from Faraday than in their original form."
MAY (Lat. Maius), the fifth month in the Gregorian calendar, consisting of 31 days. Among the Romans it was sacred to Apollo, and almost every day was a festival. On the 9th, 11th, and 13th days was celebrated the festival of the Iemurjia in memory of the dead, and consequently it was believed that marriages contracted in this month would result fatally. There is also a French proverb: *Noces de Mai, noces de mort.* From the ancient *Floralia,* or festival in honor of Flora, celebrated from April 28 to May 2, is perhaps derived the mediaval and modern custom of observing May 1 (Mayday) with festive and floral rites. The druids also were accustomed to light large fires upon the summits of hills on the eve of May. Polydore Vergil says it was usual to adorn not only houses and gates, but also churches, with boughs and flowers. Hall mentions in his *"Chronicle"* that Henry VIII, rode a-Maying with Queen Catharine and many lords and ladies from Greenwich to the high ground of Shooter’s hill.

MAY, Caroline, an American authoress, born in England. She is the daughter of the Rev. Edward Harrison May, for many years pastor of one of the Dutch Reformed churches of New York. She has edited “American Female Poets” (1848), with numerous biographical and critical notes; “Treasured Thoughts from Favorite Authors” (1850, 51); “The Woodbine” (1852), an annual; and has published “Poems” (1864), and “Hymns on the Collects” (1872). Miss May is also a painter and musician. She resides at Pelham, Westchester co., N. Y., on the grounds of Miss Bolton’s “Priory” — her brother, Edward H. May, is a painter of some celebrity in Paris.

MAY, Samuel Joseph, an American clergyman, born in Boston, Sept. 12, 1797, died in Syracuse, N. Y., July 1, 1871. He graduated at Harvard college in 1817, studied divinity at Cambridge, and in 1822 settled as a Unitarian minister at Brooklyn, Conn. He was a member of the convention which organized the national anti-slavery society in 1833, and signed the “Declaration of Sentiments.” In 1835 he became general agent of the Massachusetts anti-slavery society, in which capacity he travelled and lectured extensively. In 1836 he became pastor of the Unitarian society in South Seicuale, Mass., and from 1842 to 1844 was principal of the girls’ normal school at Lexington, Mass. In 1845 he accepted the pastorate of the Unitarian society in Syracuse, N. Y., which he retained until three years before his death. He was always active in the cause of popular education, as well as in the promotion of charity. For his advocacy of emancipation his life was frequently in danger, and in January, 1861, he was mobbed and burned in effigy in Syracuse for attempting to hold an abolition convention. He published “Recollections of the Anti-Slavery Conflict” (Boston, 1868), and several addresses and essays.—See “Memoir of Samuel Joseph May” (Boston, 1873).

MAY, Sir Thomas Erskine, an English author, born in 1815. In 1831 he was appointed assistant librarian of the house of commons, and was gradually promoted until in 1871 he became clerk of the house. He was knighted in 1866. In 1844 he published a “Treatise on the Laws, Privileges, Proceedings, and Usage of Parliament,” which is the acknowledged parliamentary text book, and has been often reprinted and translated into foreign languages. He has also published several other works on the practice and mode of procedure in the house of commons. In 1854 he collected and reduced to writing, for the first time, the “Rules, Orders, and Forms of Proceeding of the House of Commons,” which were adopted and ordered to be printed by the house. In 1861–73 he published “The Constitutional History of England since the Accession of George III., 1760–1860” (a continuation of Hallam’s work on that subject), which was reprinted in the United States and translated into French and German, and of which a third edition with a supplementary chapter appeared in 1871. He has also published the “History of Democracy in Europe.”

MAYAS, the race of Indians inhabiting Yucatan and some adjoining districts. By some ethnologists they are regarded as a distinct race, though the precise period of their arrival on the peninsula is unknown; others as descended from the Toltecs, according to which theory the first immigration must have taken place between 1050 and 1200; and others still imagine them to be the resultant of two races, one from the islands of Hayti, Cuba, &c., and the other from the west (Toltecs?), under the guidance of Zamana, a priest, who named the different parts of the coast and the interior, and was the first to train the people in the arts of civilization. The last theory appears the most plausible, inasmuch as nearly all writers agree in crediting the Toltecs with the introduction of civilization into the peninsula. As to their origin. Landa wrote that three brothers came from the west to Chichen Itza and ruled there; that after the death or departure of one, the two others became tyrannical and were slain; and that Cuculan (the Mexican Quetzalcoatl) reestablished order, founded Mayapan (a name afterward extended to the whole peninsula), and left the lordship to the house of the Coomes, about the 10th century. From the south (Chiapas) came large tribes, the Tutuxiu (also Toltecs), who aided the natives to overthrow the Coome dynasty and massacre the monarch of Mayapan, probably in the first half of the 15th century. The kingdom was then divided into upward of 40 petty seignories, all tributary and submissive to the bataye or cacique of Mani. Large numbers migrated to the adjoining district of Peten, where they are known under the name of Itzaes. Landa, and since him Stephens, Squier, and many others, rank the Mayas among the most civilized of American nations, with an
alphabet and a literature, cultivating the soil, manufacturing, having sailing vessels, carrying on trade, using a medium of exchange, and erecting temples and other edifices of stone, which, from their size and profuse ornamentation in carved and colored figures and bassi reliev, are, even in their ruined state (at Palenque, Uxmal, Chichen Izca, &c.), the most remarkable architectural relics in the western hemisphere. Orozco y Berra, Morelet, and other travellers and archaeologists, contend that the Toltecs alone could have been the builders of these edifices and cities; and Morelet strongly maintains this theory, which he bases upon the "indisputable analogy existing between these ruins and the ancient monuments of Tula and Mitla, and the geographical position of the former, which spread over the line of Toltec emigration." Be this as it may, it is certain that the Maya language bears no relation to the Toltec, but is the principal branch of the Huaxteco-Maya-Quiche family. Possibly the language of the immigrants from the West Indies prevailed to the exclusion of the Toltec, as the Maya has successfully resisted the influence of the Spanish tongue since the conquest. The Maya writing was of two kinds, one representing the letters of the alphabet, which lacks the Spanish d, f, g, j, r, and v, the other expressing syllables by characters. Landa gives the first alphabet, some samples of the second, and the signs of the months, with their system of numerals, with the help of which scholars have been enabled to decipher some of the ancient Maya manuscripts still preserved in Europe, as the Troano, Dresden manuscript, &c. They are written on long strips of prepared inner bark, folded in book form, the lines reading from right to left or from bottom to top. The Maya abounds in monosyllables, elisions, and synonyms; different meanings are given to the same word by tones. The plural is generally formed by adding ob, comparison by tl. The first grammars were drawn up by Villalpando and Landa; an Arte del idioma Maya, by Gabriel de San Buenaventura, was printed at Mexico in 1560, and others followed. That of Pedro Beltran de Santa Rosa Maria (Mexico, 1746) contained the first dictionary. In recent times many works upon the Maya have been issued by the abbé Brasseur de Bourbourg, including Grammatica de la lengua Quiche, drawn chiefly from the Teoro de las lenguas Quiche, Chakchikel y Tzutuhil de Francisco Ximenez (Paris, 1862), and Dictionnaire, grammair et chronomathie de la langue Maya, précédé d'une étude sur le système graphique des indigènes du Yucatan (Mexique) (Paris, 1872). His theories are not as readily accepted as the historical material he presents. A Maya dictionary by Dr. Behrend is now in press (1875).—The Maya flattened the head of their infants, painted the face and body, and tattooed their persons; the women filed their teeth, and wore pieces of amber in the cartilage of the nose; both sexes wore ear rings. They bathed frequently for religious purposes, and always washed their hands and mouth after eating; but they used a drink like mead, rendered intoxicating by the infusion of a root, and both sexes drank to excess. They had drums and wind instruments, and though some of their dances were obscene, the women were chaste and modest. As money they used shells, pieces of copper, or cacao beans. Their religion, as administered by the cheles or priests, was a terrible system, the victims being slain with arrows, or cut open and flayed after the heart was extracted. Others were thrown down the sacred pit of Chichen Izca. In war they used arrows tipped with obsidian or teeth of fish, flint-headed spears, and copper hatchets. They had bucklers and defensive armor made of quilted cotton with salt inside. Their year was of 18 months, each with 20 days, and 5 days 6 hours over. They had a bisexile year.

MAY Bug. See Cockchafer.

MAYENCE. See Mentz.

MAYENNE, a N. W. department of France, formed from the old province of Maine, bordering on the Loire, the Oise, the Seine, and the Sarthe; area, 1,866 sq. m.; pop. in 1872, 3,506,637. The surface is rugged and diversified. Iron, coal, and slate are
MAYER, Alfred Marshall, an American physicist, nephew of Brantz Mayer, born in Baltimore, Md., Nov. 13, 1836. He was educated at St. Mary's college, Baltimore. He has occupied the chair of physics, with chemistry or astronomy, in several institutions, as follows: University of Maryland, 1856-8; Westminster college, Missouri, 1859-61; Pennsylvania college, Gettysburg, 1863-7; Lehigh university, Pennsylvania, 1867-70; Stevens institute of technology, Hoboken, N. J., since 1871. In 1863-4 he studied in the university of Paris. At Lehigh university he superintended the erection of an observatory, from which he made a series of observations of Jupiter. He was in charge of the party sent to observe the eclipse of the sun at Gottingen, Aug. 18, 1869, and took 41 perfect photographs of the eclipse. At Hoboken he began his researches in acoustics, in which he has made his most important discoveries; among these are: the measurement of the relative intensities of sounds of the same pitch; an acoustic pyrometer; the connection of the pitch of a sound with the duration of its residual sensation; the reflection of sound from flames and heated gases; that the fibrils of the antennae of the mosquito are its auditory organs; the mechanism of hearing in mammals; and new methods of sonorous analysis. In 1873-75 he was one of the editors of the "American Journal of Science and Arts," from which he withdrew on account of weakness of sight, and visited England. Among his numerous scientific papers are: "Estimation of the Weights of very small Portions of Matter" (1858); "Lecture Notes on Physics" (1868); "Researches in Electro-magnetism" (1870 and 1879); "An Investigation of the Composite Nature of the Electric Discharge" (1874); and "Researches in Acoustics" (7 papers, 1871-4).

MAYER, Brantz, an American author, born in Baltimore, Sept. 27, 1809. His father was a merchant of German birth, engaged in trade with the East Indies and Mexico, and for many years consul general of Wurtemberg in the United States. After graduating at St. Mary's college, Baltimore, he sailed for the East, visiting Java, Sumatra, and China, and returned in 1828. He practised law from 1832 till 1841, when he was appointed secretary of legation to Mexico, where he remained a year, and on the same qualification, for a short time the "Baltimore American" newspaper. In 1867 he was appointed a paymaster in the United States army, a post which he still held in 1874. Among his works are: "Mexico as it was and as it is" (1844; 3d ed., 1847); "History of the War between Mexico and the United States" (1848); "Mexico, Aztec, Spanish, and Republican" (1852); "Calvert and Penn, or the Growth of Civil and Religious Liberty in the United States" (1852); "Captain Canot, or Twenty Years in an African Slaver" (1854); "Observations on Mexican History and Archeology," in "Smithsonian Contributions" (1857); "Mexican Antiquities" (1858); and "Baltimore as it was and as it is" (1871). He has also contributed to the Maryland historical society the "Journal of Charles Carroll of Carrollton during his Mission to Canada," and "Tah-gah-jute, or Logan and Captain Michael Cresap."

MAYER, Johann Tobias, a German mathematician, born at Marbach, Wurtemberg, Feb. 17, 1723, died in Gottingen, Feb. 20, 1762. He gained a living when a mere youth by teaching mathematics. He early made himself known by scientific productions. The university of Gottingen in 1750 chose him its professor of mathematics, and appointed him director of its observatory. His "Zodiacal Catalogue," comprising 14,000 stars, he observed that year; and his "Lunar Tables," published in 1755, were deemed of such value by the English astronomer royal that the British parliament awarded his widow £3,000. The most important of his discoveries was the principle of the "repeating circle," employed by Borda in measuring the arc of the meridian.

MAYER, Julius Robert, a German physicist, born in Heilbronn, Wurtemberg, Nov. 25, 1814. He received his early education in the gymnasmum of Heilbronn, and studied medicine at Tuebingen, finishing his course in Munich and Paris. In 1840 he made a voyage to Java, and spent the summer of that year in Batavia. While there he observed the venous blood of some of his patients had a singularly bright red color, and he came to the conclusion that it was due to the fact that a less amount of oxidation sufficed to keep up the temperature of the body in a hot climate than in a cold one. The darkness of the venous blood he regarded as the visible sign of the energy of the oxidation. His attention was drawn by this observation to the whole question of animal heat. One great principle of the physiological theory of combustion, he observes, is that under all circumstances the same amount of fuel yields by its perfect combustion the same amount of heat; that this law holds good for vital processes; and that hence the living body is incompetent to generate heat out of nothing. We are thus driven to the conclusion that it is the total heat generated within and without that is to be regarded as the true calorific effect of the matter oxidized in the body. From this again he inferred that the heat generated externally must stand in a fixed relation to the work expended.
in its production. He then sought to express this relation numerically. In the beginning of 1842 he had made considerable progress, but having in the mean time become town physician of Heilbronn, he could devote but little time to purely scientific inquiry. He determined however to publish a preliminary notice of the work then accomplished, and he contributed to the May number of Liebig's Annalen der Chemie und Pharmacie a brief but remarkable paper entitled Bemerkungen über die Kräfte der unbelebten Natur, which contained the germ of his future labors. In 1845 he published a memoir entitled Die organische Bewegung in ihrem Zusammenhange mit dem Stoßvorgange, in which he expanded and illustrated the physical principles laid down in his first paper, applying them to organic nature. In 1848 appeared his essay, Beiträge zur Dynamik des Himmels, in which he applied the same principles to the heavenly bodies. In 1851 he published another essay, Bemerkungen über das mechanische Äquivalent der Wärme, in which he developed yet further the mechanical theory of heat. His general argument is that all the mechanical motions upon the earth and all the phenomena of vegetable and animal life are produced by the sun's heat, the source of all power. Nature stores up the light which streams earthward from the sun and casts it into a permanent form. To this end she has overspread the earth with organisms which, while living, take in the solar light, and by its consumption generate forces of another kind. These organisms are plants, and the vegetable world therefore constitutes the instrument whereby the wave motion of the sun is changed into the rigid form of chemical tension, and thus prepared for future use. The physical forces collected by plants become the property of animals. Animals consume vegetables and cause them to reunite with the atmospheric oxygen. Animal heat is thus produced, and also animal motion. Mayer thus grasped the mechanical theory of heat, illustrating it and applying it in the most diverse domains. He began with physical principles; he determined the numerical relation between heat and work; he revealed the source of the energies of the vegetable world, and showed the relationship of the heat of our fires to solar heat. He followed the energies which were potential in the vegetable up to their local exhaustion in the animal. He then drew attention to the great amount of heat generated by gravity where the force has sufficient distance to act through. He found that the gravitating force between the earth and sun was competent to generate an amount of heat equal to that obtainable from the combustion of 6,000 times the weight of the earth of solid coal. He saw that this was a power sufficient to produce the enormous temperature of the sun, and also to account for the primal molten condition of the earth; and he concludes that the light and heat of the sun are maintained by the constant impact of meteoric matter. Similar conclusions in relation to the mechanical theory of heat were arrived at in England by Dr. James Prescott Joule almost contemporaneously with the investigations of Dr. Mayer; but there is no reason for supposing that either derived his inspiration from the other. Each was an independent creator of the theory. (See Correlation.) In the revolution of 1848 Dr. Mayer took what was called the side of order, which aroused against him the antagonism of many of his neighbors. His scientific labors were attacked, and this in connection with the loss of children threw him into an excited and sleepless condition. On May 28, 1850, being suddenly seized with a fit of delirium, he quitted his bed and leaped from a second-story window, 30 ft. high, to the street below. He recovered from the shock, but his mind was seriously affected. After spending some time in an asylum he was fully restored to health, and he now (1875) resides in Heilbronn. A complete edition of his works has been published under the title Die Mechanik der Wärme (Stuttgart, 1867). In 1871 the Copley medal was awarded to him by the royal society of London.

MAYER, Karl, a German pianist and composer, born in Clausthal in 1799, died in Dresden, July 2, 1862. His father was a clarinet virtuoso, and was attached to the military band of a regiment ordered to Russia in the campaign of 1812. He remained in Russia, and the young Karl received at Moscow lessons from the pianist John Field. In 1818 he went to Paris, and during 1819 resided at Brussels. After this he travelled through Germany, and then returned to Moscow, where, as well as at St. Petersburg, he was held in high esteem as a teacher. He eventually returned to Germany. He was one of the most graceful composers for the piano of his day, and his numbered works for that instrument are 351. His larger compositions consist of concertos and rondos for piano and orchestra.

MAYER, Karl Friedrich Hartmann, a German poet, born at Neckar-Bischofsheim, Wurttemberg, March 22, 1786, died in Tubingen, Feb. 25, 1870. He studied law at Tubingen, where he became chief councillor of justice. In 1838 he was a liberal member of the chamber. He was an intimate friend of Uhland, whose biography he published (Stuttgart, 1867). Several editions of his poems have appeared.

MAYFLY, an insect generally placed in the order neuroptera, with the dragon flies, ephemeræ, myrmeleon, and termites or white ants, forming the genus phryganea as restricted by Latreille. The jaws are hardly perceptible; the lower wings are broader than the upper, and longitudinally plaited; they have no sting nor piercer, and the antennæ are as long as the body; they undergo complete transformation, larvae and pupæ living in the water and feeding on aquatic insects and plants. The eggs are laid on the leaves of willows and other trees
overhanging the water, attached by a viscid matter; the small six-footed larve, when hatched, fall into the water, and there form for themselves cases of bits of straw, wood, leaves, stones, and shells, cemented together by a glutinous silk; they are hence called case or cadis worms; the larve protrudes its head and shoulders from the case when searching for food; the manner in which these cases are made, ballasted, and balanced affords a striking example of insect architectural ingenuity. (See Rennie's "Insect Architecture.") The pupa is incomplete, and is enclosed in the larve case, at one end of which is a silken grating through which the water for respiration is admitted and ejected; just before quitting the case the grating is cut through by a pair of curved mandibles, and the insect leaves the water by means of the four anterior legs, which are uncon- fined, to assume the perfect state. The flies as well as the larve are greedily eaten by fish, and are well known to anglers, who imitate the perfect insects by colored feathers as bait for trout, grayling, &c. Mayflies fly heavily, and generally alight on bushes near the water's edge; most of them are brown with cinerous, greenish, and yellowish markings; they include the willow, alder, green-tail, and dun flies, which cover the surface of the water during the cloudy days of spring, affording plentiful food for fish; as the season advances they appear chiefly in the morning and evening, and during the heat of summer are principally nocturnal. About 300 species are described, one of the largest of which is the P. grandis (Linn.) of Europe, nearly an inch long, with a spread of about 2 in.; the upper wings are brownish gray with cinerous spots, and the antennae as long as the body.

Kirby established the order trichoptera for these insects, which present some peculiarities connecting them with lepidoptera; the larve resemble the moths in making cases; the perfect insects have the wings hairy but scaleless, without reticulations, and the under ones folded longitudinally; the antennae are like those of moths, and the tibia are often armed with the two pairs of spurs observable in the latter; but they have not a spiral tongue, and the head has three single eyes as well as the usual compound ones; the abdomen is never furnished with terminal setae. There are some of the pyralides or delta moths, in the larve state living in leafy cases under water, and feeding on aquatic plants, which seem to make a transition to the trichoptera or this division of the neuroptera.—Another neuropterous insect, of the subulicorn family and genus ephemera (Linn.), is also called mayfly; the lower wings are much smaller than the upper, and both are carried perpendicularly; the abdomen is terminated by two or three setae; the antennae are short, and the body is soft, long, and tapering. These frail creatures appear in the winged state toward evening in summer, often in immense numbers; the E. albipennis, a European species, with white wings, occurs sometimes in such abundance in midsummer as to remind one of a snow storm. The larve are aquatic, and excavate burrows in the banks of streams under water, in which they are safe from fishes and yet amply supplied with food; after changing their skins several times they become nymphs, with the long caudal appendages and lateral fringes of the larve, but with rudimentary wing cases in addition; after attaining the winged state, they cast off a complete envelope of skin. Passing a year or two in their imperfect condition, they assume their perfect shape and sport for a few days, perhaps for a few hours only, in the summer day or evening. The fishermen of France call them manna from their furnishing abundant food for fish, covering the surface of the water with their countless swarms in August. (See Rennie's "Insect Transformations.") These are called day flies, and are imitated, as baits for fish. There are several in America.

**Mayfly** (Ephemera).
Davy. He is also author of "The Mormons, or Latter-Day Saints, a Contemporary History" (1852); "Upper Rhine," illustrated by Birket Foster (1858); "Lower Rhine" (1860); "German Life and Manners" (new ed., 1866); and, in conjunction with John Binny, "The Criminal Prisons of London" (1862).

II. Edward, born in London in 1813, was during his youth the manager of a strolling company, and in that capacity wrote "Make your Wills," and other farces. He has published a valuable manual on the "Management and Treatment of Dogs," "Treatise on the Mouth of the Horse" (1849), and "The Illustrated Horse Doctor" (1860).

II. Thomas, born in 1810, was one of the first to prepare cheap publications for the poorer classes, and started several "penny dictionaries," "penny grammars," and similar works, forming the "Penny National Library." He was at one time editor of the "Poor Man's Guardian," which during the agitation of the reform bill encountered the opposition of government in consequence of its radical opinions.

IV. Horace, born in London in 1819, besides sharing largely in the authorship of the books by the "Brothers Mayhew," published several humorous works under his own name, including "Change for a Shilling," "Model Men and Women" (1848); "The Toothache, imagined by Horace Mayhew, and designed by George Cruikshank" (1849); "Letters left at the Pastry Cook's" (1852); and "Wonderful People" (1856). He died April 30, 1872.

V. Augustus, who had an equal share with Horace and Henry in the production of the "Brothers Mayhew" series, has been an industrious contributor to periodical literature, and has published under his own name "Finest Girl in Bloomsbury" (1851); "Kitty Lamere" (1858); "Paved with Gold, or the Romance and Reality of the London Streets" (1858; 4th ed., 1872); "Faces for Fortune" (1866); and "Blow Hot and Blow Cold" (1869).

MAYHEW, Jonathan, an American clergyman, born in Martha's Vineyard, Mass., Oct. 8, 1720, died in Boston, July 9, 1766. He graduated at Harvard college in 1744, and in 1747 was ordained minister of the West church in Boston, a post which he filled during the remainder of his life. He was distinguished as a preacher and a writer of controversial tracts. His opposition to the proceedings of the British society for the propagation of the gospel in foreign parts and the introduction of bishops into the colonies involved him in a controversy with Dr. Apthorp and Dr. Secker, the archbishop of Canterbury. He cooperated with Otis and other early opponents of the arbitrary designs of the mother country, occasionally introducing his liberal opinions into his sermons with a boldness which ranked him among the ultra whigs. Among his published works are a volume of seven sermons (1749); "Christian Sobriety, in eight Sermons to Young Men," and "Observations on the Charter and Conduct of the Society for Propagating the Gospel in Foreign Parts." A memoir of him was written by Alden Bradford (Boston, 1838).
MAYO, 8 and 9 Victoria, cap. 25, the institution was placed on a new foundation, and endowed for the support and education of 500 students, and of 20 senior scholars on the Dunboyne foundation. Allowances are made to 350 members of the three higher classes and to the 20 Dunboyne scholars. Candidates over 16 years of age, and intended for the priesthood in Ireland, are admitted on the recommendation of their bishops, and no others can be received. The faculty consists of a president, vice president, four deans, a prefect of the Dunboyne establishment, who is also librarian, a bursar, four professors of moral and dogmatic theology, and one professor of each of the following branches: natural philosophy; sacred Scripture and Hebrew; ecclesiastical history; logic, metaphysics, and ethics; rhetoric and belles-lettres; humanity; English rhetoric and French; and the Irish language.

MAYO, a maritime county of Ireland, in the province of Connaught, bordering on Sligo, Roscommon, Galway, and the Atlantic ocean; area, 2,131 sq. m.; pop. in 1871, 243,855. The coasts are indented by numerous bays and harbors, the principal of which are Killala bay on the north, and Broadhaven, Blacksod, and Clew bays on the west. The surface toward the east is level and fertile, but the western districts are for the most part barren and mountainous, some of the summits attaining an elevation of more than 2,500 ft. The only important river is the Moy, but the lakes are numerous, the largest being Loughs Corrib, Mask, Conn, Cullin, and Carra, the two first named belonging in part to the county of Galway. The most important minerals are iron, marble, and slate; but the iron mines, though valuable, are not worked for want of fuel. Oats are the chief crop, but a large part of the land is devoted to pasture. The principal manufactures are linens, flannels, woollen stockings, and straw hats. Chief towns, Castlebar (the capital), Ballina, and Westport.

MAYO. I. Amory Dwight, an American clergyman, born in Warren, Mass., Jan. 31, 1823. He passed a year in Amherst college, then studied theology, was ordained, and was settled at Gloucester, Mass., over the Independent Christian church. Eight years afterward he removed to Cleveland, Ohio, and preached one year in the Congregational society of Liberal Christians. In 1855 he took charge of the first Congregational Unitarian society of Albany, and subsequently of a congregation in Cincinnati. He afterward became pastor of a church in Springfield, Mass., a post which he still occupied in 1874. He has contributed much to periodicals, and many of his writings in vindication of his peculiar religious tenets appeared in a serial publication, the Albany "Tracts for the Times." Among his works are: "The Balance" (Boston, 1847); "Graces and Powers of the Christian Life" (Boston, 1852); "Symbols of the Capital" (New York, 1850); and "Religion in Common Schools" (Cincin-

MAYO, Richard Southwell Bourke, earl of, a British statesman, born in Dublin, Ireland, Feb. 31, 1809, assassinated at Port Blair, Andaman islands, Feb. 8, 1872. He graduated M. A. at Trinity college, Dublin, in 1844, made a tour through the north of Europe, and in 1845 published a narrative of his observations in St. Peters burg and Moscow. He was a member of parliament from 1847 to 1866, and chief secretary for Ireland from March to December, 1852, again from February, 1858, to June, 1859, and for the third time from July, 1866, to September, 1868, with a seat in the cabinet. On the death of his father, Aug. 12, 1867, he succeeded as sixth earl of Mayo. He was appointed governor general of India in the latter part of 1868, and arrived at Calcutta in January, 1869. His administration was distinguished by executive ability and by the introduction of many reforms. Early in 1872 he set out upon a tour of inspection of the British provinces in India, and had reached the penal settlement of Port Blair when a Mohammedan convict broke through the guards and stabbed him in the back, killing him instantly.

MAYO, William Starbuck, an American author, born in Ogdensburgh, N. Y., April 20, 1812. He studied medicine, and after practising for several years assisted in the stock of a bookshop through the Barbary States and Spain. After his return he took up his residence in New York. His principal works are: "Flood and Field, or Tales of Battles on Sea and Land" (1844); "Kaloolah," purporting to be the autobiography of Jonathan Romer, describing his adventures in Africa (1849); "The Berber, or the Mountaineer of the Atlas," a romance of adventure similar to "Kaloolah" (1860); "Romance Dust from the Historic Placer," a collection of stories chiefly founded on historical incidents (1851); and "Never Again," a novel (1873).

MAYOR (Lat. major; Fr. maire), the chief municipal officer in a borough or corporate town. The office arose out of the immunities granted to free cities by sovereigns in the middle ages, and in England dates from the reign of Richard I., previous to which time the chief magistrate of a town was called portreeve or boroughreeve. In England mayors are addressed as "your worship," and those of London, Dublin, and York enjoy the prefix of lord to their titles by special royal grant. In France the maire is the first municipal officer in each
commune, and is charged with the preservation of public security, the preparation of statistics of marriages, births, &c., and with judicial power over certain minor offences. The chief executive officers of cities in the United States are termed mayors, and are elected annually or biennially by the citizens.

MAZARIN (Lat. major domus regis, or magister palatii), an officer of state in France under the Merovingian kings, who originally exercised the functions of royal steward, having the management of the king's estates and the direction of his household. By degrees these functionaries usurped almost the entire power of the state, the kings remaining such only in name, whence they were called roi feuxdants or lazy kings. This assumption of absolute power dates from the middle of the 7th century, when the administration of Austrasia, Neustria, and Burgundy was engrossed by their mayors, Grimolad, Archambaud, and Ebroin. Pepin of Heristal, mayor of Austrasia, from 688 to his death in 714 ruled France with absolute sway, and was succeeded by his natural son Charles Martel, whose son Pepin the Short, father of the emperor Charlemagne, took the title of king, and founded the Carolingian dynasty of French monarchs. The office then lost much of its importance, or was altogether abolished.

MAYSVILLE, a city and the capital of Mason co., Kentucky, situated on the Ohio river, at the terminus of the Maysville and Lexington railroad, 65 m. above Cincinnati, and 61 n. E. of Lexington; pop. in 1870, 4,705, of whom 681 were colored. It lies on a bend of the river, and is backed by a range of hills which give it a very attractive appearance. Among the public buildings are a handsome city hall, a court house, a substantial stone jail, and a hospital. The city has an active trade derived from N. E. Kentucky, and is one of the most extensive hemp markets in the United States. It contains three banks, two flour mills, two extensive griffon factories, one cotton factory, and chair, coach, and wagon factories. There are several public schools, a high school, a convent, an academy, one tri-weekly and three weekly newspapers, and twelve churches. It was settled in 1764, and incorporated in 1833.

MAZEA (Ital. MAZARINI, or MAZZA- NINO, GIULIO), cardinal, a French statesman, born at Piscina, in the kingdom of Naples, or according to some in Rome, July 14, 1602, died in Paris, March 9, 1661. He was of a noble Sicilian family, received his early education at Rome, and afterward studied law at the universities of Alcala and Salamanca in Spain. In 1635 he was a captain in the papal army. Even at this early age he displayed remarkable diplomatic talent, and was employed in important negotiations with the French and Spanish commanders in Italy. Entering the civil service of the pope, he was attached to the suite of Cardinal Sacchetti, the papal ambassador at Turin. In 1629 the cardinal returned to Rome, leaving Mazarin at Turin, with the title of interuncio and full powers to conclude a peace. In this capacity he went to Lyons in 1630, where he was presented to Louis XIII., and subsequently to Cardinal Richelieu, who succeeded in attaching him to the interests of France. In 1634 Richelieu caused him to be made vice legate of Avignon, and in 1641 procured for him a cardinal's hat from Pope Urban VIII. After the death of Richelieu in December, 1642, Mazarin became a member of the council of state; and on the death of Louis XIII. in May, 1643, the regent Anne of Austria made him prime minister. He at first pursued a cautious policy, affecting great humility and moderation; but a powerful party was soon organized against him, headed by the duke of Beaufort, the prince of Condé, the duchess of Longueville, and De Retz, archbishop-oadjutor of Paris. The people being already heavily taxed, the parliament of

and as it is an annual and easily exterminated, its presence is an index of careless cultivation.

MAZARE. See CESAIRE (II.).

MAZARIN, Jules (Ital. MAZARINI, or MAZZA-
NINO, GIULIO), cardinal, a French statesman,
born at Piscina, in the kingdom of Naples, or
according to some in Rome, July 14, 1602,
died in Paris, March 9, 1661. He was of a
noble Sicilian family, received his early edu-
cation at Rome, and afterward studied law
at the universities of Alcala and Salamanca
in Spain. In 1635 he was a captain in the
papal army. Even at this early age he dis-
played remarkable diplomatic talent, and was
employed in important negotiations with
the French and Spanish commanders in Ita-
ly. Entering the civil service of the pope, he
was attached to the suite of Cardinal Sac-
Paris refused to consent to a new impost, and the cardinal caused Blanchesnil, its president, and Broussel, one of its most popular members, to be arrested. Insignified by De Retz and the other leaders of the opposition, the citizens of Paris rose in insurrection in August, 1648, and thus began the civil war of the Fronde. Mazarin fled to St. Germain with the queen regent and the young king, and was proscribed by the parliament. Peace was restored March 11, 1649, chiefly through the influence of the great Condé, who, however, conducted himself with such arrogance that Mazarin caused him to be arrested and imprisoned, Jan. 18, 1650, together with the prince of Conti and the duke of Longueville. The parliament espoused the cause of the princes, and issued a decree of banishment against Mazarin. As the parliament was sustained by the people, the cardinal liberated the princes in 1651, and fled to Germany. His influence over the queen, to whom he is supposed to have been secretly married, was so great that he still governed the kingdom from his exile; and in 1652, the excitement against him having apparently subsided, he entered France at the head of an army of 6,000 men under the authority of a passport from the queen. The prince of Condé was at this time again in rebellion, and the young king Louis XIV., who had recently assumed his majority at the age of 13, was at Poitiers with his court, and toward that city Mazarin directed his march. The news of his return to France created great commotion in Paris. The parliament hastily assembled, decreed that the cardinal was a rebel, and ordered his magnificent library and other property to be sold, and from the proceeds of the sale 150,000 livres set apart as a reward to whoever should deliver him up dead or alive. Mazarin, regardless of these decrees, continued his march, and at the end of a month reached Poitiers, where he was received by the king and the court with the greatest demonstrations of delight. The civil war continued for some months longer, being carried on by the princes and the parliament on the pretext that the king was a prisoner in the hands of Mazarin, whose foreign birth made him peculiarly unpopular. At length the cardinal, finding that nearly all parties were weary of the contest and only needed an excuse for laying down their arms, tendered his resignation as prime minister, and withdrew from the court. The parliament then submitted, together with all the principal leaders of the Fronde except Condé, and the king returned to the capital amid the acclamations of the people. Louis immediately ordered Cardinal de Retz, the principal instigator of sedition, to be arrested and sent to prison at Vincennes. Mazarin, who had meanwhile taken command of the army on the frontier, and gained some successes over the Spaniards, sailed the ocean to return to Paris. The king and the courtiers went out several miles to welcome him, and he entered the capital in triumph, in the same carriage with the king, amid general rejoicings. His first care after his return was for the public finances, which were in great disorder, and next for his own. His financial skill and his thrifty habits soon restored his fortunes, and he advanced those of his family, which included a number of beautiful and profligate nieces. (See Mancini.) From his return to Paris till his death Mazarin ruled France with absolute power, the king quietly submitting to his guidance. His last great stroke of policy was his negotiation of the peace of the Pyrenees with Spain in 1659, and the marriage of Louis XIV. with the Spanish infanta, which was celebrated in the following year. Mazarin had accumulated during his administration 40,000,000 livres, an enormous sum at that time. On his deathbed his conscience troubled him about his property, and he gave it to the king, who after keeping it three days restored it, and it became the inheritance of his relatives. His "Letters" were published in Paris in 1745.

Mazatlan, a maritime city of Mexico, in the state of Sinaloa, at the head of a bay at the entrance of the gulf of California, 530 m. N. W. of Mexico; pop. in 1867 (according to official reports), 11,681; in 1871, 12,706, of whom about 4,000 constituted a fluctuating population, mostly merchants and traders, who in summer resort hither from Chihuahua, Sonora, Jalisco, Colima, and Durango. The upper part of the town, standing in front of rocky hills, is somewhat irregular; but that facing the bay contains some very good streets with handsome residences, mostly in the old Castilian style of architecture. There are five public squares, on the largest of which, the plaza de Armas, enclosed with railing, and embellished with orange trees, stand the chief public buildings. On a square near the beach are the custom houses, the offices and residences of the commandant and captain of the port, and the public stores, all tastefully constructed. The American consul reported in 1873 that many of the houses were vacant, and some as well as the custom-house wharf greatly decayed, and that business was rapidly declining. Other reports, however, are more favorable. The climate is damp, and in summer exces- sively hot, the mean temperature from June to October being about 90° F.; while during the remainder of the year the temperature ranges from 70° to 75° and frequent rains inundate the country, rendering travel almost impracticable. Silver mines abound in every direction, those which are worked on the largest scale being the property of Americans, and valued at $2,000,000. Although the soil favors agriculture, the only products are cotton, corn, and beans, for home consumption. Such immense quantities of bananas are used in the town and its neighborhood that the local sup- ply is quite insufficient, and the fruit is yearly imported to the value of about $200,000. The chief articles of export are dyewoods, fine pearls, and gold and silver. Mining machinery
and implements, and sugar, fruits, and vegetables, are brought from San Francisco; and the various cotton fabrics, &c., come from Europe. The value of the exports for the year ending Sept. 30, 1873, was $2,797,385, inclu-
ding gold and silver bullion and coin to the amount of $2,435,450; imports, $1,276,000. The import duties for the same year amounted to $758,300, and the export duties to $137,670. The entrances and clearances for the year were 53 steamers and 26 sailing vessels, with an aggregate tonnage of 117,493. There are six public schools (two primary and one grammar school each for both sexes), with an attendance of 400 scholars in 1867; besides which there were 21 private establishments for the primary and higher branches. The number of adults unable to read or write was in the same year 5,761.

Mazeppa, Jan, hetman of the Cossacks, born about 1645, died in Bendi, Turkey, Sept. 22, 1709. He was the son of a Polish gentleman in Podolia, and became page at the court of John Casimir, king of Poland. On returning to his native province he formed an improper intimacy with a married lady, whose husband caused him, according to the common story, to be tied to a wild horse, which was then let loose on the plains and ran till he reached the country of the Cossacks, where Mazeppa was unbound, and kindly treated by the inhabitants. Another account says that Mazeppa was fastened to his own horse, which brought him back to his own door, and that, unable to endure the disgrace of his position, he left his country and took up his residence among the Cossacks. However he may have arrived among them, his abilities soon gave him great influence, and on the death in 1687 of the hetman Samoilovitch, whose secretary and adjutant he had been, he was chosen to the chief command. He attained to high favor with Peter the Great; but when the Russians began to encroach on the liberties of his adopted country, he entered into secret connection with Stanislas Leszczynski of Poland, and subsequently into a league with Charles XII, of Sweden. These plans failed, Mazeppa being besieged by the Russians in his capital, Baturin, whence he escaped with an inconsiderable force. The defeat of Poltava (July 8, 1709) put it out of the power of Charles to aid him, and both fled to Turkey.

Mazzini, Giuseppe, an Italian revolutionist, born in Genoa, June 28, 1805, died in Nice, March 10, 1872. His father, who was a rich medical professor in the university of Genoa, gave him an excellent education. He learned the German, French, and English languages, studied jurisprudence, and before 1830 published several liberal essays in the Indicatore of Genoa and the Antologia of Florence. In 1830 he joined the carbonari, and soon afterward was imprisoned six months in the citadel of Savona, and then expatriated. He went to Marseilles, at that time the headquarters of Italian exiles, where he organized a league called la Giovene Italia, or Young Italy, and established a journal of the same name. Among the most active emissaries of Young Italy were sailors, who scattered Mazzini's publications all over the peninsula. The movement soon attracted the attention of the authorities. A private correspondence in cipher was intercepted, and disclosed the purpose of raising guerrilla bands, and other preparations for revolution. Extracts of this correspondence were published in the latter part of 1832 in the Roman journal Notizie del Gior-
no, and traced to Mazzini and his fellow conspirators. A circular inviting the cooperation of republican leaders in foreign countries was addressed, in February, 1833, to a journalist of Paris, and was signed Strozzi, the nom de guerre of Mazzini. His name was associated with political and military conspiracies which were discovered in Piedmont in 1833, and with their ramifications in Naples and other parts of Italy. After continuing for some time to issue his journal from a hiding place in Mar-
seilles, he was at length compelled to leave the French territory and to seek refuge in Switzerland, where, in connection with Polish, German, and other Italian refugees, he planned an expedition to seize the fortress of St. Julien in Savoy, and the small town of Annecy, which commanded the road to Chambéry, while an-
other wing of the revolutionists, under Ramorino, was to advance from Les Échelles to Chambéry, and to organize from that place military operations against Piedmont. The attack was made Feb. 1, 1834, at the frontier of Savoy, upon a few custom-house officers; the custom house was destroyed, and the insurgents advanced to the village of Annemasse, where a proclamation signed by Mazzini, Melegari, and Jacopo Ruffini, announced the formation of a provisional government at St. Julien; but it had no effect except to afford opportunities of smuggling during the confusion. The enterprise failed entirely. Sentence of death in contumaciam was passed by the Sardinian courts upon Mazzini, who however remained unmolested in Switzerland. Many of those implicated in the Savoy expedition were expelled from Switzerland, particularly the Polish refugees. But before their departure Mazzini obtained the cooperation of the principal representatives of the various nationalities in the organization of a new association to be called Young Europe. "Young Italy," "Young Poland," &c., appointed delegates, who on April 15, 1834, solemnly agreed to abide by the political, social, and religious platform which was laid down by Mazzini. The main object of Young Europe, according to Mazzini, was to lay the foundation for a universal development of thought and action, which would lead to the discovery and practical application of the divine laws of human government. Mazzini defined the league as the young Europe of the people, which was to supplant the old Europe of kings; as a conflict between the modern principles of freedom and the mediæval system of servitude, between the modern sentiments of equality and the old spirit of caste, monopoly, and privileges; and as a triumph of new religious aspirations and ideas over a decaying ecclesiasticism. The social application of Mazzini's principles is fully explained in his work, Foi et avenir (Bienne, 1835). Dissensions between Mazzini and the "Young Switzerland" (in whose interest a journal of that name had been published at Biéne chiefly under his influence) and "Young Germany" parties led him to withdraw from the central committee of Young Europe, and also of the Young Italy league, but without relaxing his zeal for the furtherance of the ends of both of these associations, of which he continued the principal leader. With the exception of a brief term of arrest in 1833, Mazzini was not interrupted in his agitation in Switzerland till 1837, when the Swiss authorities requested him to leave, and he went to London. His numerous partisans and friends continued the secret political agitation of Italy, while Mazzini labored by writing and by public addresses in the meetings of the Poles, Italians, or other oppressed nationalities in London. He wrote articles for various periodicals, among which are papers on Byron and Goethe, George Sand, Victor Hugo and Lamar-
of Venice, which from the beginning had acted in accordance with his republican views under the lead of Manin, and encouraged him to proceed to Florence. Here he became a member of the provisional government, and was sent as deputy to the Roman republic, which had been proclaimed in February, 1849. He was elected a triumvir by the Romans, and became the ruling spirit of the republic, which was soon suppressed by French intervention. Mazzini went to Lausanne, where he continued the journal L'Italia del Popolo, which he had commenced at Milan. He remained for some time in Switzerland, organizing there a new national committee for continuing his agitations. Returning to London, he united his efforts with those of Ledru-Rollin, Kossuth, Arnold Ruge, and other revolutionary leaders. His name was associated with the daguerreotype he worked out in Milan (Feb. 6, 1853), started by young enthusiasts who were led on by the inflammatory zeal of Mazzini, and promptly suppressed by the Austrian government. Orsini, formerly one of his most active partisans, in his memoirs published at Edinburgh in 1857, reproached Mazzini with recklessness and disregard of the lives of his friends. The latter, however, persisted in his propaganda; and notwithstanding the disapprobation of Manin and of other republican leaders, he again instigated an insurrection in Sardinia in 1857, and went to Genoa to superintend it. His followers seized Fort Diamante in the night of June 29; but as the people did not join the movement, Mazzini was compelled to abandon the enterprise. His friends who attempted similar outbreaks at Leghorn and Naples fell into the hands of the government, including those captured on board the steamer Cagliari, and were put to death or imprisoned, while Mazzini himself retired to his place of concealment near Genova, and afterward returned to London, where he published The late Insurrection defended by Joseph Mazzini" (1858). In January, 1858, his name was unjustly associated with Orsini's in the attempt to assassinate Napoleon III. At the end of that year he established in London a weekly journal, entitled Pensiero ed Azione. During the war of 1859 in Lombardy, he constantly resisted the idea that Italy could be benefited by the intervention of Napoleon III.; but he was warmly interested in the subsequent efforts to unify Italy, though he had not been a republican as well as united. In September, 1862, he published a manifesto to the people of Italy. In 1865 he was elected to the Italian parliament, but his election was annulled. After 1870 he resided principally at Genoa and Pisa. He was buried at Genoa, and it was estimated that 80,000 people witnessed his funeral. In addition to his literary works above noticed, he published L'Italie, L'Autriche et le peuple (English ed., London, 1849); Le pape au XIXe siècle (Paris, 1850); "Royalty and Republicanism in Italy" (London, 1850), translated into French with a preface by George Sand; "The War and the Commune" (1871), and other pamphlets. There are editions of his works in Italian (12 vols., Milan, 1861 et seq.) and English, "Life and Writings of Mazzini" (6 vols., London, 1864-70).—See Mazzini jugé par lui-même et par les siens, by Jules de Breval (Paris, 1853; translated into English); his "Life" by Simoni (1870); and "Joseph Mazzini, a Memoir," by E. H. V., with two essays by Mazzini (London, 1874).

MAZZOLINI, Lodovico, an Italian painter, born in Ferrara about 1481, died there about 1530. He was a pupil of Lorenzo Costa, and in small pictures, particularly his miniature altarpieces, attained great excellence. His architectural backgrounds are especially admired. His works are not numerous.

MAZZUCHELLI, Giovanni Maria, count, an Italian jurist, antiquary, and biographer, born in Brescia, Oct. 28, 1707, died there, Nov. 19, 1765. He was educated at Bologna, and afterward became keeper of the Quirinian library in his native city, where he devoted himself to Italian antiquities and biographical literature. He wrote Notizie storiche e critiche intorno alla vita, alle invenzioni ed agli scritti di Archimede Siraucamo (Brescia, 1837); Gli scrittori d'Italia, cioè notizie storiche e critiche intorno alle vite ed agli scritti dei letterati italiani (2 vols. fol., in 6 parts, 1765-75, not complete); and many other works. He left a vast collection of casts and medals, afterward engraved and published.

MAZZUOLA, Francesco. See PARMIGIANO.

MEAD, Larkin Goldsmith, an American sculptor, born in Chesterfield, N. H., Jan. 3, 1885. In 1892 he went to Brooklyn, N. Y., where for three years he was a pupil of Henry Kirke Brown. At Brattleboro, Vt., he modeled in snow a statue of the "Recording Angel," cut in marble in 1855. In 1857 he executed the colossal statue "Vermont," which crowns the dome of the state house, and in 1861 the statue of Ethan Allen, which stands in the portico. In 1862 he went to Florence, and produced the statues "Echo," "Sappho," "Joseph, the Shepherd," "The Mountain Boy," and a bust of "Echo." His first elaborate work in Italy was a group, "The Returned Soldier," executed in 1866. From 1865 to 1874 he was occupied upon the groups "Columbus's Last Appeal to Queen Isabella," and "America" for the soldiers' monument at St. Johnsbury, Vt., and executed the statue and corner figures for the Lincoln monument at Springfield, Ill., unveiled Oct. 15, 1874. Besides portrait busts, he has modeled "Venice, the Bride of the Sea," and "The Discovery of America," and in 1874 he completed for the state of Vermont a statue of Ethan Allen, to be placed in the old hall of representatives in Washington.

MEAD, Richard, an English physician, born at Stepney, near London, in 1757, died in London, Feb. 16, 1754. He studied at Utrecht, Leyden, and Padua. In 1703 he was elected a member of the royal society, and in the same
year was chosen physician of St. Thomas's hospital. In 1711 he was appointed anatomical lecturer to surgeons' hall, and in 1714 removed to London. In 1727 he was nominated physician to George II. He made valuable collections of books, antiquities, and works of art. His principal work was *Medicina Sacra* (London, 1748; translated into English, 1755), in which he maintains that demoniacal possessions were a species of insanity. His "Medical Works" were published in 1762 (4to, London).

MEADE, a N. county of Kentucky, on the Ohio river, drained by Otter and Spring creeks and other tributaries of the Ohio; area, about 400 sq. m. pop. in 1870, 9,485, of whom 1,294 were colored. It has an undulating surface and fertile soil. The chief productions in 1870 were 67,691 bushels of wheat, 464,674 of Indian corn, 122,130 of oats, 40,062 of potatoes, 539,000 lbs. of tobacco, 22,656 of wool, 94,440 of butter, and 2,437 tons of hay. There were 8,209 horses, 1,791 milch cows, 3,248 other cattle, 7,460 sheep, and 18,170 swine; 1 cotton factory, 5 flour mills, 4 saw mills, 1 distillery, and 3 wool-carding and cloth-dressing establishments. Capital, Brandenburg.

MEADE. I. Richard Kidder, an American revolutionary soldier, born in Nannsemond co., Va., about 1750, died in Frederick (now Clarke) co. in the early part of the 19th century. He was educated at Harrow school in England, and soon after his return to Virginia embarked in the revolutionary contest. In December, 1775, he commanded a company at the battle of the Great Bridge near Norfolk, the first fought in the state, and soon after he was appointed by Washington one of his confidential aides, in which capacity, with the rank of colonel, he rendered signal service throughout the war. He was with the commander-in-chief in all his great battles, and superintended the execution of Major Andrè. The latter part of his life was passed in Frederick co., occupied with agricultural pursuits. II. William, an American bishop, son of the preceding, born in Frederick (now Clarke) co., Va., Nov. 11, 1789, died at his residence near Millwood, Clarke co., March 14, 1862. He graduated at Princeton college in 1808, and three years later was ordained to the ministry of the Protestant Episcopal church. In 1814 he was active in procuring the election of Dr. Moore of New York as bishop of Virginia, and contributed materially to the establishment of a diocesan theological seminary at Alexandria, and various educational and missionary societies. In 1829 he was unanimously elected assistant bishop of Virginia, and in August of that year was consecrated in Philadelphia. He thenceforth assumed the chief care of the diocese, and in 1841, upon the death of Bishop Moore, became bishop. Ill health soon compelled him to seek for an assistant, who was provided in 1843 by the parish of Dr. John Johns of Baltimore. He was for several years the acknowledged head of the evangelical branch of the Protestant Episcopal church in the United States. His publications comprise "Family Prayer" (Alexandria, 1834); "Lectures on the Pastoral Office"; "Lectures to Students" (New York, 1849); and "Old Churches, Ministers, and Families in Virginia" (2 vols., Philadelphia, 1856). His life has been written by Bishop Johns (Baltimore).

MEADE. I. Richard Worsam, an American merchant, born in Chester co., Pa., June 23, 1778, died in Washington, D. C., in 1828. He was a son of George Meade, a Philadelphia merchant, who was active in the opposition to the stamp act, and made the continental government a present of $10,000 in gold. Richard went to Cadiz, Spain, in 1808, as a merchant and ship owner, and from 1805 to 1816 was United States navy agent. During the peninsular war he imported immense quantities of supplies into the port of Cadiz, and frustrated Victor's attempt to starve out the allied garrison. In 1810 his vessels carried thither 250,000 barrels of flour. In 1815 he incurred the ill will of certain members of the Spanish council of war, and on May 2, 1816, was imprisoned in the castle of Santa Catalina, where he remained two years, and was then released at the demand of the United States government. The case which has since become celebrated as the Meade claim grew out of the losses incurred by him at this time, and the ruin of his business consequent upon his long imprisonment. In 1819 a special tribunal appointed by the Spanish government awarded him a certificate of debt, which was signed by the king, for $491,153 62. In 1822 the commission appointed at Washington to consider such claims declined to receive this certificate, and demanded the original vouchers; but before these could be procured the session expired, and the fund was distributed among the other claimants. Subsequent attempts to get a re-hearing of the case have all been fruitless, though the most celebrated lawyers were retained, including Webster, Clay, and Choate. Mr. Meade had the finest private gallery of paintings and statuary in the country; it contained the only bust of Washington taken from life; and he is said to have been the first importer of merino sheep and sherry wine into the United States. II. George Gordon, an American general, son of the preceding, born in Cadiz, Spain, Dec. 30, 1815, died in Philadelphia, Nov. 6, 1872. He graduated at West Point in 1835, served in the Florida war, and resigned Oct. 26, 1836. From 1837 to 1842 he was an assistant engineer in the government survey of the delta of the Mississippi, the Texas boundary, and the N. E. boundary of the United States. On May 19, 1842, he was reappointed in the army as second lieutenant of topographical engineers. He served through the war with Mexico, was attached to the staff of Gen. Taylor and afterward of Gen. Scott, distinguished himself at Palo Alto, Rosca de la Palma, and Monterrey, was brevetted first lieutenant for gallant conduct, and on his return was presented with a
sward by citizens of Philadelphia. He was made captain of engineers in 1856, and was in charge of the surveys on the northern lakes till 1861. He was commissioned brigadier general of volunteers, Aug. 31, 1861, and took part in the action of Dranesville, Va., Dec. 20; at Mechanicsville, June 26, 1862; at Cold Harbor, June 27; and at Frazier's farm, June 30, where he was severely wounded. (See Chickahominy.) On June 18, 1862, he was made major of topographical engineers. He was engaged in the second battle of Bull Run, Aug. 29, 30; commanded a corps of the army of the Potomac in the Maryland campaign; was in the battles of South Mountain and Antietam in September; and was made major general of volunteers Nov. 29. At Antietam he was slightly wounded and had two horses killed under him. From December, 1862, to June 28, 1863, he was in command of the first corps and afterward of the fifth corps of the army of the Potomac, and was engaged at Fredericksburg and at Chancellorville. On June 28, 1863, he was suddenly called to succeed Gen. Hooker in command of the army of the Potomac; and on July 1–3 he fought the battle of Gettysburg. (See Geer'sanae.) He was made brigadier general in the United States army July 3. From October to December he participated in several minor actions in Virginia. From May 4, 1864, to April 9, 1865, he was, under Gen. Grant, in the immediate command of the army of the Potomac, from the battle in the Wilderness down to the capture of Petersburg and the surrender of Lee. He was made major general in the United States army, Aug. 18, 1864. On Jan. 26, 1866, he received the thanks of congress for the skill and heroic valor with which at Gettysburg he repulsed, defeated, and drove back, broken and dispirited, beyond the Rappahannock, the veteran army of the rebellion. From July 1, 1865, to Aug. 6, 1866, he was in command of the military division of the Atlantic, in 1866–7 of the department of the East, and subsequently of the third military district, comprising Georgia, Florida, and Alabama, with headquarters at Philadelphia. He became a member of the historical society of Pennsylvania in 1863, and of the Philadelphia academy of natural sciences in 1865, in which year he received the degree of L.L.D. from Harvard University. He died in a house which his fellow citizens presented to his wife, and after his death a fund of $100,000 was subscribed for his family.

MEADOW LARK, a starling, of the American genus sturnella (Vieillot). The body is thick and stout, the legs large, with hind toes reaching beyond the tail, which is short, even, and of narrow pointed feathers; the bill is nearly straight, and three times as long as high; inner lateral toe longer than the outer; hind claw nearly twice as long as the middle; feathers of head stiffened, the shafts above extended into a black bristle. The common species (S. magna, Swains.) is about 11 in. long, with an extent of wing of 16, and the bill 14 in.; the color above is dark brown, each feather with a brownish white margin and a pale reddish brown terminal spot; wings and tail with dark brown bars; yellow beneath, with a black pectoral crescent; sides, rump, and tibiae pale reddish brown, with blackish streaks; a light median and superciliary stripe, yellow in front of the eye, and a black line behind. It is found in the eastern United States to the high central plains, extending perhaps as far south as Mexico. It is abundant in the southern states in the winter, whence it proceeds northward as far as Maine to breed, returning in the autumn in small flocks; the flight is generally short, unsteady, and at a moderate elevation; the notes at early morning are loud and melodious. The males are very pugnacious in breeding time; the nest is made of grasses in a hollow of the ground, and is covered over like an oven; both sexes incubate; the eggs, four or five, are white, with reddish brown spots at the larger end; the young are hatched about the end of June in the middle states. The meadow lark is the friend of the farmer in its destruction of injurious larvae, but it sometimes pulls up the young corn, grain, and rice; it occasionally kills small birds, especially in confinement. In autumn and winter meadow larks are fat, and are sought by sportsmen; the flesh of the young is esteemed as food. On the Pacific coast is found a variety nearly resembling the other, but rather paler in tint, with the yellow on the chin and throat extending on the sides of the lower jaw. This bird is related to the starlings of Europe, of the genus sturnus (Linn.)

MEADOW MOUSE, the common name of the small rodents of the genus arvicola (Lacépè.) The molars are 3–3, and rootless; the ears are short, nearly hidden in the fur; the muzzle is broad and rounded; the tail shorter than the body, cylindrical and hairy, soles naked anteriorly; the skull short, deep, and broad; whiskers in five horizontal series. The common meadow mouse of this country (A. riparia, Ord) is 4½ in. long, and the tail about 1¼; the feet large and scaly; hair rather short; the eyes small; the thumb of the fore foot obsolete, and mamma four inguinal and four pectoral; the color above is dark brown, varied with reddish and yellowish brown; ashy plum-
MEADOW Saffron

beous below; tail and feet dusky. Many other species are described in vol. viii. of the report on the "Pacific Railroad Survey." The European species are called also campagnola and voles; the largest is the hypudaeus amphibius (Ill.), which is aquatic, inhabiting the banks of streams and digging in the marshes for roots. The campagnol (II: arctic, Ill.), of the size of a mouse, is yellowish gray above and whitish gray below; it lives in holes dug in the ground, in which it collects food for the winter. The economic meadow mouse (II: acronomus, Ill.) lives in Siberia, laying up ample winter stores, and sometimes migrating in large troops like the lemmings.—The meadow mice are spread over the northern hemisphere of America, Europe, and Asia, as yet not having been found in South America and Africa; they are abundant in the mossy swamps in the vicinity of the arctic circle. Some are aquatic, having the antitragus of the ear so developed as to act as a valve under water; others live in dry places and high lands, where they do much mischief by gnawing the bark of trees and destroying grain and fruit; they do not climb, and are not dormant in winter, but retreat at that time to their well stored burrows. They are very prolific, and hence are often the source of considerable loss to the farmer; in 1818 and 1819 most of the harvest of Holland, and in 1827 of that of an entire province of Italy, was destroyed by them; in a German province in 1822, 1,500,000 were captured in 14 days. These animals in their turn furnish a supply of food to carnivorous mammals, birds, and reptiles. For an account of their habits, see Audubon and Bachman's "Quadrupeds of North America."

MEADOW Saffron. See Colchicum.

MEADVILLE, a city and the capital of Crawford co., Pennsylvania, on the E. bank of French creek, and on the Atlantic and Great Western railroad at the junction of the Franklin branch, 82 m. N. by W. of Pittsburgh and 34 m. S. of Erie; pop. in 1850, 2,578; in 1860, 3,702; in 1870, 7,103. It is situated in the midst of a fertile country, and has an extensive trade with the oil regions. Its manufacturings are important, the chief establishments being machine works and woollen mills. There are also paper mills, an edge-tool factory, &c. The business portion is compactly built. In the suburbs is Green Dale cemetery, well laid out. The city contains a handsome court house, a state arsenal, an opera house, two national banks with a joint capital of $300,000, two savings banks, 19 graded public schools, including a high school, a public library with 2,500 volumes, a daily and three weekly newspapers, and 15 churches. Allegheny college occupies three buildings on a hill N. of the city. It was founded in 1815, and since 1833 has been under the direction of the Methodist Episcopal church. It is open to both sexes, and in 1873-'4 had 6 instructors, 40 preparatory and 64 collegiate students, and libraries containing 12,000 volumes. The Meadville theological school, under the control of the Unitarians, was established in 1844, and in 1873-'4 had 4 resident professors, 7 other instructors, 21 students, and a library of 12,000 volumes. Meadville was founded in 1789.

MEAGHER, a central county of Montana, bounded W. by the Missouri river; area, 7,650 sq. m.; pop. in 1870, 1,387. It is drained by Mussel Shell river and other affluents of the Missouri. There is some arable land, but gold mining is the chief industry. The census of 1870 returns 11 hydraulic and 93 placer mines as in operation. The chief productions were 26,771 bushels of wheat, 14,501 of oats, 11,324 of barley, 6,419 of potatoes, 19,594 lbs. of butter, and 1,768 tons of hay. There were 237 horses, 1,008 milch cows, 1,960 other cattle, and 436 swine. Capital, Diamond City.

MEAGHER, Thomas Francis, an Irish revolutionist, born in Waterford, Aug. 3, 1828, drowned in the upper Missouri, near Fort Benton, Montana, July 1, 1867. He was educated at Roman Catholic colleges in Ireland and England, and studied law in Dublin, where he became the leader of the Young Ireland party. In 1848 he assisted in organizing the Irish Confederation. On the overthrow of Louis Philippe in 1848, Meagher was sent at the head of a delegation to Paris to congratulate the French republican leaders. Soon after his return he was arrested for sedition, and released on bail, but was rearrested on a charge of high treason, found guilty, and received a sentence of death, which was commuted to transportation for life to Tasmania. From there he escaped, arrived in New York in May, 1852, and spent two years in lecturing on Irish independence in the principal cities of the United States. In 1855 he was admitted to the bar in New York, and in 1856 edited the "Irish News." In 1861 he joined the 69th New York regiment, of which he was acting major at the first battle of Bull Run. After the close of its three months' term of service he returned to New York, organized the Irish brigade, was colonel of the first regiment, and on the acceptance of the brigade was
MEAL WORM, the name given in Europe to the larva of a black heteromorphan beetle, the tenebrío molitor (Linn.). The perfect insect, about two thirds of an inch long, appears in the evening in the least frequented parts of dwellings, in flour mills, bake houses, and pantries. The larva is more than an inch long, cylindrical, scaly, and of an ochre yellow color; it is destructive to flour and meal, and to articles made from them; it is said to remain two years in this condition, and occasionally to have been eaten and rejected from the human stomach; it forms a favorite food for the domesticated nightingale. The name of meal worm is given in New England to the larva of a small delta moth (pyralis farinalis, Harr.). The moth is often seen on the ceiling of rooms, resting with its tail curved over the back; the fore wings are long and narrow, and cover the hind ones when at rest; they are light brown, crossed by two curved white lines, and have a dark chocolate spot at the base and tip of each. The larvae are long and slender, tapering at each end, naked, and with numerous legs; they are often seen in flour barrels, meal chests, and similar places. Some of the larvae of the moths of the genus tinea make a thick whitish gray web over corn and meal.

MEALY BUG, a very destructive insect in greenhouses, of the order hemiptera, and family coccidae or bark lice, the coccus Adonidum (Linn.). The perfect insects resemble small seeds; the reddish larvae are small, but very active, flat and oval in shape; the females have a beak with which they pump up the juices of plants; they fix themselves from time to time for the purpose of changing their skin, when they cover themselves with a white, powdery, cottony substance, which has given them their common name. Several broods are produced in a year, which cause great annoyance in houses; the eggs are deposited in a similar cottony material. In the natural state many are destroyed by ichneumon parasites and are devoured by birds. Alkaline washes are found most effectual in checking their ravages, both within and out of the greenhouse.

MEASLES, the See KINGCARDINESHIRE.

MEASLES (rubela, morbilli), a contagious exanthematos fever, attended with a characteristic eruption. Up to the latter part of the last century measles and scarlet fever were confounded together, or at least were esteemed, like simple and confuent smallpox, to be mere varieties of a common disease. Measles commences with the ordinary symptoms of fever, chilliness, loss of appetite, and lassitude, succeeded by heat of the skin, thirst, and frequency of pulse; but in addition to these, the attack is almost invariably attended with inflammation of the mucous membrane lining the air passages; the eyes are red and watery; there is delusion from the nostrils, hoarseness, and cough. The eruption commonly appears on the fourth day, at first about the head and neck, then the trunk and arms, and finally reaching the lower extremities; it takes two or three days to complete its course, and when it reaches the feet and legs has often begun to disappear from the face. The eruption consists of little papules, somewhat resembling flea bites, of a dark red color, which as they coalesce at their edges assume an irregular crescentic form. The period of incubation, that is, the time elapsing from exposure to the contagion to the time of attack, is put down as from seven to fourteen days. All ages are liable to it, though infants at the breast are not so apt to be attacked as those somewhat older. It often shows itself in newly recruited regiments, spreading from one individual to another so rapidly as to assume the form of an epidemic. The disease is not commonly dangerous, though when introduced into the Pacific islands, some years since, it proved exceedingly fatal. When the eruption is fully out, the cough, at first dry and troublesome, generally becomes softer and less frequent; and at the end of six or seven days from the coming out of the first papules they have disappeared. Where danger occurs, it is from inflammation of the air passages; the disease may thus become complicated with croup, or in subjects
MEASURES

MECCA

Measures. See weights and measures.

Meath, an E. maritime county of Ireland, in the province of Leinster, bordering on the counties Cavan, Monaghan, Louth, Dublin, Kildare, King's, and Westmeath, and the Irish sea; area, 903 sq. m.; pop. in 1871, 94,480. It has only about 8 m. of coast, and no harbor of importance. The surface is generally level, the soil fertile, and the climate healthful. Out are the principal crop, but only about one third of the land is under cultivation, the rest being devoted to grazing. The chief rivers are the Boyne and Blackwater. Coarse linens, cottons, frieze, paper, &c., are manufactured. The Midland Great Western railway and the Dublin and Belfast Junction railway pass through the county. The principal towns are Kells, the capital, Navan, and Trim.

Meaux, a town of France, in the department of Seine-et-Marne, 25 m. E. N. E. of Paris; pop. in 1866, 11,343. It is on the Marne, near the canal of Ourcq. Meaux is an episcopal town, and was the see of Bossuet, whose remains repose in the cathedral, and relics of whom are preserved in the episcopal palace. The cathedral dates from the 12th century, but is still unfinished. There is a communal college with a library of 15,000 volumes, and the town has a brisk trade in grain and cheese.

Mecca, the chief of the three holy cities of the Mohamedans, capital of the province of Hedjaz, Arabia, 63 m. E. of Jiddah, its port on the Red sea, and 250 m. S. of Medina, in lat. 21° 30' N. and lon. 40° 15' E.; pop. about 45,000. It lies in a narrow valley shut in by bare hills, from 200 to 500 ft. high. Its length from N. to S. is about 23 m., its breadth is somewhat less than a mile, and it is defended by a fortress on an elevation S. of the city. The houses are well built of brick and stone, and, unlike those of most oriental towns, have windows opening to the street; they generally contain apartments which are let as lodgings to the pilgrims who annually visit the holy city. The streets are broad and unpaved. The only public building worthy of note is the shrine or temple called Beit Allah, "House of Allah," or more commonly Caaba, "Square House." This great sanctuary, the most famous and holy in the Mohammedan world, stands in the centre of an oblong square, enclosed by a wall 250 paces long and 200 broad, none of the sides of which run in a straight line, though at first sight the whole appears to be of regular shape. Inside of the wall is a colonnade consisting of a quadruple row of pillars on the eastern side and of a triple row on the other sides. These pillars are more than 20 ft. high, and generally about 18 in. in diameter. Some are of white marble, granite, or porphyry, but the greater number are of common stone from the neighboring hills. Their number is variously stated; Burton counted 554. They are united by pointed arches, every four of which support a small dome plastered and whitened on the outside; these domes are 152 in number. Parts of the walls and arches are gaudily painted in stripes of yellow, red, and blue. The floors of the colonnades are paved with large stones badly cemented together. The Caaba is 115 paces from the northern colonnade and 88 from the southern. It is an oblong massive structure, 18 paces long, 14 broad, and from 35 to 40 ft. high, and is built of fine gray granite in horizontal courses of masonry of irregular depth; the stones are well fitted together with excellent mortar like Roman cement. It was entirely rebuilt as it now stands in 1827, a torrent in the preceding year having thrown down three of its sides. The roof of the Caaba being flat, it has at a distance the appearance of a perfect cube. At the S. E. corner of the Caaba is the famous "black stone," which is believed to have been brought from heaven by angels. It forms a part of the angle of the building, 4 ft. 9 in. from the ground, and is an irregular oval about 7 in. in diameter, with an
undulating surface composed of about a dozen smaller stones of different sizes and shapes well joined together with a small quantity of cement, and perfectly smoothed. It is said to have been broken in pieces by order of a heretical sultan in 1092, but was cemented together and bound with a silver ring. The color is black and metallic, and the stone is worn smooth by the lips of worshippers. Burckhardt thought it looked like a mass of lava containing several small extraneous particles of a whitish and of a yellowish substance; while Burton says it appeared to him like a common aérolite. The pilgrims who walk around the Caaba begin their procession at the black stone, which is touched and kissed with the highest veneration. A pavement of granite, polished like glass by the feet of the faithful, surrounds the Caaba. Outside of this pavement, which forms an irregular oval, is a line of iron posts supporting cross rods from which hang white or green glass globe lamps. The interior of the Caaba is plain, and there are no windows or any other opening except the entrance and a small door leading to a stair-case to the roof. The floor and walls are covered with marble of various colors, but mostly white; and the roof and upper part of the walls are covered with red damask embroidered with gold. The interior is lighted by many lamps, but there is no other furniture except a small press in one corner in which the key of the building is sometimes placed. Near the door, outside, is a small hollow, where Abraham and Ishmael are said to have mixed the cement for building the Caaba. On the N.W. side are the supposed graves of Ishmael and Hagar, enclosed by a semicircular wall covered with white marble. Opposite the E. corner is the zen-zen or sacred well, believed to be that of Hagar. Its water is unpleasant in taste, and has a cathartic effect; the Mohammedans ascribe to it great and peculiar virtues. None but Mohammedans are admitted to the Caaba, or its enclosure, but a few travellers from Christendom have ventured to enter in disguise at the risk of their lives. It was thus visited by Burckhardt in 1814, by Burton in 1852, and by Maltzan in 1862. Arafat hill, 12 m. E. of Mecca, is visited by all pilgrims, who must perform there certain devotions and listen to an annual sermon before they can justly claim to have performed the pilgrimage. It is about 200 ft. high, and rises from a gravelly plain on which the pilgrims pitch their tents. (See ARAFAT.)—The trade of Mecca is chiefly derived from the pilgrims, who come from all parts of the Mohammedan world, and generally bring merchandise with them. The people are lively and polished in their manners, and have a remarkable knowledge of languages. There are a few artisans, and some small potteries and dye works. The climate of Mecca is sultry and unhealthy, especially in August, September, and October. It was the birthplace of Mohammed. It is ruled by a sheriff, who at present is nominally dependent on the Turkish sultan. The Wahhabes took possession of Mecca in 1803 and held it till 1818, when they were expelled by the forces of Mehemet Ali, pasha of Egypt. The number of pilgrims to Mecca in 1873 was larger than for many previous years, and was estimated at 200,000. Of these, more than one half came by caravans; about 46,000 arrived by way of Jiddah and other ports on the Red sea, and for their transportation 12 ships, 87 steamboats, and a large number of small vessels were employed. Nearly 15,000 Malays and Hindoos came from India, embarking at Calcutta and Bombay. Turks, Egyptians, Mogrebins, and Caucausians, to the number of 20,000, came by way of the Suez canal; and there were 3,000 pilgrims from ports in the Persian gulf.

MÉCHAIN, Pierre François Andrè, a French mathematician and astronomer, born in Laon, Aug. 16, 1744, died in Castellon, Spain, Sept. 20, 1805. After receiving a limited education, he became a mathematical tutor, devoting his leisure hours to the study of astronomy. Trying to sell his telescope in order to assist his father, he attracted the notice of the astronomer Lalande, who procured him a situation as hydrographer under the government. In this capacity he assisted M. Bretonniere in surveying the French coast between Nieuport and St. Malo; but his attention was chiefly directed to the theory of eclipses and comets. 11 of the latter having been discovered and the orbits of 24 computed by him. In 1782 the academy of sciences admitted him to membership and awarded a prize to his "Memoir on Comets." Under the republic he was employed, together with Delambre, to measure the arc of the meridian comprised between Dunkirk and Barcelona. On returning to Paris, he refused to deliver his papers to the academy, because he had detected a difference of 64" in his calculations amounting to the latitude of Barcelona. After being appointed director of the observatory of Paris, he solicited the board of longitude to permit him to prolong the measurement of the arc from Barcelona to the Balearic islands, that he might have an opportunity of correcting his error. The board consented, and Méchais set out for Spain to conduct the operation, but fell a victim to an epidemic disorder on the way. The most important of his scientific papers are to be found in the Mémoires des savants étrangers, in the Transactions of the French academy, and in the Connaissance des Temps from 1786 to 1794, of which he was for some time editor.

MECHANICS, that branch of natural philosophy which treats of the action of forces on bodies. It is divided into statics, which treats of the action of forces in equilibrium, and dynamics, which treats of the action of forces on bodies in motion. Newton divided it into practical and rational mechanics, the former relating to the mechanical powers, and the latter to the theory of motion. In a restricted sense
the word mechanics signifies the inventing of machines (Gr. μηχαναν, to invent or construct), or at most consideration of the action of forces upon them, and this is the sense in which the ancients used it; but the science has long since passed beyond such limits, and comprehends the laws by which the motions of the heavenly bodies are governed, as well as those which affect their form, and also the action of gravitation upon bodies on the earth. Hydrostatics, hydrodynamics, and even sometimes pneumatics, are considered branches of the general science of mechanics. (See HYDROMECHANICS, and PNEUMATICS.)—The invention of simple machines for moving large masses of bodies is older than history. The lever and inclined plane were probably the first simple powers used, the construction of the latter being naturally suggested by the advantages offered by the natural slopes of hills. It is generally believed that the vast blocks of stone which are found in elevated positions in ancient Egyptian structures were raised to their places by inclined planes formed of earth on the exterior of the walls and afterward removed. The successive steps in the invention of machines have not been recorded, the work of Vitruvius on architecture, written under Augustus, being the principal source of information of those which were in use at that and before his time. From his descriptions there were then in use the lever, the wheel and axle, the simple and compound pulley, and a forcing pump for supplying the public fountains, whose invention he ascribes to Ctesibius of Alexandria, who flourished in the latter half of the 3d century B.C. Among other machines this mechanician also invented the clepsydra or water clock. (See CLEPSYDRA.) Vitruvius also describes a complex machine in which wheels acted upon each other by means of cogs, and which was used for measuring distances traveled by carriages or ships; and he describes at considerable length military engines for throwing masses of stone. Water wheels were used for grinding corn, and water was raised by buckets which were moved by wheels, the power being supplied by men walking on them. It is probable that most of the engines described by him were in use by the Greeks before the erection of the Parthenon. There is no positive evidence of the employment of the expansive force of steam as a moving power before the latter part of the 17th century, and then it was only used to raise water; and its general application to machinery dates only from the year 1768. Among the ancients, Archimedes seems to stand almost or quite alone in the power of conceiving in any great degree true theoretical ideas of mechanics. He explained the theory of the lever and some important properties of the centre of gravity, and also the fundamental doctrines of hydrostatics, particularly the equilibrium of floating bodies. The idea that the particles of a fluid have the power to communicate force with-out loss, in consequence of being perfectly free to move among one another, seems never to have been clearly comprehended before his time. Archimedes was so far ahead of his age that it was only within a comparatively recent period (the epoch of Galileo) that his doctrines became established. Before Archimedes the doctrines of Aristotle had been generally adopted in physics, and for many centuries afterward were accepted by the scientific world. Aristotle taught that all motion was naturally circular, an idea which lasted till the first law of motion was established. He divided motion into natural and violent, and accounted for the fact that a body thrown in a horizontal direction diminishes in velocity, while a falling body increases, by saying that the former is a violent and the latter a natural motion. In accounting for the continuance in motion of a stone thrown by the hand, he asks: "If the hand was the cause of the motion, how could the stone move at all when left to itself? If not, why does it ever stop?" He answers by saying: "There is a motion communicated to the air, the successive parts of which urge the stone onward, and each part of this medium continues to act for some while after it has been acted upon; and the motion which there begins to a particle which cannot act after it has ceased to be acted on." He attempted the discussion of the properties of some of the simple machines, and propounded some theories in regard to the lever, but even these have more the nature of mere suggestions. He asks why small forces may move great weights by means of a lever, and answers by asking if it is because the greater radius moves the faster; and he also queries whether a wedge affords power because it is composed of two opposite levers. As to the reason why a person when rising from a chair bends his knees when it comes to a par settle with his thigh, he suggests that it is because the right angle is connected with equality and rest. Here he again departs from the more philosophical method he had pursued with the arms of the lever, and returns to his usual metaphysical ones; and this is the tendency of most of the mechanical ideas of the ancients, with the exception, as has been observed, of those of Archimedes, which were unappreciated by his contemporaries. The latter, in his investigations concerning the properties of the lever, commences with the axiom that two equal weights balance each other on a lever of equal arms, and proceeds by employing the mathematical methods then in use to show that equilibrium always will exist in a lever when the bodies supported by it are inversely proportional to their distances from the fulcrum. Proceeding in his reasoning, he also concludes that there must be in every body a centre of force corresponding to the fulcrum in the lever. The principles which were so long ago clearly conceived by him were however not only undeveloped, but were not un-
understood, and were therefore neglected for many centuries, till they were revived by Galileo and by Stevinus. — The mechanical advantage of the inclined plane was one of the first and most important propositions which engaged the attention of mechanicians on the revival of physical science. Cardan in 1545 asserted that the force necessary to support a body on an inclined plane is double when the inclination is double. Guido Ubaldo in 1577 attempted to prove that an acute wedge will produce a greater mechanical effect than an obtuse one, but did not establish the proposition. His references to the screw, the inclined plane, and the wedge, however, show that he comprehended their relations. Michael Varro, whose *Tractatus de Motu* was published at Geneva in 1584, treats of the wedge in a manner which indicates at least an approach to the doctrine of the composition and resolution of forces. The explanation of the true theory of the inclined plane was first made by Stevinus of Bruges. He supposed a loop of a string, loaded with 14 equal balls at equal distances, to hang over a double inclined plane whose sides were in the proportion of two to one, and which would therefore support four and two balls respectively. That the loop must remain at rest followed from the fact that after any motion it would still be in the same condition as before, so that if motion took place it would go on indefinitely and result in perpetual motion, which he regarded as an absurdity. He shows that the festoon of eight balls hanging below the planes may be removed without disturbing the equilibrium of those resting upon the planes; so that the four balls on the longer plane would balance the two on the shorter, which would make the weights supported by the planes proportional to their length. Stevinus also shows that when three forces act upon a point, they will be in equilibrium when they are "proportion to the sides of a triangle which are parallel to the direction of the forces. He however only gives a demonstration of the case in which two of the forces are at right angles to each other. Leonardo da Vinci had before this obtained clear ideas regarding the equilibrium of oblique forces, as shown by extracts from his manuscripts published by Venturi in 1797. In 1499 Leonardo gave a correct statement of the forces exerted in an oblique direction on a lever, and made a distinction between the length of the arm of the lever and that of the perpendicular to the direction of the force. These views of Leonardo are believed to have been sufficiently known by Galileo to aid him in his speculations, and the modes of reasoning of the two are somewhat similar. Leonardo had also asserted that the time of descent of a body down an inclined plane is to the time of its vertical descent in the proportion of the length of the plane to its height. The most important discoveries of Galileo are in regard to the laws of falling bodies, as determined by his observations on the vibrations of a pendulum, which he found were proportional to the square roots of the lengths of the pendulum. He was also the first to enter into a mathematical investigation of the strength of materials in resisting strains. The problems regarding the collision of bodies were attempted by Descartes, who made some important observations; but no clear ideas or theories were obtained till Huygens in Holland and Wallis and Wren in England turned their attention to the subject, all these about the same time sending papers to the royal society of London. The first example of a correct solution of a problem of circular motion occurs in the theorems of Huygens. The problem of the centre of oscillation was proposed by Mersenne in 1646, and had attracted the attention of Huygens when a youth, but he was then unable to find any practical solution for its solution. But when, in 1673, he published his *Horologium Oscillatorium*, a fourth part of the work was on this subject, and the theories then advanced have been found strictly correct. In 1687 Newton's great work was published, when for the first time the science of mechanics was extended from a consideration of the actions of forces upon bodies on the earth to the action of forces exerted between celestial bodies, and the adoption of the theory of universal gravitation. It was enriched about the same time by the method of fluxions of Newton, and its improvement by Leibnitz, known as the differential calculus, an invention which greatly facilitated the investigations of mechanical problems. The illustrious family of Bernoulli of Basel, all of whom were natural philosophers, added much to the mathematical knowledge of mechanics. The transcendent mathematical powers of Euler gave analytical method to mechanical solutions. His memoirs occupy a large portion of the "*Philosophical Transactions of the Royal Society of London*" and so many were left at his death that their publication was not completed in 1818. In 1747 D'Alembert and Clairaut sent on the same day to the French academy of sciences their solutions of the celebrated "problem of three bodies" (see Moons), which for a long time claimed the attention of mathematicians. The labors of Clairaut have been of great service to the science of mechanics, but his name, and those of D'Alembert, Lagrange, and Laplace, belong more to the department of physical astronomy, and with others have received attention in the article *Astronomy*. — The subjects of friction, strength of materials, theory of arches and domes, perpetual motion, and hydromechanics, will be found under those heads. Universal gravitation is treated in the articles *Astronomy, Gravity, Moon*, and under other astronomical titles, and the science of projectiles under *Gunner*. This article will be occupied only with a consideration of the following subjects: 1. the laws of motion, including the laws of impact and uniformly
MECHANICS

accelerated rectilinear motion; 2, the composition and resolution of forces; 3, centrifugal force; 4, the pendulum; 5, the mechanical powers, or the theory of machines. Statical and dynamical principles will be treated in conjunction, as the subjects generally embrace both. 1. THE LAWS OF MOTION. These laws were pretty well recognized if not established before the Principia of Newton was written. Galileo, Kepler, Descartes, Wren, Halley, Hooke, and Huygens had successively advanced toward a comprehension of them, the two works of the last named, on the impact of bodies and on centrifugal force, containing assumptions, if not direct statements, of what are known as the three laws of motion. The mission of Newton was more to generalize these laws and apply them to the solution of the motion of the heavenly bodies. His Principia commences with a statement of the laws of motion, and it is in the form there given that they are generally known. They are as follows: Law 1. Every body continues in a state of rest or of uniform motion in a straight line unless acted on by some external force. This law results from the property of inertia, by which matter cannot give itself or deprive itself of motion. Law 2. Change of motion is proportional to the force impressed, and is in the direction of the line in which that force acts. Law 3. To every action there is always opposed an equal reaction. Force may be defined as any cause by which a body is moved, or held in any position, or has its motion changed. It may be the expansive force of steam and gases, animal power, the attraction of gravitation, or electricity. Inertia is that property of matter which offers resistance to any force tending to change its state of rest or motion, and it is an element of the greatest importance in mechanics, requiring consideration in every calculation where change of motion takes place. A body occupying a fixed place in space would be in a state of absolute rest; but ordinarily a body is said to be at rest when it is stationary with regard to surrounding bodies. A body is in absolute motion when moving from one point to another in space, and in relative motion when it is regarded as moving with respect to some other body. The velocity of a moving body is the distance it travels in a given time, the units of space and time being the foot and the second. Velocity may be uniform or variable. It is uniform when the body moves through equal spaces in equal times. Variable motion may be regular or irregular, and it may be accelerated or retarded. When it is accelerated in a constant ratio, it is said to be uniformly accelerated; and when in like manner retarded, it is said to be uniformly retarded.—Momentum and Impact. The force of motion in motion is called its momentum, and sometimes quantity of motion, and is equal to the mass or quantity of matter multiplied into its velocity; thus \( m = q \times v \), the unit of mass being generally considered the pound avoirdupois. A cannon ball weighing 100 lbs. and moving with a velocity of 1,200 ft. per second would have a momentum of 120,000 lbs. or 60 tons. When two bodies have equal momenta, their velocities will be in the inverse ratio to their quantities of matter; that is, if \( q \times v = q' \times v' \), then \( v = v' ; q' = q \). A force is impulsive when it acts for a moment only, like the stroke of a hammer. When such a force alone acts against a movable body, it necessarily causes uniform motion, a fact which may be shown experimentally by using Atwood's machine, as will be seen further on. When bodies meet by impact, the motion which results depends upon their degree of elasticity and upon their relative momenta. Bodies are elastic when they have the power of restoring their form after compression or expansion. There are no solids which are perfectly elastic, although glass and steel are nearly so within certain limits. Permanent gases are perfectly elastic, having the property of expanding after compression to their original bulk, and of being unchanged in their power of resisting pressure. (See Elasticity.) Vapors are also perfectly elastic for all pressures at which the liquids from which they are derived are above their boiling points. (See Boyle's Law.) Bodies are inelastic when they have no power of restitution after compression. Putty is almost perfectly inelastic. If an inelastic body, \( m \), fig. 1, is moving in the direction \( m \), and it encounters another inelastic body, \( m' \), which is at rest, the two bodies will after impact move together with a common velocity equal to half that which the body \( m \) had before impact; this having imparted half its momentum to \( m' \); therefore the momentum of the two bodies after impact must be equal to that of \( m \) before impact. If \( v \) represents the velocity of the body \( m \) before, and \( v' \) its velocity after impact, then \( mv = (m + m')v' \), and \( v' = \frac{mv}{m + m'} \). When two inelastic bodies, moving in the same direction with unequal velocities, collide, they will move together with a common velocity, and with a momentum equal to the sum of their momenta previous to impact; or \( mv + m'v' = (m + m')v' \), or \( v'' = \frac{mv + m'v'}{m + m'} \). If two bodies, \( m \) and \( m' \), fig. 2, moving toward each other, collide, they will come to rest if their momenta are equal; but if their momenta are unequal, they will after collision move together with a common velocity in the direction of the body having the lesser momentum, and with a momentum equal to the difference of momenta before impact; or \( mv - m'v' = (m + m')v'' \), and
$v'' = \frac{m-m'}{m+m'}$.—The following are among the propositions of Huygens on elastic bodies. If a body meets an equal body at rest, after impact the former will be at rest, but the latter will acquire the velocity of the impelling body. If two equal bodies moving with unequal velocities strike one another, they will after impact move with interchanged velocities. Any body, however large, is moved by any body, however small, and moving with any velocity whatsoever. If two bodies meet from opposite directions whose velocities are inversely in proportion to their quantity, each will rebound with the velocity with which it approached. These propositions may be experimentally verified by the apparatus shown in fig. 3. Let two elastic balls be suspended at equal heights by slender threads of a radius corresponding to the graduated arc a b. If one of the balls is raised and allowed to fall against the other, this will be impelled to a corresponding height; if both are raised to the same height and let fall, they will rebound to their original heights (theoretically); and if one is let fall from a greater height than the other, they will rebound with reciprocal velocities. If several balls are hung between them so that they touch each other, and impact is made by a terminal ball, all the intermediate balls will remain at rest, the impulse being transmitted through them to the opposite ball. If a perfectly elastic ball is thrown obliquely against a smooth plane, it will be reflected so as to make the angle of reflection equal to the angle of incidence. If the ball is imperfectly elastic, the angle of reflection will be greater than the angle of incidence; and if the ball is perfectly inelastic, it will not be reflected, but will slide upon the plane.—Uniformly accelerated Rectilinear Motion; Laws of Falling Bodies. As a consequence of the property of inertia, when a body has been put in motion and all force is removed, it tends to continue in motion with uniform velocity and in a right line. But if the force which caused the motion is uniform and constant, the body will receive equal increments of force during equal spaces of time, and therefore its motion will become uniformly accelerated. The most uniform constant known force at the surface of the earth is gravitation, and it is by its means that the laws of uniformly accelerated motion are studied. A body falling through the air does not in fact have its motion uniformly accelerated, because of the resistance of the air; but it can be proved by experiment as well as by a process of reasoning that such would be its motion in a vacuum. That all bodies near the surface of the earth tend to fall with equal velocities without regard to their density or bulk, is shown by the common guinea and feather experiment in a tube exhausted of air. The element of resistance of the air will not therefore, in considering the subject, be taken into account. The velocity of a falling body, in consequence of gravity being a uniform and constant force, will be in proportion to its time of fall, and its average velocity during any given space of time will be at the middle of that space; and therefore the velocity which a body in falling acquires at the end of any period of time will be double the average velocity from the commencement. Let the figures 1, 2, 3, 4, 5, 6 on the left of the column in the adjoining diagram represent the number of seconds during which a body falls from rest; they will also represent the velocities acquired at the ends of the seconds. Now, as the average velocity during the first two seconds is acquired at the end of the first second, and as the average velocity of the next two seconds is acquired at the end of the third second, if we represent the space fallen through during the first two seconds by S, the space fallen through during the third and fourth seconds will be represented by 8 S, and for similar reasons the space fallen through during the fifth and sixth seconds will be represented by 5 S. Therefore, during equal successive portions of time a body falls from rest through successive spaces represented by the odd numbers 1, 3, 5, 7, &c.; so that if the space through which it falls in one second be called a unit, that through which it falls during the first two seconds will be 1 + 3 = 4, and that through which it falls from rest in three seconds will be $1 + 3 + 5 = 9$ spaces; or the spaces through which a body falls from rest during 1, 2, 3, 4, &c., seconds will be proportional to the squares of these numbers. We thus by a process of reasoning, and without the assistance of experimental demonstration, arrive at the following laws of falling bodies: 1. The velocity acquired by a body in falling is proportional to the time of fall. 2. The spaces through which a body falls in equal successive periods of time vary as the odd numbers 1, 3, 5, &c. 3. The whole space through which a body falls from rest is proportional to the square of the time. 4. The velocity acquired by a falling body during any period of time, if continued uniformly, will carry it through twice the space in the same time; a law which follows from the second law, by which the spaces fallen through during equal successive periods of time increase by a constant quantity, which is twice the space through which a body falls from rest during one second. This constant quantity, which in this latitude is 32.16 ft., is usually

542 VOL. XI. 51
expressed by the letter $g$. The following table embraces the facts contained in these laws:

<table>
<thead>
<tr>
<th>TIME</th>
<th>Velocities acquired in values through in values fallen through in values of $g$.</th>
</tr>
</thead>
<tbody>
<tr>

</table>

These laws may be experimentally verified with considerable accuracy, but in order to do so it is necessary to reduce the velocity of the falling body, because a body dense enough not to be much affected by the resistance of the air soon acquires so great a velocity that it cannot be estimated with accuracy; and if the body is light, it soon meets with so much resistance that the motion becomes uniform. The most ancient method for diminishing the velocity was with the inclined plane, by Galileo. By referring to that part of this article which treats of the inclined plane, it will be seen that the force with which a body tends to move down such a plane is to the force with which it would fall freely as the height of the plane is to its length. If its height is 1 ft. and its length 16 ft., it will move down the plane 1 ft. during the first second, 3 ft. during the second second, and so on; and therefore through equal weights, $a$ and $b$, are suspended over a friction wheel placed at the top of a graduated post 9 or 10 ft. high. A platform, $p$, having a joint by means of which it may be suddenly dropped at any desired moment by connection with clockwork, is placed just below the wheel. The weight $a$ is placed upon this platform and loaded with a metallic bar, whose gravity is used as the accelerating force. At a chosen moment the platform falls and the weight begins to descend with accelerated velocity. A ring, $c$, placed at any desired distance below the platform, takes off the accelerating bar, after which the weight descends with uniform motion, only imperceptibly retarded by the air and an exceedingly small amount of friction. If the sum of the weights $a$ and $b$ is 99 ounces and the accelerating bar weighs one ounce, gravity acts practically on only one ounce, but it has to give motion to 100 ounces; therefore the velocity of descent will be $\frac{1}{100}$ as great as that of a weight falling freely; so that during the first second it will fall only 1'38 in., during the fourth second only 13'51 in., and during four seconds only 61'75 in. It will be observed that the velocity may be varied by changing the weight of the accelerating bar. By changing the position of the ring $e$ from one point to another, the rate of acceleration may be determined, and the velocity of motion attained at any point of time or space fallen through may be ascertained by measuring the uniform motion of the weights after the removal of the accelerating bar. The principal advantage of this machine is the facility it affords for estimating the relations between the accelerating force and the space described in a given time. Atwood's machine has been modified by Bourbouze so as to act somewhat on the principle of Morin's apparatus next described. The weights are set in motion by means of temporary magnets, and upon a cylinder covered with smoked paper curves are traced by a vibrating style, which is also moved by a temporary magnet. Morin’s apparatus is autographic, and in some respects, especially in its great accuracy and facility in verifying the law of acceleration, is preferable to Atwood's machine. Its essential parts are shown in fig. 5. A frame 8 or 10 ft. high holds the parts in position, which consist of a light wooden cylinder, $M$, about one third of the length of which is shown in the figure. It is turned by a weight, $Q$, suspended by a cord passing around a drum, $G$, which carries a cog wheel $c$ that plays into the endless screw $a$. At first the motion is accelerated, but after a short time, on account of the resistance of the air encountered by the revolving fan which is turned by the endless screw $d$, uniform motion is attained. Then, by pulling a cord, $K$, a lever, $A$, displaces a catch, $C$, which liberates a weight, $P$, which then begins to fall with accelerated velocity between two vertical guiding wires. The weight is provided with a pencil, $I$, which describes a line in descending upon

![Fig. 4.](image1.png)

![Fig. 5.](image2.png)

the 16 ft. during four seconds. But the results are not as accurate as with the employment of Atwood’s machine, a simplified form of which, to facilitate explanation, is shown in fig. 4. Two
the revolving cylinder, which, being marked with equidistant vertical and transverse lines, indicates at a glance the direction of the curve. When the paper is flattened out, this curve is found to be parabolic, thus showing that the spaces through which the weight falls are in proportion to the squares of the times. The other laws may also be verified by Morin's apparatus; but such verification is unnecessary, for the other laws are natural consequences of the law of squares. The following formulas are of frequent use in mechanical calculations. If the number of seconds during which a body falls from rest is represented by \( t \), and the space fallen through in one second by \( y \), the entire space fallen through will be expressed by the following equation: 

\[ s = \frac{1}{2}gt^2 \]  

(1). 

Now, as the velocity acquired in falling during one second is \( y \), and as velocity is proportional to time of fall, we derive the following equation: 

\[ v = gt \] 

Dividing this by \( t \), we have \( \frac{v}{t} = 2g \), whence \( v = \sqrt{2gy} \) (3). Example: What velocity will a body acquire in falling 1,000 ft., and what time will it occupy in falling? Taking (3), 

\[ v = \sqrt{2 \times 32 \times 1000} = \sqrt{640000} = 253.6 \text{ ft. per second.} \]  

Again, taking equation (1), \( s = \frac{1}{2}gt^2 \), we derive \( t = \sqrt{\frac{2s}{g}} = \sqrt{\frac{2 \times 3000}{32}} = 7.88 \) seconds. A body does not fall in a perfectly vertical direction, because the point from which it falls, in consequence of its greater distance from the earth's centre, describes a greater circle than the point to which it falls. It will therefore strike a point somewhat to the east—about one fourth of an inch for a fall of 150 ft. The motion of an ascending body is retarded by the same law as that by which a descending body is accelerated. 

II. COMPOSITION AND RESOLUTION OF FORCES. 

The union of two or more forces to produce a mechanical effect is called a composition of forces, and when a single force is replaced by two or more forces which produce the same effect, or when it is resolved into components for the purpose of mathematical analysis, such operation is called a resolution of forces. Analyses of cases must have regard to: 1, the quantity or intensity of the force or power; 2, the direction in which the force acts; and 3, the part of the body or load to which it is applied, and which is called the point of application. The quantity of force or power is usually expressed by assigning it a value in weight. It may also be represented by a straight line of proportionate length. Two or more forces acting in the same direction are equal to their sum; acting in opposite directions, they are equal to their difference. When two forces act together to produce a third, they may be represented by two sides of a triangle, while the resultant is represented by the third side. If a point is kept at rest by the action of three forces, these forces may be represented in quantity and direction by the sides of a triangle. Thus, the point \( a \), fig. 6, will be kept at rest when acted upon by three forces in the direction of the arrows \( b, c, \) and \( d \), where the forces are represented respectively in quantity and direction by the sides \( b', c', \) and \( d' \). 

If the adjacent sides of a parallelogram represent two forces in quantity and direction, the resultant forces will always be represented by the diagonal contained between them. Thus, if \( a \) and \( c \), fig. 7, represent two forces equal in quantity, having the direction shown by the arrows, their resultant will be represented by the longer diagonal \( a b \); but if \( a b \) and \( b d \) represent two forces acting in the direction of the arrows, the resultant will be represented by the shorter diagonal \( a d \). These propositions may be experimentally verified by the method of Gravesande. Let two weights of 8 and 10 lbs. be suspended over two frictionless pulleys by a string, as shown in fig. 8, and let a third weight of say 14 lbs. be suspended from this string, between the pulleys. After a time the system will come to rest. If now the string supporting the middle weight is extended upward vertically to some point as \( d \), and \( a d \) and \( de \) be drawn parallel to the strings \( a b \) and \( bc \), a parallelogram will be formed whose adjacent sides \( ab \) and \( bc \), and whose diagonal \( bd \) will have the respective values 8, 10, and 14. The point \( b \) is acted upon by three forces, represented by the respective sides of the triangle \( a d b \) in quantity and direction, the weight 8 acting in the direction \( be \), the weight 10 acting in the direction \( a d \), and the weight 14 acting in the direction \( d b \). The resultant of a number of forces acting upon the same point of a body may be determined by finding the resultant of the first two, and of this with the third, &c. This will be obvious by supposing four equal forces, \( ae, b e, c e, \) and \( d e \), fig. 9, acting at right angles to each other upon the point \( e \). The resultant of \( ae \) and \( be \) will be the diagonal \( fe \) of the parallelogram \( ae bf \); the resultant of \( fe \) and \( ce \) will be \( be \); and that of \( be \) and \( de \) will be
MECHANICS

zero; which will also appear by observing that the forces $ac$ and $cd$ balance each other, as also do the forces $be$ and $de$. The resultant of any number of forces may also be found by connecting the lines representing the forces, as shown in fig. 10. Suppose the forces to be represented in quantity and direction by the lines $ab$, $be$, $cd$, and $de$. The force which impels a sail vessel, moving with the wind off the quarter, is the resultant produced by the oblique action of the wind against the sails. Let $ab$, $bc$, and $dc$ the direction and force of the wind. This force may be resolved into the components $df$ and $fc$, the former parallel with and the latter perpendicular to the surface of the sail, and therefore the only force which is effective. But it is not acting in the direction of the keel, $mk$; therefore it must be resolved into the components $fg$ and $gc$, the latter of which will represent in quantity and direction the effective propelling force given by the wind, whose force is measured by $dc$.

Centre of Gravity. The point through which the resultant of all the forces caused by attraction of gravitation of the molecules of a body passes is called the centre of gravity. This point may be within the body, or, in consequence of its form, may be beyond it. The finding of the centre of gravity is a geometrical problem, but with an irregular-shaped body it can most easily be determined experimentally by suspending it in two positions, and finding the point of intersection of the two vertical lines which pass through the two points of suspension. This point of intersection will necessarily be the centre of gravity, for it is evident that it must reside in each of the two verticals, as each vertical is the resultant of all the gravitating forces of the body while suspended in any one position. In the case of bodies of uniform density and of geometrical form, the centre of gravity is readily determined by geometrical principles. In a circle or sphere it coincides with the geometrical centre. In a plane triangle it is at the point of intersection of two lines joining the vertices of two angles with the middle of the opposite sides, as shown in fig. 12. In a cone or pyramid it is in the line joining the vertex with the centre of gravity of the base, and at one fourth the distance from the base. A body is said to be in equilibrium when the centre of gravity and the point of support are in the same vertical line. When the point of support is above the centre of gravity, the equilibrium is said to be stable. Founded upon this is the sometimes so-called paradox of maintaining a beam in a horizontal position with only one end resting upon a support, as shown in fig. 13. The condition is easily understood if the beam $ab$ and the leaden ball $a$, with the attached bent rod, are considered as forming one body whose centre of gravity is at $c$. When this is vertically below the point of support the system will be in stable equilibrium. When a body has its centre of gravity above the point of support, but in the same vertical, it is said to be in unstable equilibrium. A distinction must be made between a state of stable equilibrium and a merely stable condition; for equilibrium implies a balance of force. A block, for example, may rest in a stable condition when lying upon the floor, although supported below its centre of gravity. But it cannot be said to be supported by a point; if it were, this point would need to be in a vertical with the centre of gravity. There are some cases of stable equilibrium when the centre of gravity is above the point of support.

Thus when the body is an oblate spheroid, stable equilibrium will exist when it rests upon one of its poles $a$ or $b$, fig. 14, because the centre of gravity occupies the lowest possible position. Disturbing the spheroid so as to bring the axis out of the perpendicular will raise the centre of gravity, and although it carries it to one side, as from $c$ to $c'$, the point of support is removed still further in the same direction, as from $b$ to $d$; and therefore gravity will bring the body back till the
axis is vertical. When the point of support
and the centre of gravity coincide, as in a
wheel, the equilibrium is said to be indifferent,
as is also the case when a sphere rests upon a
horizontal plane, because the centre of gravity
and point of support will always be in a vertical
line. A prolate spheroid or an egg, lying on its
side upon a plane, is in a state of stable equilib-
trium in one direction, and in that of indifferent
equilibrium in another. Supported at the pole,
the case becomes one of unstable equilibrium.
The vertical line which passes through the cen-
tre of gravity is called the line of direction of
the centre of gravity. A body will rest upon
a horizontal plane only when the line of direc-
tion falls within the base on which it rests;
and its degree of stability or power to resist
change of position depends upon the horizont-
al distance of the line of direction from the
edge of the base as compared with the height
of the centre of gravity above the base, or
upon the length of the arc which the centre of
gravity will describe when the body is raised
from a horizontal position of the base to that
in which the line of direction falls through the
edge of the base. Thus, if a horizontal plane
is rotated on one edge till its centre of gravity
falls in the line of direction, it will describe
the quadrant of a circle, as shown in fig. 18;

while the centre of gravity of a cube requires
in order to bring it vertically over one edge, as
shown in fig. 16. III. CENTRIFUGAL FORCE.
We will consider only the case of a body rev-
olving in a horizontal circle, and exerting
force only in the plane of the circle. Such
a force is exerted when a ball is placed upon
a horizontal rod, as shown in fig. 18, and ro-

tary motion is produced by turning a vertical axis. Let
d m, fig. 17, represent the horizontal rod, and c the
centre of motion, and sup-
pose the body to be placed
at m. The force exerted
upon it by the revolution
of the rod at each moment
is perpendicular to the rod
and in the direction of the
tangent m a. To prevent
its moving in that direction, therefore, some
force must be exerted to restrain it. In this
case the restraining force is the tension of
the bar, the body being fastened to it. This

force is called centripetal, and it is mani-
festly precisely equal to the force with which
the body tends to fly from the centre, or the
centrifugal force. By its action the body is
forced to move in the direction m a, and to
arrive at a in the same time it would without
restraint have arrived at c. The two forces
that have produced this deflection from m e to
m a are the force which is communicated
by the rod, which may be represented by b=ma,
and the centripetal force, which may be repre-
sented by the line m b, and which is precisely
equal to the force with which the body tends
to fly from the centre, or the centrifugal force.
It may be demonstrated that the centrifugal
force of a body moving in a horizontal circle is
equal to the product of its weight multiplied
into the square of its velocity, divided by the
product of the radius of the circle it describes,
multiplied by g = 92.16, or the constant ac-
celerating increment of a falling body. This may
be expressed by the equation \( c = \frac{v^2}{r^2} \). Let \( n \)
represent the number of revolutions or parts
of a revolution per second, and \( 2\pi r \) the cir-

cumference of the circle described by the
body; then \( 2\pi r n \) will be its velocity. Hence
\( c = \frac{v^2}{r^2} = g \cdot \frac{v^2}{r^2} = 1.2725 \times v^2 \cdot r^2 \).
Therefore the centrifugal force of a body re-
volving in a horizontal circle is equal to its
weight multiplied by the number of feet in the
radius of the circle, and this product by the
square of the number of revolutions or parts
of a revolution per second, and this by 1.2275.

Example: A ball weighing 10 lbs. is whirled in
a horizontal circle on a radius of 5 ft., making
16 revolutions per second; what is its cen-
trifugal force? \( 1.2275 \times 10 \times 5 \times 10^2 = 10,875 \) lbs.
(6936 tons). In agreement with these prin-
ciples are the first three of the celebrated prop-
ositions of Huygens appended to his Horolo-
gium Oscillatorium, which were then for the
first time advanced: 1. If two equal bodies
revolve in equal times in unequal circles, their
centrifugal forces will be proportionate to the
diameter of the circles. 2. If equal bodies
revolve in equal circles with uniform but un-
equal velocities, their centrifugal forces will
be proportional to their diameters. 3. If two
equal bodies traverse with equal velocity unequal circles, their centrifugal forces will be in the inverse ratio of the diameters. It follows from the first proposition that the centrifugal forces of any two bodies revolving around their common centre of gravity are equal. These propositions can be verified experimentally by employing the whirling table, fig. 18. A spiral spring which moves a registering index is fixed to one end of the horizontal rod. The adjustments may be so made as to cause a ball to revolve in any desired circle with any desired velocity. The applications of these principles are of daily occurrence. A horse or a carriage running in a circle exerts a centrifugal force requiring an inclination of the body toward the centre of the circle to counteract the tendency to be thrown over. The proper angle of inclination is found as follows: Suppose a horse to be running in a circle whose centre is $c$, fig. 19, and whose radius is $ac$. Draw the perpendicular $ad$ to represent the weight of the horse, and let $bd$, parallel with $ac$, represent the centrifugal force; then $ad$ will be the resultant, and the proper angle of inclination will be $ad$, whose tangent $= \frac{st}{gr}$. For tangent $\frac{bd}{st} = \frac{c}{w} = \frac{st}{gr}$. An inclination is imparted to railway carriages when traversing curves, by giving such an elevation to the rail on the outer curve of the track that the cross section of the latter shall be perpendicular to the required inclination or line of direction. Example: On a railway track 4 ft. 8 in. wide, how much elevation should be given to the outer rail on a curve of 600 ft. radius for a velocity of 30 ft. per second? Taking the equation $c = \frac{st}{gr}$, the value becomes $= \frac{900}{21\frac{1}{4}} = \frac{1}{21\frac{1}{4}}$. Therefore the outer rail must be raised $\frac{1}{21\frac{1}{4}}$ of 56 in. or 2.6 in. When any body is rotated it has a tendency to revolve on its shortest axis, in consequence of the greater momentum in the particles furthest from the centre of motion. When a body having the form shown in fig. 20 is turned on its longer axis by means of a string suspended from $c$, if the body is perfectly regular and the geometrical axis perfectly coincides with the axis of motion, it will not change its position; but as such coincidence never exists, the body will on being rotated begin to change its axis of rotation, and when sufficient speed is attained, the increased momentum resulting from the change of position will cause the body to assume a position at right angles to its first position, and revolve about its shorter axis. The oblate spheroidal figure of the earth and other heavenly bodies is due to the action of centrifugal force. (See Hydromechanics.)

IV. The Pendulum. A simple pendulum may be defined as a body whose weight is confined to a point, and which, suspended from a fixed point, vibrates in an arc. A simple pendulum can only exist in theory. A single vibration of a pendulum is the distance through which it oscillates from the point at which it begins to descend on one side of the vertical, as at $a$, fig. 21, to the point on the opposite side of the vertical, as at $b$, where its motion is arrested by the action of gravity. Its passage from $a$ to $b$ and back to $a$ is called a double vibration. All pendulums are compound because, having extension, their different particles are at different distances from the centre of motion, and therefore tend to vibrate in different times, because the time of vibration is increased by increasing the length of the pendulum. For small arcs the times of vibrations are the same; beyond certain limits increasing the arc increases the time. These facts were first ascertained by Galileo about 1685, when making use of the pendulum for counting time in astronomical observations. It has been demonstrated by mathematicians that if a pendulum vibrates in a small circular arc, the ratio of the time of one vibration to the time in which a body would fall half the length of the pendulum is equal to the ratio of the circumference of a circle to its diameter. Therefore, according to equation (1), substituting $l$ for $s$, and letting $t$ denote the time of one vibration, we have $t = \sqrt{\frac{l}{g}} : \pi : 1$, or $t = \pi \sqrt{\frac{l}{g}}$.

From this equation it will be observed that the time of vibration of a pendulum varies as the square root of its length. Squaring both members of the equation, $t^2 = \frac{\pi^2}{g}$, or $l = \frac{c^2}{g}$. A half-seconds pendulum is therefore found as follows: $l = (9\frac{3}{4} \times 82 \frac{1}{2} \times 16 \times \frac{96}{45} \times \frac{13}{3}) = 9\frac{7}{7}$. A seconds pendulum is 39\frac{1}{4} in., and a two-seconds pendulum 15\frac{3}{4} in. When the arc of vibration is 1° on each side of the vertical, the daily retardation compared to the vibration in an arc which causes no retardation is 1\frac{1}{2} second. When the arc is 2°, the loss is 0\frac{3}{4} seconds; when 3°, it is 15 seconds; the formula for estimating the retardation being $\frac{4D}{a}$, where $D$ represents the number of degrees the pendulum describes on each side of the vertical. The
inequalities in the times of vibration were obviated by Huygens by causing the pendulum to vibrate in a cycloidal arc, which he was the first to demonstrate is the curve of quickest descent from one point to another. To produce this cycloidal vibration, it is only necessary to cause the string by which the pendulum is suspended to wind around a semi-cycloid placed at each side, and to unwind from it when it falls from rest, as shown in fig. 22. The practical difficulties in the use of cycloidal arcs for pendulums are however greater than the advantage gained; therefore the pendulums of astronomical clocks are made to vibrate in small circular arcs. It has been said that in a compound pendulum there is a tendency in the different parts which are at different distances from the point of suspension to vibrate in different times. This will appear from a consideration of fig. 23. Suppose several balls, A, B, C, D, E, suspended by separate strings of unequal lengths from a horizontal bar at M. If they are all let fall at the same time from the line M E, the ball A on the shortest string will descend more rapidly than B, B more rapidly than C, &c., so that after a time they will have the positions A', B', &c. If they are all attached to the same wire and kept in the same line while vibrating, the balls moving in the smaller arcs will tend to accelerate the motion of those further from the centre of motion, and those vibrating in the larger arcs will tend to retard the motion of those nearer the centre of motion. Therefore there is a certain point where there is neither a tendency to retard nor to accelerate; this point is called the centre of oscillation of the system. The distance between this point and the point of suspension measures the length of a compound pendulum. If a homogeneous cylindrical bar is suspended at one end and made to vibrate, the centre of oscillation is two thirds the distance from the point of suspension. The discovery of the centre of oscillation, as we have seen, also marked an era in the science of mechanics, being one of its most important principles, and having a wide application. The centre of oscillation and the point of suspension of a pendulum are convertible points; that is, if the centre of oscillation is made the point of suspension, the time of vibration will not be changed; a principle which allows of the experimental determination of the centre of oscillation, and therefore of the length of the pendulum. The centre of oscillation may be entirely beyond the pendulum, as in the metronome, an instrument used to measure time in music. (See Metronome.) Its principle is shown in fig. 24, where a horizontal axis supports a rod, upon which there are two balls whose distance from the centre of motion may be varied at pleasure. If the balls are of equal weight and at equal distances from the centre of motion, they will not oscillate; but if unequal distances they will, and slowly in proportion as the difference of distance is small. The pendulum affords a correct means of finding the value of \( g \), and therefore the height through which a body will fall from rest in one second of time. Taking the equation \( l = \frac{g^2}{v^2} \) and transposing, we have \( g = \frac{v^2}{l} \). Therefore, if the length of the seconds pendulum is 39.1 in., the equation becomes in numbers \( g = 314159^2 \times 39.1 = 32.16 \) ft., which is twice the space through which a body will fall in one second of time.—The principal use of the pendulum is to measure time. To do this accurately, it is necessary to keep the point of suspension and the centre of oscillation at the same distance from each other, or in other words, to preserve a constant length. Increase of temperature causes a pendulum made of one piece to lengthen by expansion. If, however, two materials are so combined that while the expansion of one tends to lengthen the system, that of the other tends to raise the centre of oscillation, and the combination is such that the expansion of one shall exactly counteract that of the other, the desired end is attained. Such pendulums are called compensation pendulums. Two forms are shown in figs. 25 and 26. The bob of fig. 25 consists of a steel frame holding a hollow glass cylinder containing mercury. It is evident that if this mercury by its expansion causes the centre of
oscillation to rise just as much as the expansion of the rod causes it to descend, the length of the pendulum will remain unchanged. Now, as mercury expands about 14 times as much as steel, if the rod and frame are of steel, the column of mercury should be a little less than 6 in. for a seconds pendulum. Fig. 26 is the gridiron pendulum. It is made of brass and steel, whose rates of expansion are about 10 to 6. The bars are so arranged that the expansion of the brass shall exactly compensate that of the steel both in the gridiron and in the rod above it. The pendulum is used as a standard of measures of length. The length of a seconds pendulum at London was in 1824 declared by parliament to be 39-1398 in., and our government has adopted that standard. The French government in 1790 adopted as its standard the $\frac{1}{2} \times 393.5$ part of the quadrant of a great circle of the earth, which they called a mètre, equal to 39-37079 English inches.

V. MECHANICAL POWERS.—Theory of Machines. A machine is an instrument or contrivance by which force may be transmitted from one point to another. The force employed in working a machine is called the power; the resistance which the body acted on offers to the force is called resistance, weight, or load, and is expressed in terms of weight whose unit is usually the pound avoirdupois; the point at which the power is applied is called the point of application; the line of direction of the force is the line in which the force is applied, and in which it tends to make the body move, although it usually moves in the direction of a resultant. That part of a machine which is immediately applied to the resistance is called its working point. The power, like the resistance, is expressed in units of pounds avoirdupois. It is usual, in explaining the theory of machines, to neglect many conditions for the purpose of perspicuity and convenience, which are afterward taken into account. Thus the parts of a machine are primarily supposed to have no weight, to move without friction, and to encounter no resistance from the air. After the theoretical effects have been calculated, these accidental effects receive attention. Machines are divided into simple and compound. The definition of a simple machine is not so obvious as is often thought. It is sometimes defined as consisting of one part; but as the pulley and wheel and axle are called simple machines, this definition is not exact, because each of these consists of several parts. If we conclude, however, that the only simple machines are the lever, the inclined plane, and the cord, this definition may be accepted; but simple machines, or, as they are often called, the simple mechanical powers, have generally been divided into six classes, viz.: 1, the lever; 2, the wheel and axle; 3, the pulley; 4, the inclined plane; 5, the wedge; 6, the screw.—1. The Lever. This power may be defined as an inflexible bar resting on a fixed point or edge, called the fulcrum or prop. Levers are of three kinds, called the first, second, and third. The first kind is shown in fig. 27, where the fulcrum is between the power and the weight, and separates the two arms of the lever. These two arms are usually of unequal length, the weight having the same ratio to the long arm as the power has to the short arm. The second kind of lever, fig. 28, has the weight between the fulcrum and the power. The third kind, fig. 29, has the power between the weight and the fulcrum. In the first kind of lever it is evident that to produce equilibrium the power may be either less or greater than the weight, according as it is placed further from or nearer to the fulcrum. The proportion of power to resistance, in any kind of lever, to produce equilibrium is reckoned in the inverse proportion of the distance of these forces from the fulcrum; the weight multiplied into the distance from the fulcrum being equal to the power multiplied into its distance from the same point. It cannot therefore be said that the second and third kinds of lever have two distinct arms. In the second kind, the weight, being always near the fulcrum, must always be greater than the power; in the third, the power, being always between the weight and the fulcrum, must always be greater than the weight. As the distances through which the power and weight move are in proportion to their respective distances from the fulcrum, it follows also that equilibrium is maintained when the product of their weights into the distances they respectively travel, or in other words, into their velocities, are equal, and furthermore that when a weight is moved by means of a lever, what is gained in power is lost in velocity. The common steelyard is an example of a lever of the first kind, nut crackers of the second, and fire tongs of the third. All these three kinds of lever are found in various parts of the mechanism of the human body and in that of many of the lower animals. An example of the first kind is seen in the movement of the occipital bone upon the atlas or upper bone of the spinal column. The raising of the body upon the toes by the action of the muscles of the calf of the leg, if the ankle joint is considered as a fulcrum, is an example of a lever of the second kind. The action of the biceps muscle upon the forearm, where the elbow joint is a fulcrum and the weight is held in the hand, is an example of a lever of the third kind. The power or the weight may act upon
the lever in an oblique direction; but in making calculations the perpendicular distance of the lines of direction from the fulcrum must be regarded instead of the actual distances on the lever, as will be readily understood by observing fig. 30, where the power is applied in the direction $dp$, the long arm of the lever, $ca$, being practically reduced to the side $ce$ of the right-angled triangle $ceda$. When two or more levers, of one or more kinds, are combined, the system is called a compound lever. Platform weighing scales, such as are shown in fig. 31, are combinations of this kind, where the beam is a lever of the first kind, and $eb$, $ab$, and $gf$ levers of the second kind; if we consider the weights on the beam $km$ the power; but if we consider the load as a force acting on the platform and raising the weights at $p$, then $ab$, $eb$, and $fg$ become levers of the third kind.

—2. The Wheel and Axle. This power is a modification of the lever, and consists of a wheel and cylinder, or of two cylinders of unequal radii, revolving about a common axis, the larger cylinder being called the wheel and the smaller the axle. The wheel and axle may have the action of either kind of lever, but usually has that of the first, as shown in fig. 32, where the power is applied at $a$, the fulcrum is the axis $c$, while the weight is suspended from the short end of the lever, which is equal to the radius of the axle, the long end being equal to the radius of the wheel. If, however, the weight is suspended upon the same side with the power, and the latter is applied in an upward direction, as is often the case, the machine acts upon the principle of a lever of the second kind; and by applying the power to the axle the machine may be made to act as a lever of the third kind. Indeed, practically, levers are constantly changing in their action from one kind into another; thus a shovel or hay fork held in the hands may at one moment be a lever of the first kind and at the next one of the third kind, as the one or the other hand becomes fixed or movable. In the simple wheel and axle the mechanical advantage is in proportion to the ratio of the radius of the wheel to that of the axle; if the former is 5 ft. while the latter is 5 in., the ratio of power to weight is as 1 to 12. This mode of increasing the efficiency of the machine is often inconvenient, and may be obviated by employing a differential axle, consisting of two parts of different diameters, as represented in fig. 33, the cord winding upon one part and off the other, and the weight being supported by a pulley. The most common plan in machinery is to employ a system of cog wheels, as shown in fig. 34. An equilibrium of forces will obtain where the product of the power multiplied into the radii of all the wheels is equal to that of the weight multiplied into the radii of all the pinions. Cog wheels are of three kinds, spur, crown, and bevelled. A spur wheel is shown at $a$, fig. 35, a crown wheel at $b$, and bevelled wheels at $c$. They are used to change the direction of force or axis of motion. The wheel and axle when applied to carriages serves a different purpose from that in ordinary machinery, and acts in a different way. The action of the carriage wheel when ascending an inclination is like that modification of the inclined plane called the toggle joint (fig. 44). When the road is a rigid and level plane, the wheel merely serves to afford successive supporting points to the load, the only resistance to be overcome being the sliding friction of the axle and the rolling friction between the wheel and the road. (See Engrgr.)—8. The Pulley. The pulley is commonly said to act upon the principle of a lever of the first kind with equal arms, but this does not explain its principle. In fig. 36 we have indeed a lever of the first kind, with equal arms $ac$ and $cb$; and fig. 37 shows another such lever in the
stationary pulley, and also a lever of the second kind in the movable pulley, where the power is applied at \( f \), the weight suspended at \( b \), while the fulcrum, which is changeable as the pulley ascends, is at \( a \). This would seem to account for the mechanical advantage, which is in the ratio of 2 to 1; but in place of the pulleys there may be substituted smooth cylinders which shall not revolve, and if they are well lubricated a similar mechanical advantage is obtained as when revolving pulleys are used. In this case there is evidently no use of a lever, so that it must be concluded that the mechanical advantage which is obtained is derived from the use of the cord. The system of pulleys shown in fig. 38 may include any number, the mechanical advantage being doubled with every additional movable pulley; for it is evident that the cord \( a \) sustains half of the weight \( W \), and the cord \( c \) half of this, or one fourth of the whole; and further, that the cord \( e \) or \( f \) sustains one eighth of the whole. Several pulleys may be placed in one block. Instead of having one fixed pulley and the others movable, they may be placed in two frames or blocks, as shown in fig. 39, one block being fixed and the other movable. In this case one cord goes round all the pulleys, and therefore the weight is divided equally between the parts of the cord in the lower block, which parts are equal to twice the number of pulleys in the block. In this arrangement, where there are three pulleys in each block, the power will therefore be to the weight in the ratio of 1 to 6. The pulley is a very portable and efficient power, the cord allowing great freedom in changing the direction in which the power is applied, by the employment of fixed single pulleys, which may be fastened to the ground, allowing of the application of horse or steam power, or of any desired number of men. The rigging of ships is almost entirely managed by means of the pulley, and the hoisting of building material is to a great extent effected by the same machine.—4. The Inclined Plane. This power depends for its efficiency in the elevation of great weights upon the nearness with which the plane approaches to a horizontal surface. The power required to produce the equilibrium of forces on an inclined plane may be determined in the following manner: We will suppose two cases, the first in which the power is applied in a direction parallel to the plane, and the second in which it is applied in a horizontal direction, or parallel to the base. Let \( m \), fig. 40, be the centre of gravity of a freely moving body resting on a plane whose length is \( a b \), and whose height is \( b e \). Let the perpendicular \( m e \) fall from the centre of gravity upon the plane; also draw \( m d \) perpendicular to the plane. Let \( m e \) represent the force of gravity, then will \( m d \) represent the pressure perpendicular to the plane, and \( d e \) or \( m l \) will represent the force in quantity and direction with which the body tends to move downward along the plane. An equal force acting in the opposite direction will therefore produce equilibrium. Since the triangle \( m e d \) is similar to \( a b e \), \( e d : e m :: b e : a b \). Consequently, when the power is applied in a direction parallel to the plane, equilibrium will exist where \( p : w :: \) height of plane \( : \) length of plane, or \( p : w :: \sin a : \text{rad} \). In the second case, where the power is applied in a direction parallel with the base, produce \( m d \) to \( h \), and draw \( e h \) parallel to the base; then will \( e h \) or \( m b \) of the parallelogram \( m e h k \) represent the force necessary to produce equilibrium, and \( m h \) will represent the pressure perpendicular to the plane. But in this case \( e h :: e m :: b e : a e \). Therefore, power \( :: \) weight \( :: \) height of plane \( : \) length of base of plane, or \( p :: w :: \sin a :: \cos a \).—5. The Wedge, fig. 41, is a double inclined plane. It is used for forcing asunder bodies which offer great resistance, such as fibres of wood and the seams of rocks. It is usually propelled by percussion, which is applied to the head in the direction of its length, from \( a \) to \( b \). The forces will be in equilibrium where the proportion of power to resistance is the same as that of thickness of...
head to length of wedge. It is, however, difficult to estimate the power of percussion. To make the instrument effectual, considerable friction is required to prevent the resistance from forcing the wedge out of the crevice into which it has been driven.—6. The Screw. This machine is another form of the inclined plane. If a triangular piece of paper is wound around a cylinder, as shown in fig. 42, it will illustrate the formation and principle of action of the screw. In passing once around the cylinder, the height between two adjacent layers of the edge which forms the hypothenuse will represent the height of a plane which has the circumference of the cylinder for its base. The power is applied by means of a lever, and in a direction at right angles to the axis of the screw, or in a direction parallel with the base of the plane. Therefore the forces are in equilibrium where the proportion of power to resistance equals that of the distance between the threads to the circumference of a circle described by the revolution of that point in the lever to which the power is applied. The distance between the threads is measured in the direction of the axis of the cylinder. The power of the screw is increased by increasing the length of the lever by which it is turned, or by diminishing the distance between the threads. It may also be increased by letting a screw with comparatively fine threads pass within another having coarser threads, thus causing the height of the plane to be practically diminished to the difference in distance between the threads. This form is called Hunter’s differential screw. An endless screw is often combined with spur or crown wheels in the manner shown in fig. 43. It is often employed to measure minute spaces, as in the dividing engine for graduating mathematical instruments. (See Graduation.—Toggle Joint. The toggle joint, or elbow joint, which is used in various kinds of presses, consists of two radii or arms joined together by a hinge, as shown in fig. 44. The power may be applied at the hinge or joint a, usually in the direction a m, forcing the ends b and c further apart, and with great power as the arms approach a right line. It may also be applied at b and c, drawing the ends together, and forcing the point a outward in a transverse direction; a form used in hay and cotton presses. That this machine acts upon the principle of the inclined plane may be demonstrated as follows: Consider the end b of the radius a b to be stationary. The power being applied in the direction a m, the point a will describe the arc of a circle a d. A tangent to this arc, at any point in which the joint a may be moving, will represent the inclination, and m n the height of the plane by which the equilibrium of forces is determined. If the radius a b is inclined at an angle of 45°, then the inclination of the plane will be 45°; so that if we consider it to have extension, its base will be equal to its height, and the power being applied in a horizontal direction it will produce equilibrium when it is opposed to a force having the effect of an equivalent weight suspended vertically from a. As the point a approaches d, the tangent will approach a horizontal direction, and at last become perpendicular to the radii a b, a c, which will then be brought to form one and the same straight line, the theoretical force at this instant becoming infinite. The ratio of power to resistance in the case represented in the figure is as m n: a m, or as the height of the plane is to its base; or p: w:: see b —cos b : sin b.—A carriage wheel in overcoming an obstacle acts upon the same principle. Let c, fig. 45, be an obstacle, and a g the line of draught. The weight, sustained by the axle at a, acts perpendicularly, and to overcome the obstacle this point must be raised to the position a e, and of b, vertically above it. At first the motion of the axle will tend in the direction of the tangent a d, and there will be equilibrium when p: w:: d g: a g. It will successively move straight line in the direction of tangents at every point in the arc a b, until it will finally take the direction of the horizontal tangent f b, when the obstacle will be overcome. This action has also been explained upon the principle of the lever of the first kind. The obstacle is considered as a fulcrum supporting the bent lever a e n, the arm to which the power is applied at the axle being the radius of the wheel, a c, and the other arm, a n, the horizontal distance from the obstacle to a vertical let fall from a. The
point n in this vertical is supposed to support the load. The practical length of the arm a c is the perpendicular drawn from c to the line of draught; thus, if the line of draught is in the direction d, g, p : = z, nz : gc. The load, however, is actually supported by the axle at a, and the power is also applied at the same point, so that the analogy of the action to that of the lever is not as close as to that of the inclined plane.—For a further consideration of the science of mechanics, besides the works of Huygens, Newton, and others already mentioned, see L. N. M. Carnot, Principes fondamentaux de l'équilibre et du mouvement (Paris, 1803); James Renwick, "Elements of Mechanics" (Philadelphia, 1832); Poisson, Traité de mécanique (Paris, 1833); the Rev. H. Moseley, "A Treatise on Mechanics" (London, 1834); Christopher Bernoulli, Elementarisches Handbuch der industriellen Physik, Mechanik und Hydraulik (Stuttgart and Tübingen, 1834–5); W. B. Carpenter, "Elements of Mechanical Philosophy" (London, 1844); Arthur Morin, Léçons de mécanique pratique (Paris, 1839); "Appleton's Dictionary of Mechanics" (New York, 1858); W. H. C. Bartlett, "Elements of Synthetic Mechanics" (New York, 1871); W. G. Peck, "Elements of Mechanics" (New York, 1873); and Thomson and Tait's "Natural Philosophy" (London, 1874). The reader may also consult Bibliotheca Mechanico-Technologica, by Engelmann (Leipsic, 1844).

MECHELN, or Meckenen, Israel von, a German engraver and painter of the latter half of the 15th century. From the difference in the style of the Mecheln prints, of which upward of 300 are known, it is almost certain that there were two artists of the name. Their works are among the earliest specimens of the art. About the latter half of the 16th century flourished an artist of the school of Cologne, who is generally designated as the "master of the Passion," from his chief work, a representation of the Passion on eight panels. Several other works by the same hand are extant in Germany, painted in the stiff Gothic style, with something of the manner of the Van Eycks. By some this unknown artist is supposed to have been identical with Israel von Mecheln the younger.

MECHERINO. See Beccafumi, Domenico.

MECHI, John Joseph, an English agriculturist, born in London, May 22, 1802. His father, an Italian, was a member of the English royal household. The son became a clerk in a mercantile house, speculated in a small patent, and in 1827 set up in business as a cutler. By the sale of "magic razor," aided by liberal advertising, he acquired a fortune; and in 1840 he bought a farm of 170 acres at Tip-tree heath, Essex, where he made the experiments in scientific agriculture for which he became widely known. These experiments at first subjected him to much ridicule, but finally changed the farm from one of the most sterile into one of the most profitable. He collects the manure in a vast reservoir, liquefies it, and distributes it by a steam engine, through subterraneous pipes, over all parts of the farm, which it fertilizes and irrigates at the same time. Mr. Mechi has been an alderman and sheriff of London, and was a commissioner to the Paris exhibition of 1855. He has published "Letters on Agricultural Improvements" (1845), "Experience in Drainage" (1847), and "How to Farm Profitably" (1859; 4th enlarged ed., 1871), &c.

MECKTAR. See Mekitar.

MECHLIN, or Mechelin (Fr. Malines), a city of Belgium, in the province of Antwerp, on the Dyle, 13 m. N. by E. of Brussels; pop. in 1870, 30,090. It is one of the railway centres of Belgium, four lines radiating from the town, which however presents a deserted appearance, vividly contrasting with the bustle at the station, half a mile outside the gates. Mechlin is one of the most picturesque Flemish cities. In the Grande Place are the cathedral and a statue of Margaret of Austria by Geefs. The principal public edifices besides the cathedral are the churches of Notre Dame, of St. Peter and St. Paul, St. John the Baptist, St. John the Evangelist, and an English church; the archiepiscopal palace; the Beguinage, an asylum for aged widows; and the college. There are manufactories of woollens, linens, lace, beer, &c. The lace manufacture, formerly celebrated, has greatly fallen off both in quantity and quality. Mechin is the seat of an archbishop, who is primate of Belgium. Its churches contain some fine paintings by Rubens and Vandyke.

MECHOAACAN. See Micoacan.

MECKLEBURG. I. A S. E. county of Virginia, bordering on North Carolina, bounded N. by the Meherrin river, intersected by the Roanoke, and drained by its tributaries; area, 640 sq. m.; pop. in 1870, 21,318, of whom 14,150 were colored. The surface is undulating and well timbered, and the soil generally fertile. The Roanoke Valley railroad terminates at Clarksville. The chief productions in 1870 were 83,083 bushels of wheat, 243,506 of Indian corn, 123,492 of oats, 11,288 of Irish and 12,513 of sweet potatoes, 2,062,828 lbs. of tobacco, 8,615 of wool, and 1,479,599 of butter. There were 1,479 horses, 787 mules and asses, 2,557 milk cows, 1,081 working oxen, 3,367 other cattle, 5,439 sheep, and 11,108 swine. Capital, Boydton. II. A S. W. county of North Carolina, bordering on South Carolina, bounded W. by the Catawba river; area, about 700 sq. m.; pop. in 1870, 24,599, of whom 10,721 were colored. It has an elevated surface and fertile soil, and contains several gold mines. It is intersected by the Charlotte, Columbia, and Augusta, the Atlantic and Richmond Air Line, and other railroads. The chief productions in 1870 were 62,226 bushels of wheat, 454,864 of Indian corn, 73,990 of oats, 13,159 of Irish and 18,774 of sweet potatoes, 125,939 lbs. of butter, and 6,067 bales of cotton. There were 2,017 horses, 1,922 mules and asses, 3,353
MECKLENBURG

MEDE

milk cows, 4,676 other cattle, 5,403 sheep, and 16,362 swine; 1 distillery, 11 saw mills, and 1 woollen mill. Capital, Charlotte.—The people of Mecklenburg took an early and spirited part in the resistance to Great Britain; and in May, 1775, they publicly renounced allegiance to the crown and adopted a declaration of independence.

MECKLENBURG, a territory of northern Germany, belonging to the German empire, divided into the grand duchies of Mecklenburg-Schwerin and Mecklenburg-Strelitz, bordering on the Baltic sea, Pomerania, Brandenburg, Hanover, Lauenburg, and Lübeck. The house of Mecklenburg is the oldest in Germany. The original inhabitants were of Germanic race, but were conquered during the great migration of nations by Slavic tribes. After long wars against the German monarchs, under the lead of native princes, the country was conquered about 1160 by Henry the Lion of Saxony, who divided it among his nobles, and gave a part of it to Priebias, the descendant of a native dynasty, under the name of the principality of Mecklenburg. The reigning house was subsequently divided into two branches. The elder line was founded by John the Theologian, whose grandson Henry II. (or IV., 1302–29) enriched it by the domain of Stargard. The sons of the latter, Albert and John, were made dukes in 1349; and a great-grandson of Albert became duke of the whole of Mecklenburg. Afterward the country was again divided into two lines, remaining so till 1628, when, on account of a supposed alliance with Denmark, Wallenstein was made ruler of the country. In 1632 the expelled dukes were restored to power by Gustavus Adolphus, and shortly afterward the final division of the country into the two parts took place.—

MECKLENBURG-SCHWERIN has an area of 5,138 sq. m.; pop. in 1872, 557,897, chiefly Lutherans. A ridge of hills traverses the country, but the surface is generally level. It abounds in forests and lakes. Miuritz is the largest lake, and Lake Malchin the most remarkable for its fine scenery. The chief river is the Warnow, which at Rostock expands to a breadth of about 2,500 ft., and falls into the sea at Warnemünde. The soil is fertile and well cultivated. Agriculture is the chief employment of the population. The principal product is wheat. Horned cattle and sheep are numerous, and the horses are celebrated. The number of vessels entering the ports in 1872 was 1,002, tonnage 113,740. The registered shipping comprised 426 vessels, tonnage 142,954. The legislature consists of 622 proprietors of Rittergüter or knights' estates, and 40 representatives of towns. Every two years the diet forms a joint assembly with that of Mecklenburg-Strelitz for common legislation. The public debt in 1872 was estimated at $5,000,000, nearly half of which was caused by loans for the construction of railways. The country is divided into the provinces of Mecklenburg and Wenden, the principality of Schwerin, the city of Rostock, and the lordship of Wismar. It contains 40 towns, the largest of which, and the principal trading port, is Rostock. Schwerin is the capital.—MECKLENBURG-STRELITZ consists of the dominion of Stargard or duchy of Strelitz (area, 909 sq. m.; pop. in 1872, 79,796) on the east and the principality of Ratzeburg (area, 144 sq. m.; pop. in 1872, 17,006) on the west of Mecklenburg-Schwerin. Stargard contains 53 lakes, of which the Tollen lake is the largest. The principal river there is the Havel, and in Ratzeburg the Trave. The government is the same as in Mecklenburg-Schwerin, excepting in Ratzeburg, which is not represented in the legislature. The grand duke is assisted by a cabinet. He is noted for his great wealth. No official accounts of the revenue and expenditure are published. The public debt is estimated at about $1,450,000. Capital, Neustrelitz.—In 1867 both grand duchies joined the North German Confederation, and in 1868 the Zollverein; and in 1871 they became parts of the German empire, toward the foundation of which the grand duke of Mecklenburg-Schwerin had contributed by his services in the Franco-German war. (See FREDERICK FRANCIS II., vol. vii., p. 453.) By a special military convention concluded in 1872, the armies of both grand duchies were incorporated with that of Prussia. As the constitution of the empire guaranteed to every particular state a constitutional form of government, the liberals of Mecklenburg invoked the interference of the German Reichstag in behalf of the abolition of their feudal institutions. In consequence of the resolution passed by the Reichstag, the grand ducal governments submitted drafts of a new constitution to the diet; but in July, 1874, no agreement between the governments and the diet had been arrived at.

MECOSTA, a central county of the S. peninsula of Michigan, watered by the Muskegon and Chippewa rivers; area, 576 sq. m.; pop. in 1870, 5,642. The surface is undulating and the soil productive. It is traversed by the Grand Rapids and Indiana railroad. The chief productions in 1870 were 19,789 bushels of wheat, 17,734 of Indian corn, 27,805 of oats, 53,729 of potatoes, 47,510 lbs. of butter, and 8,176 tons of hay. There were 385 horses, 680 milk cows, 1,085 other cattle, 917 sheep, and 741 swine; 3 flour mills, and 2 saw mills. Capital, Big Rapids.

MEDALS. See NUMISMATICS.

MEDE, or Meade, Joseph, an English theologian, born at Berden, Essex, in October, 1586, died in Cambridge in October, 1638. He graduated at Christ's college, Cambridge, in 1610, and obtained a fellowship. His most esteemed work, Clavis Apocalypistica, appeared in Latin in 1627, and in English in 1643. This was the first rational attempt of an English theologian to explain the Apocalypse. A collective edition of his works was published in London by Dr. Worthington in 1672.
MEDEA, a mythical princess, a daughter of Æetes, king of Colchis, by the oceanid Idia, or Hecate, daughter of Perses. She was famous for her skill in sorcery, and enabled Jason, with whom she had fallen in love, to possess himself of the golden fleece. (See Argoauts.) Medea accompanied her lover to Greece, and lived with him as his wife, but was subsequently deserted by Jason for Creusa, daughter of Creon, king of Corinth. In revenge Medea destroyed her own children by Jason, and sent to Creusa a poisoned garment which burned her to death. Then, fleeing to Athens in a chariot drawn by winged dragons, she there married Ægeus, by whom she had several sons. Having been afterward detected in laying snares for the destruction of Theseus, she was driven to Attica, and went to Asia accompanied by her son Medus, who became the founder of the Median nation. Medea has been made the subject of tragedies both ancient and modern, among which are those of Euripides, Seneca, and Corneille.

MEDFORD, a town of Middlesex co., Massachusetts, at the head of navigation on Mystic river, and on the Boston and Lowell and a branch of the Boston and Maine railroad, 5 m., N. W. of Boston; pop. in 1870, 5,717. It manufactures tin ware, leather, rum, crackers, casks, cabinet ware, harnesses, woollens, cottons, buttons, bricks, carpets, oil silk, boots and shoes, &c., and was formerly noted for ship building. It has a savings bank, public library, reading room, weekly newspaper, 21 schools, besides a high school, and 11 churches, and is the seat of Tufts college. (See Tufts College.)

MEDIUS, Walter Henry, an English missionary, born in London in 1796, died there, Jan. 24, 1857. He was educated for the ministry, and in 1816, under the auspices of the church missionary society, started on a tour through India and Malacca, and resided chiefly in Batavia, Java, from 1822 to 1830. During this interval and for several years afterward he pursued his missionary labors also in Borneo and on the coasts of China. After a residence of two years in England, he settled in 1843 in Shanghai. Subsequently he passed six years in the interior of China, and in 1856 returned in ill health to London. Besides a Chinese version of the Bible, his principal works are: "Chinese Repository" (20 vols., Canton, 1838-51); "Chinese Miscellanies" (3 vols., Shanghai, 1849-53); a "Chinese and English Dictionary" (2 vols., Batavia, 1842-3); and an "English and Chinese Dictionary" (2 vols., Shanghai, 1847-8). His "China, its State and Prospects" (London, 1838), has been a text book for those interested in missionary enterprises in China.

MEDIA (Old Pers. Mada; Heb. Medai), an ancient country of Asia, bounded N. by Armenia, from which it was partly separated by the Araxes (Aras) river, and the Caspian sea, E. by Hyrcania, Parthia, and the desert of Aria, S. by Persia, S. W. by Susiana, and W. by Assyria and Armenia. It thus corresponded nearly to the modern Persian province of Irak-Ajemi. It formed the westernmost part of the table land of Iran, being for the most part fertile, and producing wine, figs, and oranges, and an excellent breed of horses. The most important mountain range in the interior was the Caspian (now Elburz) mountains, the territory between which and the Caspian sea was inhabited by independent tribes. Media was well peopled, originally by Turanian Scyths. In the time of Herodotus, and according to his statement, it was occupied by six tribes, who are said to have been a kindred race to the Persians, that is, a branch of the great Aryan family. In the time of the Persian power they, or at least a large part of them, spoke the same language as the dominant race, and had the same laws, manners, and religion. But there is great difficulty in determining when the supremacy of the Aryan element over the original Turanian or Scythic began, how far the two were blended together, and what relation they occupied to each other during the period of special Median history. According to Ctesias, the Medes revolted from the Assyrians and became independent under Arbaces about 875 B. C.; but his whole story about the fall of that empire and the death of its king Sardanapalus is now discredited. About the same period the Medes first appear in real history, occupying the region S. of the Caspian, when the Assyrian monarch whose expeditions are recorded on the black obelisk in the British museum made the earliest authentic assault on their independence. The list of eight successors to Arbaces on the throne of Media given by Ctesias can find no credit, as his names and dates are at variance with those given by Herodotus. According to the latter, Media, having been for centuries under the sway of the Assyrian monarchs, afforded the first example of a successful revolt to the nations suffering under the same yoke, apparently in the latter half of the 8th century. The people, however, having elected no common chief, suffered greatly from anarchy until Deloeces, a popular judge, secured by stratagem his appointment as ruler of the united state (about 708), by common consent of the Medes, when he founded a fortified capital, Ecbatana. He was succeeded by his son Phraortes, who, says Herodotus, "not being satisfied with a dominion which did not extend beyond the single people of the Medes," attacked and subdued the Persians, and with the united forces of these two nations engaged in war with the Assyrians, but perished with the greater part of his army about 633. The authenticity of this account of the first two Median reigns is rejected by Rawlinson as inconsistent with the monuments; but it seems probable that the principal facts of Herodotus can be reconciled with the monumental history, by supposing his Deloeces and Phraortes to have been either half independent viceroycies of the Assyrian monarchs, or rulers.
in parts of Media which succeeded in conquer-
ing and maintaining their independence. Ac-
cording to Rawlinson, the Median kingdom
was probably first established about 688 by
Cyaxares, the third king of Herodotus. At all
events, it was probably that monarch, generally
regarded by Greeks and Asians as the founder
of a dynasty, who made the Aryan element
paramount in the kingdom, after a hard strug-
gle between native and foreign Turanian tribes.
The Aryan emigration from the east had for
centuries been pressing upon the Turanian
populations of the regions E. and S. of the
Caspian, and under Cyaxares a violent strug-
gle of the two races was after many years de-
cided in favor of the former. This struggle
Herodotus brings in connection with the invasion
of Asia by the Cimmerians, relating that the
Scythians, their pursuers, interrupted the suc-
cesses of Cyaxares, the conqueror of Nineveh
in alliance with Babylon, and spread the ter-
or of their arms as far as the confines of
Egypt, holding sway over Asia for 28 years.
A treacherous massacre is said to have termina-
ted this sway, when Media, which under Cyax-
ares also waged war against Alyattes of Lydia,
became the first among the nations of Asia,
another empire being simultaneously founded
by its Babylonian ally. The reign of Asty-
ages, the son of Cyaxares, which lasted 35
years, was peaceful, but ended (about 558) with
a catastrophe, which changed the united king-
dom of "Media and Persia," as it is called in
Scripture, into another styled Persia and
Media, in which the people of the conqueror,
Cyrus, became the predominant race. The
difficulty, however, which arises from the fact
of a Darius the Mede being represented in the
book of Daniel as king of Babylon, has induced
some critics to accept the relation of Xeno-
phon, strengthened by that of Josephus, con-
cerning the reign of a Cyaxares II., son and
successor of Astyages, for whom Cyrus, his
nephew, conquered Babylon, in preference to
the detailed story of Herodotus; while others
find Darius the Mede, not in a Cyaxares II.,
but in Astyages, who may have maintained a
shadow of royalty under his grandson, Cyrus.
(See DARIUS.) Both Media as a province, and
its undoubtedly mixed population, continued
prominent in the history of the new Aryan
empire, though two great struggles for the re-
cover of independence, under Darius Hystas-
pis and Darius Nothus, failed. Many of the
highest offices in the state were held by Medes;
and the Scythic inscriptions on the Persian
monuments prove the importance which was
attached to the populations of the ancient Me-
dian provinces. The relation of the influen-
tial caste of the Magi to the Median tribe of the
same name, as well as of the Scythic element
of the Medo-Persian religion to the Aryan, is
not yet satisfactorily cleared up. The Median
religion appears to have been Magism, while
that of the Persians was Mazdaism. Desirous
of conciliating the religious notions of the Tu-
ranian people who formed a large element in the
population of Media, the Magi, the great ones,
or priests, combined the worship of Ormuzd
with that of Ahriman, whom they identified
with the Turanian Afrasiab. (See Ommez, and
Zoroaster.) Semitic races formed also
a constituent part of the population of Me-
dia, and hence the Magi introduced also the
worship of the gods of Assyria and Elam. It
seems that the Magi practised sorcery and
incantations, which pure Zoroastrianism ex-
pressly forbids. Otherwise but little is known
of the state of Median civilization, arts, and
religion. Median architecture, according to
Rawlinson, appears to have possessed a bar-
baric magnificence, but not much of either
grandeur or beauty.—After the Macedonian
conquest, and the death of Alexander, a gov-
ernor of the latter, Atropates, made himself
independent in the N. W. part of Media, hence
called Atropatene, which continued to exist
as a kingdom down to the time of Augustus,
while Great Media was under the successive
rule of the Seleucids and Parthians. Both
parts of ancient Media were again united un-
der the Neo-Persian kings, and its subsequent
history is blended with that of Persia.—See
George Rawlinson, "The Five Great Monar-
chies of the Ancient Eastern World" (London,
1862-'8); Lenormant, Manuel d'histoire anci-
enne de l'Orient (Paris, 1868-'9); Spiegel, Er-
stände alter Alterthums (Leipsic, 1871-
'8); and Duncker, Geschichte des Alterthums
(4th ed., Leipsic, 1874 et seq.).

MEdICAL ELECTRICITY, or Electro-Therapeu-
tics, the therapeutical application of the various
kinds of electricity. The attempt to employ
electricity in medicine dates as far back as the
knowledge of the phenomena of electricity it-
self. The history of electro-therapeutics may
be divided into four periods: 1, the period
before the invention of the electrical machine
and Leyden jar; 2, from the invention of this
machine to the discovery of galvanism; 3,
from the discovery of galvanism to that of
magneto-electricity; 4, from this last discov-
ery to the present time. Of the first period
little is known. The ancients occasionally ate
of the raja torpedo on account of its supposed
curative properties, and 1,000 years ago the
women of western Africa are said to have
placed their sick children in pools of water
containing these fish. Scribonius Largus, a
physician of the time of the emperor Tiberius,
employed electric fishes for the cure of gout,
and Pliny and Dioscorides speak of electricity
as a therapeutical agent in several diseases.
It was not till about the middle of the 18th
century, or a century and a half after the
observations of Dr. Gilbert of Colchester in
England, that much was done in the way of
applying frictional electricity in electro-thera-
peutics. About this time a German named
Kratzenstein is said to have restored the use of
a paralyzed finger by electricity, and ex-
periments were made in the Vienna hospital un-
der
the direction of De Haen with considerable success. In France Jallabert, Sigaud-Lafond, Bertholon, and others became enthusiastic advocates of its application; and especially Mauduyt, who made a favorable report to the royal society of medicine in 1778. The agent was employed in every form then attainable—in baths, in electric jets and streams, and in shocks. Cavallo, in his "Essay on the Theory and Practice of Medical Electricity" (London, 1780), collected all the various ideas of his day on the subject, by which it was credited with being of service in paralysis of the muscles, impaired vision and hearing, chorea, epilepsy, chronic rheumatism, serofulous enlargement of the glands, and in reanimating the apparently dead. The natural magnet had been used by Paracelsus, and its mysterious properties were greatly extolled by him; and the use of artificial magnets by Maximilian Hell of Vienna drew considerable attention to this form of electricity as a curative agent. But the magnet, unless employed to induce electric currents, is almost inert for this purpose, and consequently practical men could never from this, or from frictional electricity alone, derive that degree of benefit commensurate with the inseparable disadvantages from delay, exposure of person, etc., attending their use. The discoveries of Galvani and Volta gave a new electric force, and the controversy between their followers revived the interest of the medical profession and physicians generally in electro-therapeutics. In 1797 Humboldt published his celebrated work, Ueber die gerechte Muskel- und Nervenfaser, in which the power of galvanism to change the secretions was shown, as also the dependence of nervous sensibility upon external circumstances, such as muscular exertion and diseased condition. The book exerted a profound influence, not only upon the development of the science of medical electricity, but upon the progress of physiology. The rectification of persons inanimate from suffocation or nervous derangement attracted about this time much attention, and Hufeland and Sommering made a series of experiments with special reference to this subject, arriving at the conclusion that the phrenic nerve offered the best pathway to the galvanic current for restoring suspended animation. Pfaff, Reil, Humboldt, and others also recommended galvanism as an efficacious agent in cases of paralysis of certain organs, and Valli proposed it as a test in cases of apparent death. The introduction of Volta's pile in 1799, by which the intensity of the galvanic current was greatly augmented, gave an additional advantage, as by it penetration into deeper parts of the body was possible. Loder, Bischoff, Lichtenstein, Hers, and others directed their attention to its application in cases of paralysis of the extremities and nerves of special sense. At the same time Prof. Schaub in Cassel, and Eschke, director of the institution for the deaf and dumb in Berlin, employed it in cases of impaired hearing and of deaf mutes. But owing to the frequent failures of electricity to realize the hopes of its friends, the great body of scientific physicians were slow to recognize it as a trustworthy therapeutic agent, and it fell into the hands of charlatans, who offered the voltaic pile for sale as a panacea. The circumstance that mesmerism, which had made its appearance some time before, was connected in the public mind with electricity and magnetism, had the effect of discouraging practitioners from making investigations in that direction. Faraday's discovery of inductive electricity in 1831 was the commencement of a new era in the history of medical electricity. The construction of magneto-electric machines by Saxton, Keil, Ettinghausen, and Stöhr offered facilities for the use of electricity in medicine not before known; but these machines were costly, and Wagner, Rauch, Duchenne, and Du Bois-Reymond made cheaper voltaic apparatus of considerable intensity; and physicians and scientific men generally employed much of their time in making experiments. Among the English who engaged in this pursuit were Marshall Hall, Golding Bird, Stokes, Phillips, Graves, and Donovan; among the French, Poiseuille, Pétrequin, Masson, Duchenne, and A. Becquerel; and among the Germans, Weber, Heidenreich, Richter, and his Meyers, to name Erdmann, Baierlacher, Eekhardt, Remak, Althaus, and Rosenthal. Pravaz was the first to conceive the idea of curing aneurism by galvanopuncture; the English surgeon Liston was the first to apply the method to the human subject; the Italian Cinisiili was the first to make a successful operation.—The manner of applying electricity in therapeutics has been various, and at present differs in different cases. The earliest method of using the frictional electricity of the ordinary machine was to take the sparks from the prime conductor, soon after its contact with the patient, and to make them fall from the patient, who was placed upon an insulated stool. On the introduction of the Leyden jar, shocks were taken from this apparatus, but no great degree of system in its application was ever attained. The most remarkable and practical successes of electricity have perhaps been in the domain of surgery, by the employment of electric currents of sufficient quantity to raise platinum wire to a white heat. This mode of employment cannot be strictly called therapeutic, as the action is simply one of heat, and possesses no intrinsic properties beyond those of the actual curation. But it is applied in situations where it would be impossible to apply the same degree of heat produced in any other manner. Galvano-causity, as this operation is called, is employed for extirpating and abolishing tumors and diseased growths. A battery of from 16 to 24 of Grove's cells, or an equivalent battery of any form, is all that is required to produce the current. (See Galvanism.) Electrodes of
platinum wire of different thicknesses, and of various forms and lengths, to meet the requirements of different cases, are connected with portable conducting wires in such a manner as to admit of the most convenient application. In electro-therapeutics two forms of current are used: the direct battery current, and the induced, electro-magnetic, magneto-electric, or faradic currents. (See Electro-Magnetism, and Magneto-Electricity.) When the direct current is employed, the operation is called simply galvanization; when the induced or interrupted current is used, the process is called faradization. The direct current may be used of such strength and so applied as to produce decomposition of the fluids and solids of the parts to which it is applied, an operation which has received the name of electrolysis. Needles of various forms and sizes are employed as electrodes. They are inserted into the diseased parts, and the therapeutical results are dependent in a great measure upon the fact that diseased parts are more readily destroyed by electrolytic action than sound parts. Batteries for electrolytic purposes should be coupled for intensity, as quantity arrangement produces too much heat, and has not sufficient intensity to overcome resistance. The general effects of electricity upon the various parts of the body are as follows: When a current from 12 or 16 Grove's elements is passed through the brain, by placing one electrode upon some part of the cranium, which should be slightly moistened, and the other upon some other part of the body, as along the spinal column, or in the hands or under the feet, flashes of light appear upon breaking the current, and a metallic taste is perceived. M. Erb has demonstrated that the skull offers no obstruction to the passage of the current. Galvanization of particular parts of the brain will excite contractions of the muscles. Matteucci showed that electric stimulation of the crura cerebri is followed by muscular contractions; but the most marked effects of electricity are upon the special senses. If a metallic plate connected with one electrode is placed upon the forehead and the other over the infra-orbital nerve, it will cause the sensation of a vivid flash of light. Galvanic stimulation of that part of the sympathetic system supplying the iris will produce dilatation of the pupil. The sense of hearing is also intensified, and favorable results have been obtained by repeated applications of the continuous current through the parts containing the different portions of the ear. The olfactory nerve is not affected by the induced or faradic current, but a moderately strong continuous current will produce a peculiar odor, which is not to be confounded with that of ozone, afforded by the friction machine. The sense of taste is easily affected by the galvanic current. A simple experiment consists in placing a plate of zinc beneath the tongue and a plate of a more negative metal, as copper or silver, above it, and bringing the edges of the two together, when a flash of light and a metallic taste will be perceived. Electroization of the motor nerves results in a contraction of the muscles which are supplied by them, which occurs upon the closing of the circuit, ceasing when the current is broken. The effect is greatest when the negative electrode is applied to the nerve and the positive to the muscle. Ritter found that when the current was applied in the direction of the nerve its excitability was diminished, but in the other direction the irritability was increased. If the electrodes are applied to the surface of the body, a sense of warmth will be felt in the part. A strong current will produce a sense of prickling or tingling, which may increase to a state of extreme pain. With the interrupted or faradic current, if the breaks are made slowly, the sensation will differ from that which occurs when they are very rapid; and this will vary with the part operated upon, and with the variety of electrode employed. A moist sponge may occasion only a slight disturbance; but a bundle of pointed wires may create an intense sensation. The amount and distributions of the nerves beneath the skin will also be followed by a difference of sensation. Remak holds that the nearer the nerves are to the brain the greater will be the excitability. The application of the continuous current for any great length of time will diminish sensibility. Faradization and static electricity have but little influence upon the sympathetic system of nerves; but the continuous current from a battery of many couples may be passed through many parts of it. When the cervical portion is electrically insulated, dilatation followed by contraction of the pupils occurs, the pulsations of the heart are less frequent, and the tension of the arterial walls is diminished. That the vaso-motor system of nerves may be decidedly affected appears from the fact that galvanization excites the peristaltic action of the intestines, and greatly affects the calibre of the capillaries and larger blood vessels. The stomach and intestines and other abdominal organs are readily influenced by applying the electrodes at either side of the abdomen, or by applying one electrode over the abdomen and the other along the spinal column. The continuous current sent through the splanchic nerves increases the peristaltic movements of the intestines, while faradization diminishes them. The details of the practice of electro-therapeutics, especially from the fact that changes are liable to be made, are purposely omitted in this work.—See "Electricity in its Relations to Practical Medicine," by Dr. Moritz Meyer, translated and edited by W. A. Hammond, M. D. (New York, 1869); "A practical Treatise on the Medical and Surgical Uses of Electricity," by George M. Beard, M. D., and A. D. Rockwell, M. D. (New York, 1871); "Clinical Electro-Therapeutics," by Al-
MEDICAL JURISPRUDENCE, called also legal or forensic medicine, the employment of the principles of medical science in the administration of law. In its relations to jurisprudence, medical learning is a branch of evidence in which the physician or surgeon is called in as an expert. There are traces both in the Jewish and Roman systems of the recognition of medical science in the application of laws; but forensic medicine cannot be said to have attained the dignity of a science until many centuries after the completion of the Justinian code, certainly not until anatomy was studied in the human subject in the 14th century; perhaps not before the publication of the Carolina criminal code in 1552. The Roman law had referred all medical questions which arose in legal processes to "the authority of the learned Hippocrates." The code of Charles V. enjoined the magistrate, in all cases of doubt respecting asserted pregnancy, infanticide, the means of homicide, and in other cases of death by violence, to consult the opinions of medical men. During the latter part of the 16th century and the earlier part of the 17th, legal medicine made marked progress. Ambroise Paré published during that time a treatise upon tardy births. Fortunatus Fidelis compiled and published at Palermo in 1602 all that was then known of medical science. At Rome, about 20 years later, Paolo Bacchia, or, as he is usually called, Paulus Bacchias, commenced the publication of his *Questiones Medico-Legales*. This work appeared in successive volumes between the years 1621 and 1650, and deserves the merit of first worthily exhibiting legal medicine as a science. In France in 1609, under a patent of Henry IV., two surgeons were appointed in every considerable town to make examinations and reports in all cases of wounded or murdered persons. The application of the so-called hydrostatic test of Galen to cases of supposed infanticide, which had been suggested by Harvey, was discussed in several disquisitions by Bartholin (1663), Swammerdam (1677), Jan Schreyer (1682), and toward the close of the century by Bohm, in his *Treatise De Renunciatiione Valerum*. In a later work Bohm treated of the office of the physician as expert in judicial tribunals. France produced during this time no very celebrated works on forensic medicine, but the *Doctrine des rapports en chirurgie de Blény* (1684), and the more useful book of Devaux on the same subject, are honorably mentioned in this branch of the science. In 1722 Valenti contributed to the literature of the science the *Pandectae Medico-Legales*. Between 1725 and 1747 were issued at Halle the successive volumes of the *Systema Jurisprudential Medicis* of Albertini. This work was followed by the *Institutiones Medicinae Legalis et Forensis* of Tischmeyer, which was used for a long time as a handbook in the German universities, and formed the text of Haller's lectures, which were published after his death in 1782 and 1784. The *Elementa de Plenc (*1781) and the *Systema de Metzger* (1795) are commended by writers of high authority. So too is the collection of Metzger's constitutions or opinions, many of which embody the results of his studies in mental disease as a branch of legal medicine. The *Collectio Opusculorum*, edited by Schlegel, and embracing upward of 40 dissertations by German authors on various topics, was one of the most valuable additions made during the 18th century to the learning of the science. In the latter part of the 18th century, infanticide was made the subject of elaborate research by Daniel and Plouquet, among others, the latter of whom published an essay upon the evidences of respiration in new-born infants; and by Metzger, Portal, and Camper, of whom the last wrote upon the signs of life and birth in new-born infants, and upon the causes of infanticide. During the same period the eminent French surgeon Antoine Louis, both by private dissertations and by his opinions pronounced before the tribunals, contributed to the illustration of some of the most difficult topics in legal medicine. Among the former are his memoirs upon tardy births, on the certain signs of death, on drowning, and on the mode of distinguishing between suicide and assassination in the case of a body found hanged. But his opinions, many of which are collected in the *Causae célèbres*, present perhaps the clearest evidences of his genius. A valuable memoir upon death from blows or wounds was read by Chaussier at Dijon in 1789, and the next year he delivered there a course of lectures upon legal medicine. Shortly before the close of the century Fodéré published *Les lois éclairées par les sciences physiques*, ou *traité de médecine légale et d'hygiène publique*. This treatise displays the entire system of the science. Dr. Parr published in England in 1788 the "Elements of Medical Jurisprudence." This book was a mere compilation from continental authorities, but was at the time the only English work upon the subject. In the first year of the present century, the first lectures in Great Britain upon medical jurisprudence were delivered at Edinburgh by Dr. Andrew Duncan, and in 1805 the first professorship was established in the same city, and conferred upon Dr. Andrew Duncan the younger. The most important accessions to the science of legal medicine in recent times are those derived from studies of mental disease, and the application of the knowledge thus obtained to determining questions of legal responsibility; and from investigations into the nature and effect of poisons, and the mode of detecting their presence in the human body. The first systematic work of this century is the posthumous one of Dr. Mahon (1807), professor of legal medicine at Paris. In 1808 Marc pub-
lished a translation of the German work of Rose on medico-legal dissection, to which he added valuable original notes and essays. Fro- dér in 1813 issued a second and much enlarg-
ed edition of his treatise. Of a far higher character than any work which had preceded it was the *Toxicologie générale* of Orfila, which appeared in 1815-14, and was followed some years later by his *Légons de médecine légale*. Orfila rendered the most eminent services to the science, and particularly in the department of toxicology. The elaborate treatise of Devergie made still further advances alike in the theory and practice of legal medicine. Briand, Capuron, Bissy, Esquirol, and Marc are authors of learned treatises or of dissertations on single subjects. But any sketch of the French literature upon this subject would be incomplete without mention in the *Archives d'Hygiène publique et de Médecine légale*, a quarterly journal, which from its first appearance in 1829 to the present time has been sup-
ported by the ablest medical men of France, and is an invaluable repository of information on the various branches of medical jurispru-
dence. The Germans still maintain their high rank in this science. Schmidtmüller, Wildberg, Gmelin, Remer, Bernt, Henke, and many others have made the most various and valuable addi-
tions to the learning of medical science and jurisprudence. The principal Italian authors of the present century are Tortosa, Martini, and Barzelotti. In 1818 Dr. Male produced the first respectable English work on forensic medicine. More comprehensive and better in many respects than any which had preceded it, was the treatise of Dr. John Gordon Smith (1821). Two years after appeared the more formal and elaborate work, the result of the combined labors of a lawyer and a physician, Meera, Paris and Fonblanche, Dr. Chris-
tison's works on poisons are of the best ex-
cellence. Haslam on insanity, Hutchison on infanticide, Watson on homicide, Gavan on feigned diseases, Taylor, Guy, and Traill, are authors of high eminence in their various spe-
cialties. Lectures upon medical jurisprudence were first delivered in America in 1804 at Columbia college, by Dr. James S. Stringham. In 1815 Dr. T. Romeyn Beck was appointed to lecture on the science in the western medical college, and not long after Dr. Walter Channing received a similar appointment in Harvard col-
lege. American authors have furnished some of the very best works upon this science. The well known work of Dr. Beck (12th ed., 1863) was pronounced by Dr. Traill of Edinburgh the best book on the general subject in the English language. American editions of var-
ious English works, and the publication of the excellent treatises of Wharton and Stillé, of Dr. Ray's book on insanity, of Elwell on mal-
pRACTICE OF THE "AMERICAN JOURNAL OF IN-
SANITY," and the "JOURNAL OF PSYCHOLOGICAL MEDICINE," maintain the high reputation of our country in its culture of medical science and jurisprudence.—The very general survey of legal medicine which is here proposed will ex-
clude all notice of medical police or public hygene, and will be exclusively limited to a brief review of the more prominent branches of the science. Following the division of Briand, the subject may be conveniently ar-
 ranged under three heads: the first embracing those branches which concern the reproduction of the species; the second considering injuries to health and life, the different forms of death by asphyxia, and the nature and effect of poisons; and the third examining mental af-
flections.—In the male, absolute and incurable impotence may arise from total absence, un-
natural form, or paralysis of the organs of generation. Curable conditions may be the con-
sequence of disease or senusal excesses, or of slight malformation which can be corrected by surgery. Accidental and temporary incapacity may be caused by nervous or malignant fevers, particularly if they affect the brain and are accompanied by great debility, all affections of the head and spinal marrow, palsy, apoplexy, and the like diseases. This class of causes usu-
ally comes to be considered upon questions of contested paternity; for if it appear that any of these existed at the time of the child's con-
ception, the presumption is strong against its legitimacy. In the female, malformation may render intercourse impossible. If it existed at the solemnization of the marriage and be in-
curable, it is sufficient ground for divorce. Fe-
male impotence may also be caused by diseases which may yield to medical treatment. In two instances familiar to the theory of the com-
mon law, though rare perhaps in its administra-
tion, medical testimony may be invoked by the courts upon the question of pregnancy: first, where a widow is thought to feign herself preg-
nant in order to supply a suppositional heir to an estate; and secondly, where a fema le de-
signed to be in that condition, for her execution will be delayed if she be quick with child. But in other respects, and particularly in relation to abortion and in-
fanticide, the existence of pregnancy may be a significant fact. In respect to the crimes of abortion and infanticide, and also with refer-
ce to civil cases, when questions of heirship are involved, it is important to consider the signs of a child's death before or during deliv-
er. From the sound health of the woman and the usual signs of a healthy pregnancy, nothing can be conclusively presumed respecting the life of the fetus; and on the other hand, though violence and those other causes which tend to produce miscarriage may and usually do destroy the fetus, yet infants sometimes survive all these. The signs of death during pregnancy are numerous, and yet equiv-
ocal. Auscultation is one of the surest means of detecting fetal life. After the birth, the physician can judge from the appearance of the body, from the condition of the flesh, from its color, from the condition of the umbilical
cord, and of the bones, whether the infant was dead or alive at delivery. The successive stages of foetal life, as they are marked by the size, weight, and development of the organs and functions of the child, will throw much light upon the matter in question. In its latest researches science has found that the changes in the brain furnish an index of the general development. Yet all inferences derived from the structure and dimensions of the foetus will be modified and controlled by considering the age and vigor of the mother, her mode of life, and perhaps the climate in which she lives. All systems of law contain provisions respecting newly born infants. To succeed to property, according to the Roman law, the infant must be perfectly alive. The English law makes a like requirement. By the French civil code the child must be viable, or capable of life, in order to be capable of inheriting; and on the authority of the most eminent surgeons and jurists of France, life, or being born alive, means complete and perfect respiration. The viability of a child, that is, its capacity of life, comes then to be considered in questions of property, and of the division of inheritances; for a child which is declared by medical science to have been viable may be presumed to have lived, and so to have inherited.

"It is now very generally conceded," says Beck, "that no infant can be born viable until 150 days, or five months, after conception. The instances of exception to this rule are questionable; indeed, the survival of infants born at six, seven, or even eight months after conception, is by no means frequent." The criminal destruction of the foetus while still in the womb, generally described by its consequences as abortion, is more fitly named facticiēde. (See Abortion.) The duty of the medical expert in cases of supposed facticiēde is to determine whether the substance expelled from the womb be really the product of conception, and whether the causes of miscarriage were natural or artificial.—Facticiēde is the murder of a child born alive. Here the medical examiner must address his inquiries first to the appearance of the body in order to determine whether it was born alive. If that be clear, he will seek to determine how long it lived, and the means by which it came to its death. These inquiries will naturally involve an examination of the alleged mother. Proof that life has existed in the child may be derived from the effects of respiration upon some of the organs of the body. In a child which has breathed completely and fully, the thorax will be found expanded and the diaphragm more or less depressed by the inflation of the lungs; but these signs alone are not of much value. Respiration will also have distended the lungs and increased their volume, and will have changed their color from the brownish tint of the foetal lungs to a pale red or scarlet color. After respiration the lungs become soft and spongy, and they crepitate more or less upon pressure. The hydrostatic test is often applied. Galen had taught that by inspiration the lungs are rendered specifically lighter, and in modern times the test was first applied by Schreyer in 1682 to cases of suspected child murder. In the course of experiments it has been found that the lungs may float from other causes than respiration, as for example from putrefaction and the artificial introduction of air. But, observing certain precautions, it may be certainly known to what cause the buoyancy is due. If, says Beck, with such precautions it be found that the lungs float in the water, as well with the heart attached to them as separate from them, and if when cut into pieces each fragment floats, then the proof is strong that the infant enjoyed perfect respiration. Something may also be concluded, though not with much certainty, from the character of the blood found in the body, but more from the changes in the blood-circulating organs which are known to be wrought by the establishment of respiration, as, for instance, in some of the vessels and ducts of the heart, and in the arteries and veins of the umbilical cord. The separation of this cord, in the living child, is preceded by several stages of desiccation; and if this characteristic be present, its condition will afford evidence of the infant's age. To the validity of these indicia, so far as they tend to show the fact of life, it has been objected that the child may have breathed during delivery, and yet have died before it was fully born. It is replied to this, that the fact of breathing during birth affords the best presumptive evidence that the infant was born alive, and that the marks of any accidental cause of death will generally be discovered on inspection. More than that, respiration in such cases is commonly imperfect, and the objection will therefore have but little weight where the body presents the appearances which are induced by complete respiration. If the examination lead to the conclusion that the child was born alive, the means of death must next be determined, and whether they were innocent or criminal. The omission to tie the umbilical cord, permitting fatal hemorrhage by its severed vessels, may be a cause of death. In such a case the body presents externally a singular paleness, and a peculiar waxy appearance. Internally is observed a loss of color in the muscles and viscera, and absence of the usual quantity of blood in the heart and blood vessels. Exposure to cold immediately after birth, want of proper nourishment, the inflection of blows and wounds, the thrusting sharp instruments into various parts of the body, are frequent modes of child murder. In cases of strangulation, suffocation, and poisoning, the indications of the cause of death are evident, and are suggested under the proper divisions of this article. It must be remembered also that accidental causes attendant upon birth, congenital disease, malformations or defects of internal structure, may deprive the child of life
or render it incapable of living. The mother may have been overtaken by the pains of labor when alone and unassisted, and then there are many chances against the safe delivery of the infant. Fainting or convulsions, which sometimes attend labor, may render her incapable of ministering to the first wants of her child; unskilful and imperfect ligature of the umbilical cord may produce death. An examination of the supposed mother has already been suggested.—In determining questions of legitimacy, the consideration of premature and tardy births necessarily arises. The ordinary period of gestation, derived from accurate data, is fixed at ten lunar months, or 280 days. It is admitted on high authority that this time may be exceeded, but it has been suggested that the apparently exceptional cases may be explained by the fact of inaccurate computation. Still it is to be remembered that the human fetus is ordinarily expelled only when it has attained sufficient development, and that, as this may be delayed by disease or other causes, it is not strange that delivery may be for a longer or shorter time deferred. Whether a child born before the time expected is to be regarded as legitimate, has been already incidentally discussed. It has been seen that the best authorities deny that a perfectly natural child can be born in less than seven months after conception. The absence or incapacity of the husband during this period, and all other causes which render intercourse impossible, tend strongly to prove illegitimacy of the child. Births occurring at 13 and even 14 months after an alleged coition have been sometimes claimed to be legitimate. This topic of protracted gestation has been abundantly discussed by medical writers. It must suffice here to say that, though the theory seems to be ably opposed by many, it is yet favored by a majority of the authorities, among whom are included Bacchias, Haller, Petit, Fédéré, Capron, Orfila, and others of almost equal eminence. It may be added that, of the cases cited in support of this theory, the best authenticated are those in which the ordinary period of gestation was transferred only by three or four weeks.—When a person is found dead under circumstances which render the cause of death doubtful, the medical expert may be called upon for an opinion whether death resulted from natural causes, or from violence; and, if by violence, whether that was self-inflicted or by the hands of an assassin. Under this division of our subject we shall notice some of the more usual and characteristic phenomena observed in cases of death by blows and wounds; by asphyxia, considering here drowning, hanging, and suffocation; and finally, by poisons. The appearances in the body which are caused by effusions of blood will attract the early attention of the examiner. When a blow or contusion is sufficiently violent to rupture blood vessels, the effused blood spreads into the cellular tissues and forms ecchymosis. The intensity and grad-

uation of color in these spots give clear indications of their cause, and the freedom of the hemorrhage shows that they were produced during life. Ecchymosis is named traumatic when, as is usually the case, it proceeds from external causes, and spontaneous when it is the effect of internal violence. From this must be distinguished the post-mortem appearances caused by sanguination. This is the term applied to the determination of the blood, merely as an effect of gravitation, into the lower lying portions of the dead body; and into the capillary blood vessels, and not into the cellular tissue. Ecchymosis may be imitated on the dead body within a short time after life is extinct; but very violent blows inflicted then will produce only the same effect as slight contusions during life. The body may plainly show, or dissection may disclose, that death was caused by wounds, that is to say, in the language of legal medicine, by a lesion of any part of the body. It may be remarked in passing that, in law, a wound means a breaking of the skin, at least, by the application of extreme violence. A division of the cuticle alone is not sufficient. The true skin must be penetrated, though there be no effusion of blood. In surgery, a wound means a solution of continuity, or disruption, in the fleshy parts. The first inquiries of course will be whether the wounds discovered were self-inflicted, or resulted from accident, or were given by a homicide. The position and direction of the injuries will be noted. The presence of many wounds argues violence by another hand than that of the deceased. The suicide generally directs the hurt to a single vital point. A wound made by a cylindrical and pointed instrument has distinct angles. A cut is larger than the cutting edge, and in the living body is always accompanied by some effusion of blood. A wound by a perforating instrument is generally smaller than the instrument which inflicted it. The entrance made by a ball is distinguished by the regular roundness and depression of its edges; the exit wound is torn and ragged. The former is also larger than the latter. The spiral motion of a rifle ball causes a more ragged wound than that of a ball from a smooth-bored arm. A single round wound can be produced by a shot charge only when it is fired at a distance of 10 or 12 inches, and then the injury is not the same as that of a ball, but is more extensive and more serious. The examination of spots supposed to be made by blood may lead to important discoveries. Blood washed from linen into water imparts to it a deep red color; boiling produces a muddy brown precipitate which is to be subjected to chemical tests. In fresh blood the microscope reveals the presence of red flattened disks, which are the blood disks, and among these, more rarely, the rounded colorless lymph globules. These latter may still be observed under the microscope in the water in which dried blood has been softened; the blood disks are less easily obtained. It is often a
question for the medical expert, when disease has succeeded to the injury, whether death resulted from the one cause or the other. If malignant or inflammatory symptoms follow upon slight wounds, the inference is ordinarily not difficult that the injury was not the cause of death. The habitual use of intoxicating liquors tends to induce a diseased condition of the system, and in a state of actual drunkenness the vessels of the body are in that condition in which an external injury is apt to produce rupture, and a less violent blow will cause it than would otherwise be required. Legal responsibility rests on the clear and direct consequences of the injury inflicted. This principle must always be borne in mind. For disease, though developed in organs far from the seat of the wound, may yet be its immediate result; as, for example, injuries on the head may promote a deposition of pus in the lungs, or give rise to abscesses of the liver; and on the other hand, death may result from improper medical treatment, or from the negligence or excesses of the injured party himself. (For the subject of malpractice, see Surgery.) Though external marks fail, the skilful anatomist may discover upon dissection internal signs of mortal injuries. Blows or wounds upon the surface of the body may possibly rupture the heart. Ruptures of aneurisms may be produced by the excitement of passion, and laceration of the spleen or liver by a fall or other sudden external violence. Death from starvation is characterized by distinctive phenomena. The body is extremely emaciated, and, even though death were recent, exhalas an acrid and fetid odor; the eyes are red and open, the tongue and throat dry, the stomach and intestines empty, and the gall bladder distended with bile; the blood vessels and internal organs are comparatively destitute of blood.—When life has been destroyed by the inhalation of noxious vapors, as for instance of carbolic acid or sulphured hydrogen gas, the head and face are found to be swollen, the eyes protruded, and the tongue fixed between the teeth. The face, if observed soon after death, may be pale, but generally soon becomes livid. The blood vessels of the head and lungs and the right vessels of the heart are filled with dark fluid blood. Pure carbonic acid gas is irrespirable, and inhalation of it causes death rather by asphyxia than by poisoning. When mixed with atmospheric air, 20 per cent. of this gas is very promptly fatal to life, and even a smaller proportion may produce the same result. Death from asphyxia is caused in various ways. When respiration is checked by mechanical compression of the organs which perform that function, or when it ceases either from want of air, as in cases of suffocation and strangulation, or from failure of vital air, and the inspiration of mephitic or deleterious gases, death is caused by asphyxia. Properly speaking, death ensues in those cases from non-occlusion of the blood. It is preceded and accompanied by marked phenomena, more marked and evident in proportion to the rapidity with which death advances. In a violent struggle for breath, the eyes become distended, the veins swollen, and the face is fully suffused. On dissection, the pulmonary vessels and the right auricle and ventricle of the heart are found charged with blood, the liver, spleen, and kidneys are gorged, and the lungs expanded. In cases of less violent death, where, for example, it is brought about by inhalation of noxious gases, these appearances are less strongly marked.—Hanging sometimes causes death by producing congestive apoplexy, the pressure of the cord preventing the return of blood from the brain, while it does not check the circulation by the intervertebrals; but more frequently the destruction of life is due to asphyxia. Luxation or fracture of the cervical vertebrae speedily causes death. The signs of strangulation are a livid depressed circle upon the neck, made by the cord; the face is distorted; the eyes are open and protruded; the face, shoulders, and chest swollen. The ecchymosis produced by the cord is an important sign, for, as has been already observed, ecchymosis is possible only when contusion of the tissues takes place in the living body; yet in inferring the mode of death it is to be remembered that as death in hanging may suddenly result from luxation, the cord may have had no time to act on living tissues. The condition of the genital organs also affords very important proof of death by hanging. The color of the countenance is also to be regarded. If the trachea or larynx was alone compressed, the face is pale; but when the veins of the neck were pressed, as by the cord, and the heart continues its action for some time, the blood is propelled into the head and causes suffusion of the face. The question may arise whether, if the deceased came to his death by hanging, it was his own work, or the work of a homicide. An examination of cases of suicide has shown in a large proportion of them the absence of ecchymosis; and this because from the employment of less violence the contusion of the neck was less. Fracture of the vertebrae of the neck is often caused in execution by the fall of the body or even by force which is sometimes applied by the hangman. But luxation is of course not conclusive evidence of homicide. An examination of the position of the body and of the objects which surround it, of its elevation above any possible support, and any marks which show resistance, must be made in all suspected cases. In strangulation, in its ordinary sense, death results not from fracture of the vertebrae, but from interruption of respiration. This is a rare mode of suicide, and when appearances indicate that it was the means of death they raise a violent presumption of assassination. Because death ensues from interruption of the breath, the mark of the cord must be quite distinct, and is
rath easier the oblique. Bruises of peculiar form around the neck may show that strangulation was effected by the hands. It is impossible that these should have been made by the suicide, because the hands lose their power as insensibility advances. But in cases of hysteria, apoplexy, or epilepsy, the sufferer may in his agony have pressed the hands to the throat, and in this way have made the marks which give rise to a suspicion of murder. Obvious and distinctive marks are, says Dr. Chris- toson, rarely present in a case of death by suf- focation. They are the less evident as death is the more rapidly induced; for if there be no time for the accumulation of blood in the ve- nous system, there will be no enlargement of the pulmonary vessels, no turgescence of the veins, and no discoloration of the skin. In the cases which occurred in the Champ de Mars in Paris in 1847, of suffocation by pressure in the crowd, when death was probably caused by asphyxiation being incomplete, and was long de- ferred, the bodies of the dead exhibited pecu- liar appearances. Their faces and necks were of a uniform violet tint, spotted with blackish ecchymosis, and in some instances blood and froth oozed from the mouth and nostrils. —As in hanging, so in drowning, life is destroyed by different modes, sometimes by suffocation, or rather by the asphyxia which causes this. This is the most usual form of death by drowning. Another form is that of syncopal asphyxia. In these cases, the coldness of the water, or per- haps intoxication, throws the system into a con- dition of nervous inaction, and the body pre- sents only the appearance of simple asphyxia, paleness of the body, no froth in the trachea or bronchi, and but slight disturbance of the in-ternal organs. Still another cause of death is apoplexy from cerebral congestion. A drowned body usually presents general paleness of the skin, yet the face will be discolored if death was preceded by long-continued struggling. It is to be remarked that upon exposure of the body to the air, discoloration very speedily ensues. The eyes may be found half open, at- tended by dilatation of the pupils. These signs, as also frothing at the mouth, may proceed from other violent means, but still are strong proof of drowning. Of the internal appearances of the body may be mentioned a fulness in greater or less degree of the blood vessels of the head and of the right side of the heart. The con- gested condition of the brain varies with the proximate cause of death. If that was apo- plexy, it would certainly be present, but rarely or not at all in the case of syncope asphyxia. The blood of the drowned is generally found fluid. The existence of froth in the bronchi is perhaps not a conclusive proof of the mode of death; but it is certainly the result of vital action, and so may be a valuable sign in con- junction with others to prove that life existed when the body was immersed. The presence of water in the stomach is merely accidental, and is not very nearly connected with the cause of death. As upon high authority it is asserted that water cannot pass into the stomach after death, its presence in it may be in certain in- stances significant. When death arises from obstruction of the breath by water, and not by apoplexy, some of the fluid enters the lungs with the last efforts of inspiration. Yet neither the fact that it is found there, nor its quantity, can be regarded as proving conclusively that death took place in consequence of immersion; for under favorable circumstances water may penetrate into the lungs even of a dead body. —Fodére defines poisons as those substances which are known by physicians to be capable of altering or destroying, in a majority of cases, some or all of the functions necessary to human life. The intent with which such a substance is administered enters of course into the legal conception of a poison. Poisons may be ranked under the two great divisions of ir- ritant and narcotic. To irritant poisons belong the corrosive acids and some of their com- pounds, the alkalies and their salts, the metallic compounds, and the vegetable, animal, and me- chanical irritants. The characteristic of these poisons is the inflammation which their appli- cation excites. Their most notable effects upon the human body are heat, irritation, or singu- lar dryness in the oesophagus, accompanied by a sensation of strangling; pain in the stomach and intestines or in the region of the kidneys, followed by strangury; evacuations both by vomiting and at stool, convulsions, faintings, cold sweats, and an irregular thready pulse. There is usually a retention of the intestinal faculties until the disease approaches a fatal termination. Narcotic poisons, on the other hand, which include many vegetable substances, prussie acid and its compounds, and the nar- cotic gases, nitrogen, carbonic acid and oxides, oxygen, hydrogen, and others, are distinguished by the disorders which they produce in the nervous system. They are defined by Orfila to be those which cause stupor, drowsiness, paralysis, or apoplexy and convulsions. Among their usual effects, in the various stages of their influence upon the body, may be men- tioned numbness, coma, and sometimes delir- ium, cold and fetid perspiration, swelling of the neck, face, and sometimes of the whole body, dilatation of the veins, protrusion of the eyes, general prostration, chilliness and pa- ralysis of the extremities, and, just preceding death in some instances, pain and convulsions. The narcotic-acid poisons produce combina- tions of several of these symptoms. The effects of poisons differ widely in different persons, and are more or less distinctly marked accord- ing to the form, whether solid or liquid, in which the poisonous substance is administered. The symptoms are naturally varied too by the condition of the system, particularly of the stomach, when the poison is taken. It may be added here that the effects of poisons may be closely imitated by certain diseases, as for ex- ample cholera. Rupture of various intestines,
of the stomach, the duodenum, or the uterus, may produce symptoms similar to those of irritant poisons. In seeking for the evidences of poison in a dead body, the first inquiry is as to the nature of the substance taken. It is a distinctive feature of the irritant poisons that they excite inflammation, in greater or less degree, in every part to which they are applied, and internally corrosions or perforations where the poisonous matter rests longest. The inflammation varies in extent and intensity. It is usually observed in the mouth, throat, and stomach, but may reach through the whole length of the digestive tube. The membranes are of various degrees of redness, sometimes accompanied by dark patches of extravasated blood, and sometimes also by ulceration. The traces of narcotic poisons are not so evident. Dr. Christison says even that the marked appearances which they leave are insignificant. Certainly, it is not characteristic of this class of poisons, as is often supposed, that they induce putrefaction, or that the blood remains fluid. Often, however, the veins of the head are found gorged with blood, the lungs bear black and livid spots, and their texture is less dense. These same changes, both in the brain and in the nature of the blood, are produced by the narcotic-acid poisons. For the purpose of charging innocent persons with murder, poisons have been in some instances injected after death. Orilla found that he could not reproduce in the dead body the appearances manifested by the living tissues. In the latter case, inflammation in graduated stages of intensity always attends the injury. But in his experiments there was always a perfectly defined line of demarcation between the points to which the poison was applied and those adjacent. In examination of the stomach, it is to be remembered that the vascularity or redness of this organ may arise as well from natural causes as from the influence of poisons. This appearance occurs, says an eminent author, in every variety of degree and character, under every circumstance of previous indisposition, and in situations where the most healthy aspect of the organ might be fairly inferred. Nor are marks of poisons to be confounded with those discolorations which may be produced by the liver and spleen. Ulcers and perforations have sometimes been wrongly attributed to the effects of poison. What is called the self-digestion of the stomach has often been mistaken for poison. In this condition of the organ its coats are rendered thinner and transparent, and sometimes the destruction of them advances even to perforation. These must be distinguished from those which are caused by corrosive poisons. The latter have clearly defined edges, and thick as the thickness of the coats which are pierced. These margins, too, are usually of a peculiar color, according to the poison employed; for example, yellow with nitric acid, brown or black with sulphuric acid and the alkalis, and orange with iodine. Finally, in a case of spontaneous erosion, there is generally a remarkable whiteness of the inner wall of the stomach; but in a case of poisoning there must be unequivocal signs of inflammation or of irritation.—In reference to the application of chemical tests, it may be remarked that poison may be absorbed or decomposed, and in such cases it may be found by boiling the stomach and intestines, and subjecting the fluid to proper tests. Poisons which remain in the dead body may be affected by the chemical changes involved. By the ammonia disengaged during decay acids may be neutralized; and by the action of the animal matter the mineral salts may be decomposed. Soluble poisons, as oxalic acid, disappear; arsenic, opium, cantharides, and strychnia are not essentially changed. Among the most important of the irritant class, or usually arranged in this class, are arsenic, the salts of mercury, lead, copper, and some other metals; sulphuric, nitric, oxalic, and some other acids. Of the narcotic class may be mentioned opium, prussic acid, strychnia, and the oils of cedar, tansy, and savin; but some of this class also cause nervous irritation.—Insanity, in all its forms, is an important topic of medical jurisprudence. (See Lunacy.)

MEDICI, a distinguished family of not well authenticated origin, though traced by some genealogists to the days of Charlemagne, and appearing in Florentine history since the close of the 13th century. In 1331 Giovanni de’ Medici, at the head of only 100 men, relieved the fortress of Scarperia by forcing his way through a Milanese army then besieging the place. A few years later Salvestro de’ Medici acquired great reputation by his firm resistance to the tyranny of the nobles. In 1378 he was chosen chief magistrate, and effected important reforms in the government in spite of the com- motions raised against him by the nobility. His son Vieri held also a high rank in the state, and was very popular with the common people. The family were largely engaged in commerce, and accumulated great wealth. The most suc- cessful merchant of them all was a second Giovanni de’ Medici, who, after serving for many years as a member of the seigniory and of the council of ten, was in 1421 twice chosen gonfaloniere, or chief magistrate, the term of the office being then two months. He died in 1429, leaving an immense estate to his two sons, Cosmo and Lorenzo,—Cosmo I., or Cosimo, called the Elder, was born in 1389, and even in the lifetime of his father had been deeply engaged in commerce, and had filled offices of state, having attained to a seat in the seigniory in 1416. The death of his father made him the head of the family, and he soon became the leading man in the state. His pow- er and that of his immediate descendants con- sisted in a tacit influence acquiesced in by the people, and not in any definite authority. The government of the republic continued to be di- rected by a council of ten and a gonfaloniere;
but the Medici generally either assumed these offices, or nominated their friends and partisans, while paying great deference to popular opinion, and avoiding all ostentation of power. Cosmo, however, was opposed at the outset by a powerful party, headed by the Albizzi family; and in 1443 Rinaldo de' Albizzi carried the elections against him, and procured a decree banishing Cosmo for ten years and his brother Lorenzo for five. At the end of a year the party of the Medici again prevailed, repelled the sentence of banishment, and exiled Rinaldo and his principal adherents. The rest of Cosmo's life was passed in prosperity, and in the promotion of letters and arts and the management of foreign affairs. He continued to the last engaged in commerce, which he carried on through agents. His mercantile transactions seem to have been chiefly with the East through Alexandria. The banking houses which the Medici maintained in the chief cities of Europe were a source of vast profits; and a considerable revenue was drawn from their numerous farms and mines, especially the mines of alum, of which they possessed nearly the monopoly in Italy. Cosmo himself lived in a simple style, but spent vast sums in erecting splendid public edifices. His wealth and influence ranked him with the most powerful princes of Italy, any of whom would have been glad to intermarry with his family; but as such connections might have given rise to unfavorable comments, he selected wives for his sons among the Florentine nobles. Cosmo died Aug. 1, 1464. By a public decree shortly before his death he received the title pater patriae, which was inscribed on his tomb. His son Giovanni died before him.—Pierino I, his successor, born in 1414, was almost constantly confined to his bed from ill health. He was less popular than his father, and a powerful party, headed by Luca Pitti, the builder of the Pitti palace, and by other prominent nobles, was soon formed against him. Failing to overthrow the Medici by peaceful measures, they attempted in 1466 to assassinate Pietro, but were baffled by his son Lorenzo. The failure of this conspiracy strengthened the Medici, and their principal opponents were banished, with the exception of Pitti, who abandoned his own party and suddenly went over to that of the Medici, who now became the almost undisputed masters of the state. Pietro had conducted with skill and credit several important negotiations during his father's lifetime, and his subsequent direction of the affairs of state was marked by prudence and judgment. He was a munificent patron of letters and arts. He died Dec. 3, 1469, leaving two sons, Lorenzo and Giuliano.——Lorenzo, surnamed the Magnificent, was born Jan. 1, 1448. At an early age he displayed extraordinary talent, and the magnificent disposition which afterward gave him a claim to the appellation of Magnificent. He had rendered himself conspicuous before he arrived at manhood by his poetical talents, and by his penetration, courage, and good sense. He was tall and robust, with a dignified countenance and pleasing manners; but his sight was weak, his voice harsh, and he was totally devoid of the sense of smell. He was educated by the first scholars of the age; when his studies were completed he visited the various courts of Italy, and his correspondence with his father during his absence shows that the latter had already learned to repose great confidence in the judgment of his son in political matters. The share taken by Lorenzo in defeating the conspiracy headed by Luca Pitti, and the magnanimity with which he treated the conspirators, extended his reputation throughout Italy. On June 4, 1469, he married Clarice Orsini, of the noble and powerful Roman family of that name. On the day after the death of his father in the same year, Lorenzo was waited upon by many eminent citizens of Florence, who requested that he would take upon himself the administration and care of the republic in the same manner as his father and grandfather had done. In 1471 he was sent to Rome at the head of a splendid embassy to congratulate Sixtus IV. on his elevation to the papacy, and was made treasurer of the holy see. But Sixtus undertook in 1474 the conquest of Città di Castello, on the border of the territory of Florence; and as its ruler Niccolò Vitello was a personal friend of Lorenzo, Florence lent some assistance to its defence, which, though ultimately unsuccessful, was so vigorous and protracted as to cause the pope great expense and vexation, which he attributed chiefly to Lorenzo. He was also incensed by the alliance which Lorenzo effected between Florence, Venice, and Milan, for the purpose of checking the ambitious projects of the pope and protecting the independence of the minor states of Italy. Sixtus thenceforward strove to destroy the power of the Medici, and he is even accused by many historians of having instigated a conspiracy for the assassination of Lorenzo and his brother Giuliano. The attempt was made during divine service in the church of the Reparata, on Sunday, April 26, 1478. The signal agreed upon was the elevation of the host, at which moment Francesco de' Pazzi and another conspirator named Bandini stabbed and instantly killed Giuliano. Two priests at the same instant attacked Lorenzo, but only succeeded in giving him a slight wound in the neck. He defended himself with vigor, and was presently surrounded by his friends, who escorted him home after putting to death all the conspirators present except a few saved by the interposition of Lorenzo himself. Meantime an unsuccessful attempt had been made to seize the government palace by the archbishop of Pisa, who was taken prisoner by the magistrates, and summarily hanged from its windows, together with Francesco and several others of the Pazzi, of which family the only one who escaped the popular fury re-
ceived shelter in the house of Lorenzo. Bandini took refuge in Constantinople; but the sultan ordered him to be sent in chains to Florence, because of the respect which he had for Lorenzo. The pope issued a bull excommunicating Lorenzo and the magistrates, and suspending the entire Florentine clergy, on account of the execution of the archbishop. He also, in conjunction with the king of Naples, made open war upon the republic, offering, however, to conclude peace on condition that Lorenzo should be banished from Florence, or delivered into their hands. As the resources of Florence were inadequate for a long contest with two such powerful enemies, Lorenzo, perceiving that the war was waged against him personally, took the extraordinary resolution of going to Naples, where through his personal influence, in spite of the utmost efforts of the pope, in the course of three months he converted the king from an enemy to a warm friend, and returned to Florence, bringing with him a treaty of alliance with Naples. Peace with the pope soon followed. Lorenzo now began to take measures for securing the peace of Italy by establishing a balance of power in the peninsula, of which Florence was to be the political centre. He also persuaded the people to agree to the institution of a permanent senate, nominated by himself, to govern the republic, instead of the democratic councils to whom the supreme power had been previously intrusted. A second attempt to assassinate him was made in a church in 1481. The assassins were seized before they could execute their purpose, and henceforth Lorenzo surrounded himself with a body guard. Sixtus IV. died in 1484, and was succeeded by Innocent VIII., who was friendly to Lorenzo, and in a short time made him his most intimate confidant, opening to the Medici the dignities and emoluments of the church, by which the family afterward so much profited. The alliance of the pontiff augmented still more the influence and prosperity of Lorenzo in Italy, which was now in a more prosperous condition than it had been for centuries, while Florence itself had reached the highest pitch of power and opulence to which it ever attained. Lorenzo's attention to public affairs had obliged him to neglect his own, and he became so involved by expenditures for political purposes that in 1490 the republic granted him an allowance to pay his debts, so large that, according to Hallam, he "disgracefully screened the bankruptcy of the Medici by her own." At this time he abandoned commerce, which his family had pursued for so many generations. In the beginning of 1492 he was attacked by a strange species of fever which baffled the skill of the physicians, and of which he died, April 8. He left three sons: Pietro, the eldest; Giovanni, the second, who became a cardinal at the age of 18, and afterward pope as Leo X.; and Giuliano, the youngest, who became duke of Nemours. Lorenzo was eminent not only as a statesman, but as a poet and scholar. Among his intimate friends were the poets Poliziano and Pulci. He was a munificent patron of authors and artists, and spent vast sums in erecting public edifices and establishing schools and libraries. He reestablished the university of Pisa, and greatly enlarged the famous Laurentian library at Florence, which derives its name from him, and which was founded by his grandfather Cosmo.—The Opere di Lorenzo de' Medici, detto il Magnifico, were published under the auspices of Leopold II., grand duke of Tuscany (4 vols., Florence, 1826). See Roscoe, "Life of Lorenzo de' Medici" (2 vols. 4to, London, 1796; best ed. in "Bohn's Standard Library," 1851), and Alfred von Reumont, Lorenzo de' Medici, il Magnifico, and seine Zeit (2 vols., Leipzig, 1874).—Pietro II., his son and successor, born Feb. 15, 1471, had much of the talent without the prudence of his father. His ambition and temerity involved Florence in war with Charles VIII. of France, and led to his own expulsion from the city in 1494, and to the occupation of Florence by the French army shortly afterward. After an exile of ten years, during which he made repeated though futile attempts to regain his authority, he entered the service of France, and perished at the great defeat of the French army by Gonsalvo de Cordova on the banks of the Garigliano, Dec. 29, 1503, being drowned in the river. By his death his second brother, Cardinal Giovanni de' Medici, became the head of the family. In 1512, partly by policy, partly by force, he effected the restoration of the Medici to Florence, and shortly afterward was himself elected pope. (See Leo X.) He intrusted the direction of Florentine affairs to his younger brother Giuliano, who, having more taste and capacity for literature than for politics, soon resigned his authority into the hands of his nephew Lorenzo, the son of the Pietro who perished in the Garigliano, and retiring to Rome became commander-in-chief of the papal troops. Having married Filiberta of Savoy, of the house of Bourbon, he was made duke of Nemours by Francis I. of France. He died in Florence, March 17, 1516.—Giuliano left a natural son, Ippolito, born in 1511, who was expelled with the whole house of Medici from Florence (1527), on the discomfiture of the holy league formed by Pope Clement VII. against Charles V. He became a cardinal, and his immense revenue enabled him, without territories and without subjects, to maintain at Bologna a court far more splendid than that of any Italian potentate. He was, says Roscoe, "at once the patron, the companion, and the rival of all the poets, the musicians, and the wits of his time. His associates and attendants, all of whom could boast of some peculiar merit or distinction which had entitled them to his notice, generally formed a body of 300 persons." He was poisoned by a domestique, Aug. 3, 1585.—Lorenzo II., born Sept. 13, 1492, after the resignation of Giuliano, 

344 MEDICI
governed Florence for some time under the orders of Leo X. He made himself by force of arms duke of Urbino in 1516, and in 1518 married Madeleine de la Tour, of the royal house of France. He died April 28, 1519, a few days after the birth of his famous daughter Catharine de' Medici. Prior to his marriage the duke of Urbino had an illegitimate son named ALESSANDRO, whose mother was an African slave. The paternity of Alessandro has also been attributed to Pope Clement VII., who was himself an illegitimate son of Giuliano, the brother of Lorenzo the Magnificent. It is certain that Alessandro was in high favor with the pontiff, who, on the death of Lorenzo II. without legitimate male heir, and the consequent failure of the descendants of Cosmo the Elder, brought him forward in order to prevent the power of the family from passing into the hands of a collateral branch descended from a brother of Cosmo. He accordingly availed himself of the dissensions of the Flor- entines, and in 1532, with the assistance of the emperor and the king of France, he compelled the republic to receive Alessandro as its ruler, with the title of duke. He proved, however, to be a licentious tyrant, and was assassinated on Jan. 6, 1537, by Lorenzino, a member of the collateral branch of the family. The citizens assembled on this event, and invested Cosmo de' Medici, surnamed the Great, the cousin of Lorenzino, with the sovereignty under the title of chief of the republic, which he afterward exchanged for that of grand duke. He became the progenitor of a line of grand dukes, six in number, who ruled Tuscany till 1737, when the main line of the Medici family became extinct. (See TUSCANY.)

MEDICINE, the science and art of curing disease. Some rude appliances to wounds and injuries, some equally rude observances in cases of internal disease, are common among the most barbarous people. The idea that disease is caused by the agency of superior and invisible beings placed its treatment in the hands of the priests, and the same idea caused that treatment to consist mainly of superstitious rites. In what beyond this consisted the medicine of the Egyptians and the Hindoos is a matter of conjecture only. In Greece as elsewhere the early history of medicine is involved in darkness, and it is idle to guess how much truth is contained in the fables concerning Chiron and his pupils Æsculapius, or the sons of the latter, the Homeric heroes Machaon and Podalirius. We know, however, that the temples of Æsculapius were from an early period the resort of the sick, who submitted themselves to the regulations of the Aselepiads, the priests of the temples. It was common among those who were cured to deposit in the temple a votive tablet, on which was inscribed some account of the case and of the remedies by which it was relieved; but if the tablets which have come down to us are fair samples, but little information could have been communicated in this way. Much more must have been due to the education in the temple, to personal observation, and to the restless and inquiring spirit which animated the early Greeks. But the temples of Æsculapius are not the only source to which the origin of scientific medicine is to be traced; in the schools of philosophy some attention was always paid to the healing art as a branch of general education. When the school of Pythagoras was broken up, and his disciples were dispersed, some of them attended to the practice of medicine; and unlike the Aselepiads, who confined their consultations to the temples, the Pythagoreans visited the sick at their residences. Of the extent of their knowledge or the value of their treatment we have no means of forming a judgment. Even at this period it seems that there was still another class, the charlatans, who, without any pretension to education, offered their nostrums for sale in the market place. Besides the temples of Æsculapius and the schools of philosophy, the gymnasia undoubtedly contributed to form the earlier physicians. The gymnasiarchs directed the regi- men of those who resorted to the gymnasia; they acquired practical skill in the treatment of the injuries to which their pupils were liable; they set fractures, reduced dislocations, directed frictions, dressings, &c. — In these various ways medicine had already made sensible progress when Hippocrates (born in Cos about 460 B. C.) collected the scattered knowledge of his time, and added to it by his own genius and observation. Of the numerous works ascribed to Hippocrates, enough are decided to be genuine by the unanimous consent of the learned to justify the veneration in which he has always been held as the father of rational medicine. Of anatomy the notions of Hippocrates were crude and limited, and must have been derived solely from the inspection of animals, since the religious prejudices of the ancients prevented the dissection of the human body, until a period long posterior to the one of which we speak. His physiology is on a level with his anatomy. The glands are spongy bodies destined to absorb moisture from the neighboring parts, and the brain, the largest of the glands, draws the vapors from the whole interior of the body. The use of the muscles is to cover the bones, &c. (Renouard, Histoire de la médecine.) The body itself is composed of the four elements differently combined in different individuals, and derived from them we have the four humors of the body, blood, phlegm, bile, and black bile, from which again are derived the four temperaments. Disease consists in a disordered condition of the fluids; these are subject to coction, which when complete terminates in a critical evacuation, the localization of the disease, and the forma- tion of a critical abscess, the occurrence of
erysipelas, &c. When coction could not take
place the disease was mortal. Crisis was apt
to occur on certain days, hence termed critical.
He speaks of a principle which he terms na-
ture (σωτηρ), which influences every part of
the human frame, superintends all its actions, pro-
motes those that are beneficial, and represses
those that are injurious; the great object of
the physician was to watch the operation of
this principle, to aid or restrain it, rarely to
counteract it. He regarded acute diseases alone
as the subject of treatment; chronic affections
were esteemed beyond the resources of art.
The great merit of Hippocrates lies in his de-
scriptions of disease, and the sagacity and fideli-
ity of his observations.—Not long after Hip-
pocrates, Praxagoras of Cos, the last of the
Asclepiadse whose name is mentioned in the
history of medicine, probably belonging him-
self to the family of Hippocrates, observed the
relation which exists between the pulse and the
general condition of the system. None of his
writings have been preserved. Aristotle was
the son of a physician, and probably in the
earlier part of his life practised medicine; his
knowledge of the structure of the body, de-

erived entirely from the dissection of animals,
was far in advance of that of his contempo-

daries; and he laid so widely the foundations
of comparative anatomy, that for ages little
that was new was added to what he had writ-

ten. He distinguishes between the nutritive,
the sensitive, the motive, and the intellectual
faculties. The first is common to plants and
animals, to everything which lives and dies;
the last is confined to a very few species of
animals. The first three faculties reside in
every part of the body; the intellect alone has
a special seat. Where this is he nowhere ex-

dressly says, but it is evident from a variety of
passages that he placed it in the heart. He
speaks of the greater size of the brain in man-

kind, says it is composed of two lobes and of
the cerebellum, and mentions the ventricles.
Of the nervous system he was ignorant, confound-
ing the nerves with the tendons. Of the lungs
his account is reasonably correct. The blood
vessels as well as the nerves he derives from
the heart, which alone contains blood of itself,
that of the lungs being contained in the vessels
connected with the heart. The blood is the
most important of the fluids, and is necessary
to life; deprived of it to a slight extent, the
animal faints, to a greater dies, while its at-
tennation and alteration give rise to disease.—
So soon after its foundation, Alexandria, under
the fostering care of the Ptolemies, became the
centre of the science and learning of the time.
This was especially the case with regard to
medicine; the formation of the Alexandrian
library at a time when books were rare and
expensive, the personal support of the Ptole-
mies, the new drugs which commerce brought
from distant countries, and above all the au-
thorization of human dissections, gave a great
impulse to medical science. But the works of
the Alexandrian school have entirely perished,
and we can only judge of them by the reports
which are scattered through the writings of
Aretaeus, Celsus, Pliny, Galen, &c. Of the
earlier members of the Alexandrian school,
Herophilus and Erasistratus were the most dis-

tinguished. The former was familiar with the
lactic vessels and their connection with the
mesenteric glands; the muscles were no longer
a mere covering for the bones, but their
proper office was attributed to them. Erasis-
tratus was acquainted with the functions of
the nerves, and is said to have invented the
catheter; while Ammonius, another member
of the Alexandrian school, invented an instru-
ment for the crushing of stone in the bladder,
thus perhaps anticipating an improvement of
our own day. With Herophilus and Erasis-
tratus the zeal for anatomy seems to have died
out; between them and himself, a period of
nearly 500 years, Galen enumerates five or six
physicians only who occupied themselves with
human dissections.—Until the rise of the Al-

xandrian school, dogmatism or rationalism, for-
tified by the authority of Hippocrates, had
been the prevailing system. The dogmatists
maintained that in order to treat disease we
must be acquainted with its occult as well as
exciting causes, and with the natural actions
of the body, as concoction, nutrition, &c. To
this Philinus of Cos and Serapion of Alex-

dria replied that the occult causes of the dog-
mast depended entirely upon hypothetical
opinions; that the minute motions and changes
of the internal parts were beyond our obser-
vation; that even where the cause of a disease
was known, it by no means followed that such
knowledge led to a remedy; and that close
observation of disease and experience of the
effects of remedies in its treatment were the
only safe guides to medical practice. The
new doctrine, or empiricism as it was termed,
long divided medical opinion with dogmatism,
though the writings of its advocates have en-
tirely perished, and we are acquainted with
their views mainly through the summary given
by Celsus. About 150 years after the origin
of empiricism, Asclepiades of Bithynia, at first
an eminent rhetorician, began to practise med-
icine at Rome. A philosopher rather than a
physician, he was a follower of Epicurus; and
on the theories of his master he founded a
new medical doctrine which, aided by the
popularity of the Epicurean philosophy, as
well as by its novelty and simplicity, soon
found numerous followers. According to As-

clepiades, the human body is permeated in
every direction by pores through which at all
times atoms varying in form and volume are
constantly passing. Health consists in the
symmetry between the pores and the atoms
which pass through them. Disease is an ob-
struction of the pores or an irregularity in the
distribution of the atoms. This theory was
further developed by Themison of Laodicea,
a pupil of Asclepiades, who made all diseases
depend upon constriction or relaxation, or upon a third and mixed condition, while all remedies were divided into astringents and relaxants. Asclepiades, it is said, was the first to divide diseases into the two great classes of acute and chronic. While the dogmatists made the fluids the prime seat of disease, and ascribed the origin of all maladies to some alteration in them, the methodists on the other hand thought the solids were first affected, and that the derangement of the humors was but secondary; and the dispute about the humoral pathology and solidism, thus originated, has continued under various forms to our own time.—For 600 years, according to Pliny, Rome had no physicians; not that no attempt was there made to cure diseases, but that these attempts consisted mainly in superstitious observances. Thus, according to Livy, following the advice of the Sibylline books, pestilence was repeatedly stayed at Rome by erecting a temple to Apollo or to Æsculapius, by celebrating public games, or by the dictator driving a nail into the capitol; and Cato the Censor trusted to simples with charms and incantations. When intercourse with Greece became common, Grecian philosophy and science were transplanted to Rome. Asclepiades was the friend of Cicero, and Caesar when he was taken by the pirates was accompanied by his physician. On attaining supreme power, Caesar decreed that all physicians at Rome should enjoy the privileges of citizenship. After the names of Asclepiades and Themison, that of Soranus occurs prominently among those practising medicine at Rome; there were probably three physicians of this name, but the most celebrated was a Greek educated at Alexandria and settled at Rome; his writings have perished, unless, as some have supposed, those of Cælius Aurelianus are a translation of them. Cælius is said to have been a native of Numidia, and probably flourished in the 2d century. Of numerous works of which he was the author, that on acute and chronic diseases is alone preserved. It is written in barbarous Latin, but in its description of disease is a great advance on earlier authors. Cælius, like Soranus, belonged to the methodic sect, and is its principal exponent. Of the few Latin medical authors, Cælius is the chief. He appears to have lived in the 1st century, and to have written voluminous treatises on architecture, rhetoric, philosophy, &c., all of which have perished. His book De Medicina is a digest of what was known to the ancients on the subject, and shows the great progress which medicine had made in consequence of the labors of the anatomists of Alexandria. Cælius treats of most of the great operations of surgery, of the operations for stone and hernia, of wounds of the intestines, of catarrh; he gives directions for the use of the catheter, speaks of the trephine in injuries of the brain, and of the use of the ligature in divided or lacerated blood vessels, in varices, and in hemorrhoids. The name of Andromachus, a native of Crete and physician to Nero, has come down to us as the inventor of certain polypharmaceutical compounds, one of which, the theriac, containing the dried flesh of vipers, with 60 other ingredients, was retained in the pharmacopoeias of the last century; and he is likewise the first to whom was given the title of archiater. Probably contemporary with Cælius Aurelianus was Aretæus of Cappadocia; we know nothing of him but his birthplace; he has left a treatise on diseases remarkable for accurate and spirited description, and which is one of the most valuable of the medical works of antiquity. Galen (born in Pergamus, A.D. 180), after Hippocrates, has had a far wider share of renown than any other physician; for more than 12 centuries his authority reigned supreme in the schools; even facts were disputed if they were against the authority of Galen. He adopted the Hippocratic theory of the four elements, the four humors, and the four qualities, elaborating and refining upon them at great length and with great subtlety, and making them the groundwork of his doctrines. Besides the solids and the fluids, he assumed a third principle, the spirits, as entering into our composition. These spirits were of three kinds: the natural spirits, derived from the venomous blood; the vital spirits, formed in the heart by the action of the air we breathe upon the natural spirits, and which are driven through the arteries; and the animal spirits, formed in the brain from the vital spirits. He also supposed the human soul to be composed of three parts: a vegetative, residing in the liver; an irascible, in the heart; and a rational, having its seat in the brain. The most valuable of the works of Galen are those in which he treats of anatomy and physiology. He appears to have dissected animals only, and he recommends students to visit Alexandria, where they could study from the human skeleton. Considering the narrowness of his resources, his descriptions are wonderfully correct, and they comprehend all that was known of anatomy until the time of Vesalius. Diocorides, who lived probably in the early part of the 2d century, for many centuries shared the authority of Galen. He has left a work on the materia medica which comprises all that was known to the ancients upon the subject; its arrangement is bad, and the descriptions of the articles so vague that many of them can no longer be recognized with certainty; yet imperfect as it may be, it was for 1,400 years a standard treatise.—From the time of Galen medicine began to participate in the decline which had already overtaken art and literature. Dissections were no longer made; the earlier Christians had as great a horror of profaning the dead body as the pagans, and medical writers, appearing at rare intervals, contented themselves mainly with abridging or copying the works of Galen. Oribasius in the
4th century, Aëtius about 500, Alexander Trallianus in the 6th century, and Paulus Aëtius in the 7th, all wrote in Greek, and were all zealous Galenists. It is but just to observe that Paulus seems to have been fuller than his originals in the description of surgical diseases and operations. It was only when medicine already tended toward its decline that it became legally organized. In the pagan world every one practised at his will, making his way by such qualities as he possessed. The injury done by quackery and imposture led finally to a remedy. Under the Christian emperors every town of a certain size had its archiateri (chief physicians), and no one could practise medicine without having undergone an examination by them. They were paid by the state, and in return were bound to attend the poor gratuitously. In a number of the principal towns medical schools were established, in which the professors and lecturers received a regular salary. The archiateri of the emperors had the title of count or duke, and ranked with the principal officers of state.

Hospitals and dispensaries were their origin to Christianity; the pagans appear to have had no analogous institutions. The first hospital seems to have been founded at Cæsarea by St. Paul toward the end of the 4th century, and the example was soon followed by the pious, the powerful, and the wealthy.—While the western empire had sunk into barbarism, and the eastern, sadly limited, was struggling for existence, medical science found refuge among the Arabians. Excepting on two points, they contributed little or nothing to its advancement; but Rhazes, Ali Abbas, Avicenna, Albucasis, with the Spanish Saracen s Avenzoar and Averroes, were all voluminous writers. Their writings consist mainly of compilations from the Greek authors, chiefly from Galen, whose subtleties and refinements were suited to their genius; yet the "Canon" of Avicenna was for several centuries the received text book in the medical schools of both the Arabians and Europeans; and all the knowledge Europe had of the Greek authors was derived from the translations of the Arabs. In two particulars, as was mentioned, the writings of the Arabians are of high interest: 1. In them we get the earliest clear account of the existence of eruptive fevers; these were divided by them into two forms, variola (smallpox) and morbilli (the little pustles), the latter including measles, scarlet fever, and probably other non-vesicular eruptions. 2. Not only do we derive from the Arabians a number of our milder purgatives, cassis, manna, rhubarb, together with tamarinds, cantharides, &c., but in their pursuit of alchemy they produced distilled liquors, some of the metallic salts, and many new pharmaceutic preparations, and laid the foundations of a science which has been of the most essential service to medicine.—As order began to emerge again from the chaos of barbarism which succeeded the fall of the western Roman empire, monks and priests became the principal physicians, and a little medicine was taught in some of the monasteries; for a long time the Benedictine monks of Monte Casino enjoyed in this respect an extended reputation. From the 9th to the 13th century the Jews, acquiring in their commerce with the Saracens such knowledge as was possessed by the latter, became celebrated as physicians; and as such, despite the laws which forbade them to administer remedies to Christians, obtained access to courts and even to the palace of the Roman pontiffs. One small town affords a glimmer of light during the darkness of this period. The school of Salerno is said to have been founded about the time of the destruction of the Alexandrian library by the Saracens. Toward the end of the 8th century it had attained reputation, and from the 10th to the 13th was at the height of its celebrity. The Regimen Sanitatis Salernii, the dictetie precepts of the school of Salerno, composed by John of Milan for the use of Robert duke of Normandy, the son of William the Conqueror, has been frequently republished and commented (translated by Prof. Ordonaux, New York, 1872). The most celebrated member of this school was Constantinus Africanus, who, driven from his native country as a sorcerer, for a time taught at Salerno. His works, which are numerous, are translations from the Arabic, written in barbarous Latin. In the early part of the 13th century Frederick II. published an edict that no one should practise medicine in the kingdom of Naples until he had been examined by the faculty of Salerno. The candidate, after completing his course of studies, was examined on the Therapeutics of Galen, the first book of Avicenna, and the Aphorisms of Hippocrates. He afterward swore to be pure in his life, to be submissive to the laws, to attend the poor gratuitously, and not to share the profits of the apothecary. He then received a diploma, but for the first year was compelled to practise under the superintendence of an older physician. About the year 1316 Mondino, a professor in the university of Bologna, dissected the bodies of two females; he afterward published an anatomical description of the body, which for the next 300 years was used as a text book in the Italian universities. His merit consists mainly in the boldness of his undertaking, as his anatomy was not much in advance of that of Galen. He did not open the cranium, for fear of committing a mortal sin. Before the year 1500 human dissections were prosecuted at Bologna, Padua, and Pavia. Toward the commencement of the 16th century Du Bois, or Sylvis, as his name was Latinized, used the human body in his demonstrations at Paris as often as it could be procured. Galen was still looked up to as an indisputable authority; and when the results of dissection did not coincide
with his descriptions, they were looked upon as exceptions to the general rule, or as evidence of the degeneracy of the human race. Such was the state of things when, about the year 1543, Vesalius, professor of anatomy in the university of Padua, published his great work on anatomy, in which he pointed out the errors of Galen, and maintained that his descriptions were taken, not from human dissections, but from those of apes. The age was one of anatomical discovery, and Columbus, the successor of Vesalius at Padua, Eustachius at Rome, and Fallopius, confirmed and increased the discoveries of Vesalius. The prejudices against human dissection were mitigated, subjects became comparatively abundant, and printing and engraving served to spread abroad and perpetuate the discoveries that were made.—After the fall of Constantinople, learned Greeks carried a knowledge of their language and literature to the western world. Previous to this date the Greek medical writers had been read only through the medium of faulty Arabic translations; but medical men now availed themselves of this new source of information, and translations of Galen, Hippocrates, Dioscorides, and others were made directly from the Greek. Thomas Linacre, physician to Henry VIII. and to Mary, distinguished himself in this career; he established professorships at Oxford and Cambridge for illustrating the works of Hippocrates and Galen, and laid the foundations of the royal college of physicians at London. Among those distinguished in the same path were Mercuriali, Foces, and J. Fernel; and the attention of physicians as of the learned throughout Christendom was directed to rescuing and illustrating the remains of antiquity rather than to original research.—While medicine was thus recovering the ground it had lost, surgery also was improving. Physicians in the middle ages being invariably priests, whom a canon of the church forbids to shed blood, surgical operations commonly fell into the hands of an inferior and ignorant class of barber-surgeons, who frequently were litterants. Gradually matters improved; the clerical physicians occasionally operated, while the barber surgeons struggled to raise themselves to a higher rank. Gui de Chauliac, a learned priest who published about the year 1363 the earliest modern work on surgery, operated himself; while in the 16th century the great anatomists Vesalius, Fallopius, &c., were likewise distinguished surgeons. But surgery received its greatest impulse from Ambrose Pare, who commenced his career as a barber-surgeon. At that period wounds received from firearms were considered poisonous, and it was customary on this account to cauterize their track with boiling oil. In 1536, on one occasion, while serving as surgeon with the French army in Provence, Pare's supply of oil failed him. He could not sleep for anxiety, but in the morning he found that those who had not been cauterized were doing better than those who had, and this soon led to a revolution in practice. The application of the ligature instead of the actual cautery to restrain hemorrhage after amputations was another of his discoveries.—While the authority of Galen was disputed by the anatomists on matters of fact, his opinions were attacked by a new school of physicians, who were the offshoot of the prevailing study of alchemy. Of this school Paracelsus obtained the greatest notoriety. He publicly burned the works of Galen and Avicenna at Basel, but had nothing to substitute for them but wild and incoherent speculations. Perhaps it was partly owing to the growing spirit of independent observation that we first hear during the 16th century of a number of new diseases. Whooping cough, scurrvy, the sweating sickness, and syphilis were now first described. Of scurrvy we must believe that the causes which produce it at present must have produced it from all time; and that if it seldom occurred in ancient times, it must have been because of the different modes of living and the short duration of the voyages. With syphilis the case is different; the theory of the American origin of the disease is now shown to be unfounded, and whether it had existed obscurely for a long time, or whether it arose, as some think, from a degeneration of the leprosy so prevalent in the middle ages, its sudden explosion at Naples at the end of the 15th century and its rapid spread throughout Europe are equally unaccountable.—The great anatomists of the 16th century had paved the way for the discovery of the circulation of the blood. Celsausinus, in his Speculum Artis Medicinae Hippocratis, had shown a knowledge of the system of the circulation of the blood. Servetus had proclaimed the lesser circulation through the lungs; the valves of the heart, of the aorta, and of the veins were known; it was proved by experiments on living animals that when an artery was tied the blood no longer flowed, and the pulse ceased on the side most distant from the heart; that when a vein was tied it swelled below the ligature, while it became empty on the side toward the heart. And yet the last step was not made. At length William Harvey, after having for about 10 years taught the circulation of the blood in his lectures, in 1628 published his doctrine to the world; and though meeting at first with opposition from some of the older members of the profession, it made rapid progress and was universally adopted during the lifetime of its discoverer. In 1661 Malpighi by the aid of the microscope showed the course of the globules of the blood in the smaller vessels, and 30 years later Leuwenhoek was able to follow the circulation into the minutest capillaries. The true theory of respiration soon followed the discovery of the circulation. The ancients taught that the minute bronchial tubes inosculated with the pulmonary veins, and that the air thus found its way into the heart. In 1661 Malpighi demonstrated the vesicular substance of the lungs, and about the
same time Borelli and others showed the mechanism by which respiration is accomplished. In 1622 Gaspard Asseil, professor of anatomy at Milan, discovered the lachetal vessels; and about 30 years later Jean Pecquet demonstrated the reservoir which bears his name, together with the thoracic duct from its commencement to its termination in the left subclavian. The lymphatic system, the nerves, the brain, and the organs of special sense were all studied with care. In 1747 Haller published his Prima_linea_Phyiologian, and 10 years later his Elementa Physiologian Corporis_Humani; and from this period physiology had a distinct existence as a science.—In the mean time the materia medica had been enriched by a number of new articles. The chemists had introduced a variety of metallic and alkaline salts, and the new world had yielded guaiacum, sar-saparilla, ipecacuanha, &c.; but two remedies from their importance require a more special notice. On the first appearance of syphilis the surgeons had attacked it by means of mercu-
rial frictions, and with success; but their employment in numerous instances was attended by such terrible consequences, that they gradually fell into disuse. Paracelsus had employed mercury internally, but in the hands of such a practitioner it could rarely be productive of other than mischief; the Galenists condemned its use, and the chemical physicians gave it rarely and secretly. Gradually it again came into favor, and in 1750 Van Swieten, the phy-
sician of Maria Theresa, directed all the cases of syphilis in the military and civil hospitals of the Austrian empire to be treated with small doses of corrosive sublimate in solution, and the practice soon became common throughout Europe. The ancients, with whom malignant diseases were common, had no specific means of arresting their attack; even mild intermit-
tents often continued for an indefinite time, and finally induced organic changes and dropsey. In 1630 Peruvian bark is said to have been introduced into Spain by the countess of Cienfuegos; and though the extravagance of its price, the adulterations it sometimes met with, and its nauseousness were obstacles to its success, its use soon became common throughout Europe.—As chemistry, from vain search after the philosopher's stone or the elixir_vita, began to assume the aspect of a science, it influenced more markedly the prevailing medical doctrines. Francis de le Boër or Sylvius, a Fleming called to the professorship of practical medicine in 1658, was the first to present a chemical theory of the actions of the animal economy. Ac-
cording to this theory, digestion and nutrition were the consequence of specific fermenta-
tions, in which the saliva, the pancreatic juice, and the bile take part. Fevers were produced by other fermentations caused by a vicious bile or lymph. Certain of the humors were naturally acid, others alkaline; in a state of health these were in equilibrium, but disease was conse-
quent upon the predominance of one or the other. This doctrine, more or less modified, had many followers, and for a time was prevalent both on the continent and in England. Willis and Thomas Sydenham may be ranked among the iatro-chemists; but Sydenham is much the more remarkable for the careful and conscientious manner in which, uninfluenced by theory, he gave himself up to the observation of disease.—While the chemical school was taking form at the north, in Italy the progress of physical science was turning the attention of theoretic physicians in a new direction. Alfonso Borelli, a profound mathem-
atician, was the originator of what has been termed the iatro-mathematical school. In the first part of his work De Motu Animalium he applies the received principles of physics to the subject of muscular action, treats of the various attitudes and modes of progression of men and animals, of walking, running, leaping, flying, swimming, and enters into learned and curious calculations of the amount of force which is expended in particular acts. In the second part he treats of the internal move-
ments, of those of the heart, of the blood in the vessels, and of the action of the intestinal canal; the whole body was regarded as a ma-
chine, and the laws of mechanics, of hydraulics and hydrostatics, were rigidly applied to it. As an instance of the futile but elaborate calcula-
tions into which the mathematical physicians were led, Borelli calculates that the heart at each contraction overcomes a weight of 180,-
000 lbs. The physiology of the mathematical school had its influence upon their pathology; and the terms derivation, reversion, lento,) ob-
struction, resolution, &c., all founded on phys-
ical principles, were universally used. The mathematical school had many and eminent followers throughout Europe: in Great Brit-
in, Pitcairn, Freind the historian of medicine, and Mead; in Holland and Germany, Boer-
haave and John Bernoulli; in France, Sau-
vages, the eminent and learned nosologist, and Senac, the physician of Louis XIV. Hermann Boerhaave, professor of medicine at Leyden, had great talent and immense learning, and was an accurate observer and a sagacious prac-
titioner. He was one of the first to devote himself to clinical teaching, and he was fortu-
nate in the devotion of such pupils as Van Swieten and Haller. Unfortunately for his permanent reputation, he lived in an age of transition, and his system, generally received during his lifetime, scarcely survived its author. Jean Senac, another of the mathematical phy-
sicians, to whom Morgagni applies the epithet of "great," published a book on diseases of the heart, which has only been rendered obsolete by the introduction of the new methods of aus-
cultation and percussion.—While the chemical and mathematical physicians were reducing the actions of the living body to the laws which govern inert matter, a wholly opposite tenden-
cy manifested itself in Germany. Previously indeed Van Helmont, a mystic and alchemi
but that of Edinburgh, contributed greatly to raise the latter school to the high rank which it has since enjoyed. His teachings and writings exercised a wide influence, and their effects can still be traced in English medicine in our own day; his descriptions of disease in particular are remarkable for their force and conciseness, but the progress of science has shown the fallacy of the views on which his system was founded. A contemporary and rival of Cullen, John Brown, a man of genius but of wayward and ill regulated character, was likewise the author of a system which enjoyed a temporary popularity, and which, somewhat modified, found eminent followers in Italy within a recent period. — The end of the last century witnessed the most important practical discovery ever made in medicine. Up to that period smallpox annually committed the most fearful ravages; the deaths from it in Europe alone were estimated to amount to 400,000 a year, while it left many blind or disfigured. The practice of inoculation, brought from Constantinople by Lady Mary Wortley Montagu, had indeed diminished the evil, but the remedy itself was attended with great inconvenience, and was not destitute of danger. The discovery of Jenner, announced in his "Inquiry into the Causes and Effects of the Variola Vaccina" (London, 1798), has placed the disease completely under our control; and if it still commits occasional ravages, it is owing to the laxity of the laws and the carelessness of individuals. Another great improvement in practical medicine, the use of lemon juice, sour krout, &c., in the dietary of seamen, by which scurvy, which formerly committed fearful havoc on both the naval and mercantile marine, has become almost unknown, is due to the naval surgeons of the last century. — In the present century practical medicine has made greater advances than in any other similar period. This may be attributed: 1, to the brilliant discoveries which have rendered chemistry a new science, by the aid of which we are now able to comprehend much more clearly than before the processes of nutrition, respiration, caloricisation, secretion, and excretion; 2, to the increased attention paid to microscopy, by which the mode of development of the germ, the organization and growth of the different tissues, the process of repair and that of inflammation, and other morbid processes, have been investigated; 3, to the rapid progress of experimental physiology, aided by chemistry and microscopy; 4, to the increased cultivation of comparative anatomy and physiology; 5, to the cultivation of morbid anatomy not only in relation to the symptoms of disease during life, but to the various degrees of morbid developments, and to the relation which those developments bear to each other; 6, to the new and more perfect methods of investigating disease, by which its diagnosis has become more certain. Under the last head two discoveries are prominent, which have changed the whole face of medicine, giving it a degree of certainty which at one time seemed hopeless: that by Laennec of auscultation and percussion, and that by Bright of the disease of the kidney which bears his name. The development and perfecting of each of these discoveries has employed and is employing the lives and founding the reputation of a vast number of learned, zealous, and able men.
MEDILL

Joseph, an American journalist, born in New Brunswick, near the border of Maine, April 6, 1823. His parents, who were Scotch-Irish, removed to Massillon, O., in 1829, where Joseph passed the next 12 years on his father's farm. He studied and practised law, and in 1849 established the "Republican" at Coshocton, O., as a free-soil whig paper. In 1852 he sold this journal, and founded the "Forest City" in Cleveland, O., advocating the election of Winfield Scott as president, but repudiating the Baltimore platform. In 1853 his paper was merged in the "Leader," and in 1854 he was one of the 12 who formed the republican party in Cleveland. In that year he removed to Chicago, and with John C. Vaughan and Dr. C. H. Ray purchased the "Tribune," with which he has been connected since May, 1855. In 1870 he was elected to the state constituen-
tional convention, and was the author of the minority-representation clause. In 1871 he was a member of the United States civil service commission, which post he resigned on being elected mayor of Chicago. In September, 1878, he resigned the mayoralty and went to Europe. In November, 1874, he returned and purchased a controlling interest in the "Tribune," becoming editor-in-chief.

MEDINA. I. A S. W. county of Texas, bounded N. E. by the Medina river; area, 1,175 sq. m.; pop. in 1870, 2,078, of whom 92 were colored. The surface is rolling and in some parts hilly. Timber and water are scarce. Stock raising is the leading industry. In 1870 there were 45,561 cattle. Capital, Castroville. II. A N. E. county of Ohio, drained by Black and Rocky rivers; area, 425 sq. m.; pop. in 1870, 20,092. The surface is uneven and the soil fertile. The Atlantic and Great Western railroad passes along the S. border. The chief productions in 1870 were 304,906 bushels of wheat, 393,996 of Indian corn, 537,217 of oats, 149,911 of potatoes, 18,906 of flax seed, 302,702 lbs. of flax, 226,536 of maple sugar, 408,790 of molasses, 979,916 of butter, 416,956 of cheese, and 48,619 tons of hay. There were 7,588 horses, 24,329 cattle, 69,742 sheep, and 10,719 swine; 5 manufactories of agricultural implements, 12 of cheese, 1 of lead and zinc, 3 of woolen goods, 19 saw mills, 1 planing mill, and 2 flour mills. Capital, Medina.

MEDINA (Arab. Medīnät en-Nēbī, "city of the prophet"), a city of Arabia, in the province of Hejaz, situated on the vast plateau of high land which forms central Arabia, about 250 m. N. of Mecca, in lat. 24° 50' N., long. 39° 50'E.; pop. about 17,000. It is the second in sanctity of the three holy cities of the Mohammedans. The sacred area is embraced within an imaginary line forming an irregular circle, of which the town is the centre, and of which the diameter is about 12 m. Medina consists of three parts, a town, a fort, and suburbs. The town proper is walled and has four gates. The streets are narrow and dark, and imperfectly paved, and the town has a general appearance of decay. The houses are of brick, basalt, and palm wood; the best of them enclose spacious courtyards and small gardens with wells. The castle joins on to the N. W. angle of the city. The suburbs are S. and W. of the town, and between it and them is the plain of Al-Munakah. They contain five mosques and the governor's house. The mosque of the prophet is at the eastern extremity of the city. A saying of Mohammed is cited to the effect that one prayer in it is more efficacious than 1,000 in other places, excepting Mecca. The present building, occupying the site of a smaller one existing in the time of Mohammed, is a parallelogram about 420 ft. long by 340 broad. It has a spacious central area open to the sky, surrounded by a peristyle with numerous rows of pillars, surmounted by small domes, and having five gates and five
MEDINA SIDONIA

Minarets. In the centre of the court is a piece of ground about 80 ft. square enclosed by a wooden railing, and called the garden of Fatima, the prophet's daughter. Near this enclosure is the well of the prophet. In the covered part of the mosque are the tombs of Mohammed and of the caliphs Abu Bekr and Omar. They are concealed by a curtain of silk, and have never been seen by a Christian, and the Mohammedan accounts of them are contradictory. At present even Mohammedans are not allowed to see them; the persons in charge declare that whoever should look upon them would be blinded by supernatural light. This mosque has been many times destroyed and rebuilt, the last time in 1710. The town has little commerce, and what trade exists is in grain, cloth, and provisions, and is carried on through the harbor of Yembo, on the Red sea, about 110 m. from Medina. The climate, though hot in summer, is severely cold in winter, owing to the elevation above the sea. The people are proud and indolent, and live in great part upon the revenues of the mosque, which has estates in almost all parts of the Mohammedan world. Thirty public schools still remain in this once famous seat of learning. - Medina was anciently called Jathrippa, and by the Arabs before Mohammed's time Yathreb. It is the place to which the prophet fled from persecution at Mecca, and where he died. For about 40 years after his death it was the seat of the caliphate. - See Burton's "Personal Narrative of a Pilgrimage to El-Medina and Mecca" (1856).

MEDINA SIDONIA, a town of Andalusia, Spain, in the province and 22 m. E. S. E. of the city of Cadiz; pop. about 11,000. It stands on a hill in the midst of an extensive plateau, and is laid out in the form of an amphitheatre. The parish church, Santa Maria la Coronada, is a fine Gothic building. There are five convents, two nunneries, ten schools, and hospitals for the sick and for orphans and foundlings. The surrounding country produces excellent fruits. There are brick and pottery works, and manufactories of coarse cloth. Medina Sidonia gives the title of duke to the descendants of Guzman the Good.

MEDITERRANEAN SEA, the great midland sea separating the southern shores of Europe from the north coast of Africa, and bounded E. by part of Asia. It was not known to the ancients by its present name. It is called the Great sea in the Scriptures, "the sea within the columns" by Strabo. By the Romans it was called mare internum or mare nostrum. The Mediterranean forms a deep gulch which communicates with the Atlantic through the narrow strait of Gibraltar; it is separated from the Red sea by the isthmus of Suez, now pierced by a canal, and penetrates deeply inland through the Adriatic, and still more so through the Black sea and sea of Azov. - The N. and S. shores of the Mediterranean present a strong contrast; the former is greatly diversified by bays and peninsulas, sinuosities, and islands, while the latter is comparatively uniform. The main body of the sea is divided into two principal basins, each with numerous subdivisions. The western is the smaller, and extends from Gibraltar to the strait between Sicily and the coast of Tunis, the shallowest part of which is called the Adventure bank. The eastern and greater extends from this to the coast of Syria. The subdivisions of these basins have received different names. The westernmost, reaching from Gibraltar to the islands of Corsica and Sardinia, is sometimes called the Balaeric sea, or sea of Majorca or of Valencia; by some it is divided into the Iberic, Sardic, and Gallic seas, the last including the Gulf of Lyons. The body of water between the above named islands and Italy is known as the Tyrrenhian sea, also called the Ligurian, Tuscian, or Italian. The Sicilian sea washes the island of Sicily on the south, and joins the Ionian sea, embraced between south Italy and Greece, and communicating through the strait of Otranto with the Adriatic. On the opposite side the African coast is indented by the gulf of Libya, with the Greater and Lesser Syrtis of the ancients. Between Greece and Asia Minor lies the Aegean sea or Archipelago, the White sea of the Turks, whence the Hellespont or strait of the Darda-
nelles leads into the sea of Marmora (the Pro-
pontis of the ancients), which communicates
through the Bosporus or strait of Constantino-
polis with the Black sea or Euxine, the latter in
its turn communicating through the strait of
Yenikale or Kertch (the Cimmerian Bosporus
of the ancients) with the sea of Azov. The
eastern part of the Mediterranean bears among
sailors the general name of the Levant; it was
formerly subdivided into the Pamphilian, Sy-
rian, and Phœnician seas.—Five large islands
and a great number of smaller ones are scat-
tered through the Mediterranean. The former
are Corsica, Sardinia, Sicily, Candia or Crete,
and Cyprus. They are all mountainous, the
summits rising to considerable heights. The
principal of the smaller islands are the Balearics
with Palma and Formentera, the Tuscan islands
between Corsica and the Italian mainland, the
Lipari or Æolian islands, Malta and its smaller
neighbors, the Ionian islands, the Dalmatian
islands in the Adriatic, and the islands of the
Archipelago (the Cyclades and Sporades of the
ancients), the largest of which are Negropont
(Eubea), Rhodes, and Samos. Volcanic phe-
nomena are well developed in southern Ita-
ly and Sicily, where Vesuvius and Etna are
frequently active, and Stromboli in constant
eruption. In the Archipelago the island of
Santorin is a partly submerged volcano, occa-
sonally active and forming new islets. (See
GRAHAM ISLAND.) Only four rivers of impor-
tance empty into the Mediterranean: the Ebro,
Rhône, and Po on the N. shore, and the Nilé
in Egypt. Besides these may be mentioned
the Guadalaviar, Tiber, Adige, Marita, Men-
deron, and Orontes.—The Mediterranean is no-
ted for its bright and deep blue color, when
undisturbed, though probably it does not differ
much from the ocean in that respect. Prof.
Tyndall attributes this tint to minute particles
in suspension, the existence of which he proved
by optical experiment. Carpenter found by
filtration that these particles were inorganic,
and much more abundant than in the Atlantic.
According to Admiral Smyth, a greenish tinge
is prevalent in the Adriatic; it borders on pur-
ple in the Levant basin, while the Black sea
often has the dark aspect from which it derives
its name.—The eastern basin is very deep; S.
E. of Candia 1,600 fathoms have been sounded,
and in a line from Candia to Malta the greatest
depth is about 2,000 fathoms. The alluvium of
the Nile forms a submarine promontory in
front of the delta. In the Archipelago the
islands rise steeply out of deep water, as much
as 600 fathoms being found between them.
The Adriatic is shallow in its northern part, but
in the south has a depression of 500 fathoms.
The bottom of the Sicilian sea forms a plateau
of less than 500 fathoms, with several shoals.
The depth of the Tyrrenian sea is probably
great, though not known in much detail. The
Balearic sea reaches 2,000 fathoms in its deep-
est parts, the bottom rising toward the strait of
Gibraltar, which measures a little more than
900 fathoms in its deepest part.—Although
the Mediterranean is usually said to be tide-
less, this is not strictly true; tidal motions
are noticed in several localities, though small
and irregular, and modified by the force and
direction of the wind. The Atlantic tide wave
can be directly followed but a short distance
along the coast of Spain; on the coasts of
France and Italy a small rise and fall occurs,
though not regular enough to be formulated
in the absence of accurate observations. In
the strait of Messina the tidal current, accord-
ing to Admiral Smyth, runs alternately six
hours north and six hours south, though the
vertical rise and fall is only a few inches. In
the Adriatic the tide is felt sensibly at Venice,
but is exceedingly weak in the southern part.
On the coast of Africa, Admiral Smyth has
observed tides fairly developed in the Lesser
Syrtis. A connected study of the tides of the
whole basin by means of good instruments,
such as modern self-registering tide gauges, is
still a desideratum. The local currents of the
Mediterranean are partly tidal, and partly due
to the winds. At the strait of Gibraltar, how-
ever, a strong and constant current runs in
from the Atlantic, which cannot be attributed
to either of those causes, which merely modify
it. This current occupies the middle of the
channel, and has a mean velocity of 3 or 4 m.
an hour. On either side of it a tidal current
is observed, which runs alternately with and
against the main current. The true cause of
the latter has given rise to much speculation
among physicists. That it is due to the evap-
oration in the Mediterranean being in excess
of the river supply has been generally admit-
ted; but this would imply a constant increase
of salinity, unless this increase were kept in
check. An undercurrent carrying out the den-
ser water had to be almost necessarily admit-
ted; but its actual existence was not proved un-
til the expedition of Prof. Carpenter, in the
brig of the Porcupine, showed it conclusively.
This physiologist has observed that the water
of the Mediterranean contains more salt than
that of the Atlantic, that this excess of salinity
is greater in bottom water than at the surface,
and that in the strait of Gibraltar this denser
water flows out into the Atlantic, thus resto-
ing the equilibrium of density between the two
seas. Observations in the Hellespont and Bos-
porus have shown that a surface current flows
out of the Black sea, and an undercurrent in.
The relation of densities is here reversed, the
Black sea having the least; but the evaporation
being less in proportion to the river supply,
the current is due less to a restoration of level
than to the difference of densities.—The pre-
vailing winds are mostly from the north and
west. Some of them are known by specific
names, such as the mistral, a cold wind blow-
ing from the Alps along the valley of the
Rhône to the sea; its opposite, the sirocco, a
scorching hot wind carrying the dry heat of
the African deserts over Sicily and all Italy;
and the bora (Boreas of the ancients), a north wind usually accompanied by terrible thunderstorms. These winds, with waterspouts, which are very frequent, especially in the western basin, render the navigation of the Mediterranean rather dangerous during certain seasons. One of the peculiarities of the Mediterranean is the frequent occurrence of remarkable electrical phenomena, known as the St. Elmo's fire, being balls of fire playing in mid air around the masts of ships, and called by the ancients Castor and Pollux. — The diminution of the temperature of the water with the depth follows entirely different rules in the Mediterranean from those found in the open ocean. Dr. Carpenter's observations have shown that the surface temperature, variable according to the season, so that, in summer, falls gradually to 64° or 56° at a depth of 100 fathoms; below this depth no further diminution is observed down to the greatest depths at which observations were made (1,743 fathoms). This represents the constant temperature of the great body of water occupying the Mediterranean basin, the upper 100 fathoms alone being influenced by the sun's rays. In the ocean the cold influx from the polar regions underlies the warmer strata, and reduces the bottom temperature to about 38° even under the tropics. To this influx a barrier is opposed by the comparatively shallow ridge in the strait of Gibraltar. The uniform temperature of so large a mass of water in a nearly closed basin implies an almost entire absence of circulation and probably of acretion; hence a great scarcity of organized life on the bottom in great depths, in fact an almost entire absence of it when compared with the ocean. (See ATLANTIC OCEAN, and DREDGING.) The dredging of the Porcupine showed that, except near the coast, the bottom consists of a tenacious mud, composed of fine yellowish sand mixed with a bluish clay, the proportions varying according to localities. It yielded nothing but fragments of shells and a few foraminifera. On the generally rocky bottom nearer shore the dredge brought up richer harvests. — The fauna of the Mediterranean presents a number of northern types whose occurrence has been attributed to a former direct communication between it and the Bay of Biscay, which geology shows to have been closed since the eocene period. A few cetaceans and one species of seal inhabit this sea, but are of no commercial importance; the same remark applies to the loggerhead and leather turtles. The tunny, the sardine, and the anchovy among fishes form important articles of trade. Of the lower animals, mollusks, crustaceae, and even radiates, all that are possibly edible are used as articles of food by the inhabitants of southern Europe. The red coral is found on deep water in most parts of this sea, but the principal fisheries are carried on along the coasts of Algeria, Tunis, and Sicily. The pink variety comes chiefly from that region, while the deep red coral is more prevalent on the east coast of Spain. The finest variety of sponge (the so-called Turkey sponge) is obtained chiefly in the Archipelago and in the Adriatic. In the latter the Austrian government has recently tried its artificial propagation with success. — The shores of the Mediterranean have been the nursery of civilization, the cradle of which was further east. The nations that early established themselves on its borders, particularly on the indented and diversified northern ones, founded there centres sufficiently isolated to foster national feelings, and at the same time near enough to their neighbors for frequent and easy intercourse. Thus commercial relations were early established between Egypt, Phoenicia, Greece, and Rome, carrying with them arts and literature, and developing these very early to a standard which still serves us as a model. The Roman empire brought the entire coast of this sea under its sway, rendering it thus an open channel for the spread of Christianity from the land of its origin toward the west, where it was to receive its highest development. Afterward the Mohammedan religion overspread the eastern and southern shores, and ultimately covered them with comparative darkness, in which the light of modern progress is but slowly beginning to penetrate at a few points.

MEDJIDIEH, a new town of European Turkey, in the Dobrudja, 23 m. W. by N. of Kustendji, on the railway connecting Kustendji with the Danube; pop. about 25,000. Before 1860 the place was only a village; it owes its rapid growth to the immigration of Tatars from Russia. Some hundreds of them came to Kustendji after the Crimea war. They were employed upon the railway then in process of construction, and afterward, by the care of the English engineers, received free transportation to Medjidieh. The geographical advantages of the place soon attracted a large immigration, and in 1862 there were living in the town and its vicinity from 40,000 to 50,000 Tatars, greatly outnumbering the Turkish population, and distinguished for the number and excellence of their cattle, while they also raised great quantities of wheat for export. Medjidieh, named after the sultan Abdul Medjid, became the capital of the province.

MEDLAB, a fruit-bearing tree of the order rosaceae, common in the wild state in most parts of Europe, some of the finer varieties of which are cultivated. In most works the medlar is placed in a separate genus as mespilus Germanica, but Hooker and Bentham in their new Genera Plantarum unite it with pyrus, from which it only differs botanically in having hard and bony carpels to the fruit. The medlar is a large shrub or small tree, usually with very crooked branches, simple leaves, and flowers resembling those of the pear; the fruit in the cultivated kinds is about ½ in. in diameter and broader than long; at

MEDITERRANEAN SEA

MEDLAR
the top of the fruit is a broad hairy disk, surrounded by the calyx lobes, which remain green and leafy until the fruit is nearly mature; when ripe the skin of the fruit is brown, and the flesh firm and austere; the fruit is only eatable after having been kept until the first stage of decay, called bletting, has thoroughly softened the flesh to a pulp; in this state the medlar is highly prized by some, who are fond of its rich subacid flavor, but it is not regarded as a popular fruit. Of the varieties, that called the large Dutch is preferred; the trees are propagated by grafting upon seedling medlars or upon the pear and thorn. The plant has been used for hedges, and it is sometimes set as an ornamental tree where the effect of rusticity is desired. It is very seldom cultivated in this country. — The Japan medlar (Crispata japonica) of most authors, but by Hooker and Bentham reduced to Photoina), also known by the Chinese name of loquat, is a favorite ornamental tree in our warmer states. It is largely cultivated in Japan and China, and was introduced into Europe nearly a century ago. In its native country it forms a large tree; its large evergreen leaves are rough, bright green above, and downy beneath; the flowers, produced in autumn, are in large terminal spikes, and pleasantly fragrant; the fruit, which ripens the following spring, is of the size of a small apple, oval, pale orange with a blush of red, and an orange-colored subacid pulp resembling an apple in flavor. The tree does not produce fruit in the north of Georgia, but has done so in Louisiana; wherever it will endure the winter, it is a valuable tree both on account of its handsome foliage and its late season of blooming.

**MEDOC.** See France, Wines of.

**MEDUSA, in mythology.** See GOARONS.

**MEDUSA, in zoology.** See JELLY FISH.

**MEDWAY (anc. Vaga),** a river of England, which rises in the S. E. part of Surrey, traverses Kent, flowing mainly E. and N., and falls into the estuary of the Thames at Sheerness near its mouth. It is about 60 m. long, and navigable to Penshurst, 40 m. In its lower course it expands into a broad, deep tidal inlet, and a little above its embouchure it sends off a navigable branch on the right called the East Swale, which cuts off from the mainland the isle of Shephey. The Medway is one of the most important havens for the British navy, and on its banks are two large government dockyards, Sheerness and Chatham. Ships of the line can anchor in the channel as far up as Maidstone.

**MEEK, Alexander Beaufort,** an American author, born in Columbia, S. C., July 17, 1814, died in Columbus, Miss., Nov. 80, 1865. He graduated at the university of Alabama, was admitted to the bar in 1835, and in the same year became editor of a newspaper at Tuscaloosa. He served as a lieutenant of volunteers against the Seminoles in 1836, and at the close of the campaign was appointed attorney general of the state, but soon resigned this post and resumed his practice. He was judge of the county court from 1842 to 1844, during which time he prepared a supplement to Aiken's "Digest of Alabama." From 1848 to 1852 he was associate editor of the "Mobile Register." He was elected to the legislature in 1853, and secured the establishment of a free school system in the state. He was a presidential elector on the democratic ticket in 1856, was again elected to the legislature in 1859, and was chosen speaker of the house. He published "Romantic Passages in Southwestern History," and "Songs and Poems of the South" (New York, 1857), and left an unfinished "History of Alabama."

**MEEKER, a S. central county of Minnesota, watered by Crow river, and containing numerous small lakes; area, 558 sq. m.; pop. in 1870, 6,090. The surface is rolling, consisting mostly of fertile prairies. It is traversed by the St. Paul and Pacific railroad. The chief productions in 1870 were 135,147 bushels of wheat, 28,974 of Indian corn, 92,532 of oats, 10,492 of barley, 39,913 of potatoes, 142,771 lbs. of butter, and 15,329 of hogs. There were 963 horses, 1,871 milch cows, 3,837 other cattle, 2,936 sheep, and 2,687 swine; 4 flour mills, and 4 saw mills. Capital, Litchfield.

**MEERANE, a town of Saxony, in the circle and 9 m. N. by W. of the city of Zwickau; pop. in 1871, 19,187. In 1858 the population was 11,147. The increase is due to the progress in the production of woollen and semi-woollen goods. The town contains upward of 100 manufactories of such goods, the exports of which are valued at about 15,000,000 thalers annually. Plum, dyestuffs, and other articles are also made here. It once belonged to Bohemia, and became part of Saxony in 1779.

**MEERSCHAUM (Ger., sea foam, so called from its lightness and whitish appearance), or Magnesite, a hydrous silicate of magnesia, of composition represented by the formula MgO, SiO₂ + 2H₂O. It is a mineral of soft earthy texture somewhat resembling chalk, of hardness 2.5, and of variable specific gravity. It is found in Spain and several countries at the
MEERUT

MEGALONYX

head of the Mediterranean, occurring in the form of veins in serpentine, and also in tertiary deposits. Dr. J. Lawrence Smith found it in Asia Minor in alluvium, apparently the result of the decomposition of carbonate of magnesia belonging to neighboring serpentine rocks. It is largely collected there for the manufacture of pipes and cigar tubes, the town of Konieh furnishing the principal supplies. It is roughly shaped into blocks, or sometimes into rude forms of pipes, for exportation, and freed as far as practicable from the associated minerals, which impair its quality by interfering with the carving and smoothing of its surface. It is fashioned into finished pipes, which are often highly ornamented, in different cities of Europe. Pesth and Vienna are famous for this manufacture. To produce the yellow and brown colors, which are much admired in the pipes, and which are brought out only after long smoking, the blocks are kept for some time in a mixture of wax and fatty matters. A portion of these is absorbed, and, being subsequently acted upon by the heat and the tobacco fumes, assumes various shades of color. The lightest qualities are too porous for producing the best pipes; and the heaviest are rejected from suspicion of their being artificial products. These artificial preparations are from the parings of the genuine material, which, being reduced to fine powder, are boiled in water and moulded into blocks, sometimes with the addition of clay. After drying and contracting, they are ready for carving. This kind is known by the name of Massalopoe or massa bowls. The artificial meerschaums cannot easily be distinguished from the real; but they are generally heavier, and are more free from blemishes, some of which, arising from the presence of foreign minerals, are often seen in the genuine meerschaums.

MEERUT. I. A district of British India, in the Northwest Provinces, forming part of the Doab, and bounded E. by the Ganges and W. by the Jumna; area, 2,382 sq. m.; pop. in 1871, 1,271,454, of whom about 900,000 were Hindoos. A ridge of low hills traverses the district from N. to S., separating the valleys of the Ganges and Jumna, but the surface is generally remarkably level. The soil is abundantly watered by the Ganges and Jumna, and by the Ganges canal, about 50 m. of which lies in the district. The vegetation of the tropics alternates here with that of more northern latitudes, wheat being cultivated in the cool season, and sugar cane, indigo, and cotton in the wet. Apples, peaches, mangos, and strawberries abound. The climate is one of the finest in India. II. A city, capital of the district, on the river Kalee Nudde, nearly equidistant from the Ganges and the Jumna, 820 m. N. W. of Calcutta, and 40 m. N. E. of Delhi; pop. about 30,000. The streets are narrow and dirty, and the native part of the town is wretchedly built, though it contains some ruined mosques and pagodas of considerable architectural interest. It is an important military station, having an extensive cantonment about 2 m. distant. The English church, which is capable of holding 5,000 people, is one of the finest in India. In the beginning of the sepoy rebellion, one of the most serious outbreaks occurred at Meerut. The town contained at that time about 4,500 troops, nearly half of whom were Europeans. The native soldiers showed insubordination as early as April, 1857; and on May 9, 85 troopers were imprisoned for refusing to receive the new cartridges. On the next day, Sunday, the comrades of these men and the sepoys of the 20th native infantry rushed from their lines on a given signal and proceeded to the quarters of the 11th native infantry, whose colonel fell riddled with balls while endeavoring to persuade them to return to duty. The 11th now joined the rebels, the imprisoned troopers were released, 1,200 riffians were let loose from the jail, and the mutineers and the rabble set fire to the cantonment and murdered every European who fell in their way. The English troops were badly managed, and the rebels escaped them and marched to Delhi.

MEGALONYX (Gr. μεγαλόνυχ, μυδήθων, great, and ὄνυξ, claw), an extinct genus of giant edentates, allied to the sloths, established in 1797 by Thomas Jefferson, in a communication to the American philosophical society of Philadelphia, in whose "Transactions" the bones were described by Dr. Caspar Wistar, who first suggested the affinity of the animal to the recent sloths. The first bones were discovered in a limestone cavern in western Virginia, and were referred by Mr. Jefferson, from the large size of the claws, to some carnivorous animal; the original specimens of this, the M. Jeffersonii (Harlan), are in the cabinet of the academy of natural sciences at Philadelphia. These, and other bones found in Tennessee, Kentucky, Mississippi, and Alabama, form the materials of the most complete monograph on the subject, that of Prof. Joseph Leidy, in vol. vii. of the "Smithsonian Contributions to Knowledge" (1855). The skull is about 14 in. long, with the upper outline nearly horizontal, depressed forehead, and convex nose; the sagittal crest prominent and rugged; zygomatic process strong, and temporal fossa rough for the attachment of muscular fibres; the mastoid process strongly marked; the orbital cavity shallow; the hard palate between the three posterior molars 14 lines wide, with a median convexity nearly as prominent as the teeth, becoming almost plane in advance of the third molars, and varying in width from 2½ to 4 in., perforated by large foramina and by a large incisive foramen between the first molars; the occipital foramen circular, 16 lines in diameter, the surface of the foraminal bone being rough for the attachment of powerful muscles; orifice of nose irregularly circular, about 3 in. in diameter; lower jaw about 13 in. long. The teeth are long, without fangs, sub-elliptical, of nearly uni-
form diameter, with the crown hollowed in the middle, and projecting border; as in other edentates, they are deeply excavated from the bottom for the persistent dental pulp; they have no enamel, being composed of very porous dentine in the centre, surrounded by a harder layer of the same which is enclosed by a thinner crust of cementum; the formula is $2 \times 2$, the anterior tooth being considerably in advance of the others, in form and position like a canine; they vary in diameter from 8 lines to an inch; the rami of the lower jaw are widely separated, and the symphysis narrow. The bones of the skeleton are strong, though less so than in the allied megatherium; the scapula is about $\frac{1}{2}$ ft. long, the humerus 20 in.; the thigh bones are relatively shorter and broader than in the sloths and about 21 in. long; the tibiae relatively very much shorter than in the sloths, but of greater relative length than in the mylodon; the shaft of the humerus suddenly expands toward the lower extremity, and is pierced by a large foramen; the astragali like that of recent sloths, $\frac{5}{4}$ by 3$\frac{1}{4}$ in.; the heel bone developed in an extraordinary manner, being long, compressed, and high; the phalanges large and narrow, and armed with powerful claws; the tibia and fibula distinct, and the foot articulated obliquely, the last leading Mr. Lund to the opinion that the animal was a climber; the anterior limbs a little longer than the posterior; the tail strong and solid. From the study of the toes Cuvier pronounced the animal an edentate; the well marked ridge in the middle of the articulating surface of the last phalanx indicates a more restricted motion than in carnivora, to which Mr. Jefferson referred it; the upper edge extends further back than the lower, preventing the claws from being raised above a horizontal line, but permitting complete flexion below, as in sloths; their form and proportions are also those of edentates; the middle and third fingers are large, with very strong claws, the index being smaller with a less strong claw, and the thumb and little finger rudimentary. This animal was less heavy in form than the megatherium, which it doubtless resembled in its habits; it was probably of the size of a large ox. The bones are found in the pleistocene or drift formations of America, contemporaneous with the elephant and mastodon, and perhaps surviving them; bones of another species are found in Brazil. (See Megatherium.)

MEGALOPSIS, a city of ancient Greece, originally capital of the Arcadian confederation, on the river Helisson. It was founded at the suggestion of Epanmoridas, after the battle of Leuctra (371 B.C.), and was designed by him as a check to Sparta. Forty townships furnished inhabitants for the new city, which was 6 m. in circumference, and had a larger domain allotted to it than that possessed by any Arcadian state. But it never attained the importance anticipated for it, and was too large for its population, that of its entire territory being but 65,000. Apprehension of Sparta afterward drove the Megalopolitans into alliance with the Macedonians, and held them aloof from the coalition formed in Greece on the death of Alexander for the recovery of independence. They at length fell under the dominion of tyrants, the last of whom, Lydiades, resigned in 234, and united Megalopolis to the Achaean league. In 222 Cleomenes III., king of Sparta, captured it by surprise, and destroyed the greater part of it; but after his defeat at the battle of Sellasia (221) the Megalopolitans who had fled returned under the conduct of Philopemen, and rebuilt the city on the original scale; but it never regained its former prosperity, and rapidly sank into insignificance. It contained no acropolis, owing to its flat situation, but a magnificent agora, colossal statues, and famous temples. Little remains of this great city, which used to be called the great desert, owing to its magnificent distances, excepting the well preserved ruins of the theatre, which Pausanias regarded as the largest in Greece; and they are still visible amid the thickets and corn fields which cover the site of the city near the village of Sinano.

MEGALOSAURUS (Gr. μεγάλος, great, and σαῦρος, lizard), a gigantic fossil reptile of the family of dinosaurs, which includes the ignanodon, previously described. This family, entirely extinct, was remarkable for great size and for certain mammalian characters; the long bones have a medullary cavity, the feet are short and pachyderm-like, the sacrum composed of at least five anchylosed vertebrae, the ribs doubly articulated to the spine, the vertebral lamina greatly developed, and the lower jaw capable of a horizontal triturating motion; but the teeth, scapular arch, and most of the skeleton resemble those of lizards. The genus megalosaurus (Buckland) was discovered by Dr. Buckland in the Stonesfield oolite near Oxford, Eng.; remains have also been found in the Wealden and Jurassic formations. The M. Bucklandi
MEGANTIC, a S. E. county of Quebec, Canada, watered by the Bécancour river; area, 7,484 sq. m.; pop. in 1871, 18,879, of whom 12,074 were of French, 4,444 of Irish, 1,302 of Scotch, and 963 of English origin or descent. It contains Lakes Joseph and William, and is traversed by the Grand Trunk railway. Capital, Leeds.

MEGARA, a city of ancient Greece, capital of Megaris, about 1 m. from the Saronic gulf, opposite the island of Salamis, 20 m. W. by N. of Athens. It consisted of a double acropolis and the city proper. The more ancient acropolis is said to have been built by Car, son of Phoroneus; the other, together with the city, by Alcathous, son of Pelops. Subsequently a Dorian colony, under Aletes and Athenemes, took possession of the city, and enlarged it. Its original name appears to have been Polichne. In the 8th and 7th centuries B. C. Megara was opulent and powerful, and founded the colonies of Megara Hyblia in Sicily, Astacus in Bithynia, and Chalcedon and Byzantium on the Bosporus. In the time of Solon it entered into a contest with Athens for the island of Salamis, but without success. In the Persian war it contributed 3,000 heavy-armed troops and 20 ships to the confederate forces. After that struggle Megara left the Peloponnesian confederacy for that of Athens, to which ere long it became virtually subject; and the Athenians, to secure their supremacy over it, built the long walls which connected Megara with its port Nisaea. The Athenian garrison, however, was expelled by the aid of Peloponnesian troops in 445. The Athenians retaliated by excluding the Megarians from their markets and harbors, which decree operated so injuriously to the interests of the latter that its enforcement was one of the pretexts of the Spartans and their allies for the Peloponnesian war. During that war Megara suffered severely from siege and famine, the Athenians being still in possession of Nisaea; and subsequently, though it partly recovered its prosperity, it ceased to be prominent in history. It was celebrated for its philosophical school, founded by Euclid, the disciple of Socrates. It contained noted public buildings, of which few traces remain. The present little town of Megara, which is the capital of the nomarchy of Attica and Boeotia, is dilapidated. A ferry connects it with Salamis.

MEGARIS, a district of ancient Greece, bounded N. by Boeotia, E. by Attica, S. by the Saronic gulf, and W. by Corinth and the Corinthian gulf; area, about 143 sq. m. It is in general rugged and hilly. The principal mountains are Mt. Cithaeron, which separates it from Boeotia, and the Geranean chain, which extends E. and W. across its S. part from sea to sea. Through this chain are three passes: one, the Seirionian pass, runs by the Saronic gulf, and formed the direct road from Corinth to Athens; another, which runs along the Corinthian gulf, was the great thoroughfare between the cities of the Peloponnesus and Athens, and crosses the centre of the mountains. The territory of Megaris contains no plain except that of its metropolis. The earliest inhabitants were Αἰολians and Ionians, and it originally constituted part of Attica. The present eparchy of Megaris (pop. about 12,000) forms part of the nomarchy of Attica and Boeotia.

MEGASTHENES (Gr. μεγασθένης, great, and αἴθιος, strength), a name given by Dana to one of the grand divisions of the non-marsupial or higher mammals, as indicating a superior type, based on a larger and more perfect plan of structure. This division includes the monkeys, carnivora, herbivora, and cetaceans. He has given the name of microsthenes (μικρός, small, and αἴθιος, strength) to the inferior, based on a weak type of structure; this division includes the bats, insectivora, rodents, and edentates. The marsupials and monotremes constitute the still lower division of semi-oviparans or oothecoids; and man forms alone the highest or fourth division, the archonts. The parallelism between the megatheres and the microsthenes he, according to him, complete; the bats in the latter represent the monkeys in the former; the insectivora represent the carnivora, the rodents the herbivora, and the edentates the cetaceans.

MEGATHERIUM (Gr. μεγαθερίων, great, and θηρίον, animal), an extinct edentate animal, of gigantic size, coming in many respects near to the sloth family, and with its allies, the megalonyx and mylodon, seeming to form the transition from the edentates to the proboscidea. Pictet calls the family gravirades, placing them between the sloths and the armadillos; in all the molar is hollow cylinders of dentine and cement without enamel, the tube of dentine being filled with a porous substance; the form of the head, which is short and truncated, the large descending zygomatic process, and many parts of the skeleton (as the union of the acromion and coracoïd processes of the scapula), resemble those of the sloths; the teeth consist only of molar, the canines of the teeth being absent; in their heavy forms, nearly equal limbs, and long and strong tail, they
come nearer the armadillos and ant-eaters. The genus *megatherium* (Cuv.) is the first described of the family, the first skeleton having been sent in 1789 from the vicinity of Buenos Ayres to Madrid, where it now remains; since then other skeletons and frag-
ments have been discovered in Peru, Paraguay, and other parts of South America; another species is described by Dr. Leidy in North America. This genus is distinguished from the other megatheroids by the quadrangular prismatic form of the teeth and the marked transverse ridge on the crown; the dental formula is 4-4; the anterior limbs have four fingers, the posterior only three, the two outer being without nails, the others with large claws. The well known South American species, *M. ouvleri* (Desm.), is intermediate in size between the elephant and the rhinoceros; the skull is relatively longer than in sloths, and the large foramina for the passage of nerves and vessels indicate that the animal had very thick lips; the teeth, from 7 to 9 in. long, are implanted deeply in firm alveoli, and the ridges of the upper fit into the depressions of the lower; the lower jaw is large and heavy; the vertebrae are 7 cervical, 16 dorsal, 3 lumbar, 5 sacral, and 15 caudal, of medium size in the anterior portions of the body; those of the tail are enormous, the largest measuring 18 in. from one end of the transverse process to the other; the V-shaped bones are also greatly developed, the tail serving as a means of support and perhaps of defence; the ribs are short and thick, and roughened for muscular attachments. The anterior limbs are remarkable for the strength of the shoulder, the clavicle being massive and curved like the letter S, and the acromion and coracoid processes united; the humerus is much enlarged at the lower portion to support a wide ulna and a radius freely turning around it, as in the monkeys and sloths; the large processes indicate immense force of rotation; the fore feet were strong, and armed with powerful claws. The pelvis is very large and solid, measuring 4½ ft. from hip to hip, considerably more than in the largest elephant; the cotyloid cavity is directed downward, so that the thigh bones support the body without obliquity, securing great strength and solidity at the expense of rapidity of motion; the thigh bones are at least three times as thick as in the largest elephants, and the length is only double the width; the tibia and fibula are very thick, and united at the top; the heel bone is almost as long as all the rest of the foot, and the nail of the middle toe enormous. These details suffice to show that the megatherium was very large and powerful; the entire fore foot being about a yard long and the claws set on obliquely to the ground, it may be inferred that the anterior limbs were principally used for digging; the great size of the pelvis and hind legs, and strength of the tail, were necessary to sustain so heavy an animal in an upright position while using its fore feet in digging around the trees which it afterward prostrated by the weight of its body. The teeth show that it was herbivorous, feeding on the stems and roots of trees and succulent fruits. Their size and structure indicate that they did not burrow under ground like the mole, nor climb trees like the sloth, nor dig up roots or ant hills like the armadillos and ant-eaters, but loosened and cut the roots of trees with their powerful claws, and then, supported on the hind limbs and tail, pulled them down with the fore limbs aided by the great weight of the body. Like the living sloths, this species was limited in geographical distribution to South America, in the alluvial deposits of which, on the pampas, their bones have principally been found. Dr. Leidy, in vol. vii. of the "Smithsonian Contributions to Knowledge" (1855), describes a North American megatherium (*M. mirabile*, Leidy), discovered in the maritime portion of Georgia and on the shores of Ashley river, South Carolina, in connection with bones of the elephant, mastodon, horse, and ox; it is now preserved in Washington and Philadel-
defeated them near Soot when the arrival of a British expedition at Alexandria, March 17, 1807, consisting of 5,000 men under Gen. Fraser, led him to conclude a truce with the beys, and to promise to comply with all their demands if they would cooperate against the invaders. Most of them agreed to his proposals, and were marching against the British, when Gen. Fraser, who had been already several times defeated by the pasha's troops and had lost about 1,000 men, retreated and left the country, Sept. 14. Many of the beys now took up their abode in Cairo, and for three or four years Egypt was comparatively tranquil, notwithstanding occasional battles between the Mamelukes and the pasha's troops, in one of which the latter was signally beaten. At length, on March 1, 1811, Mehemet Ali enticed all the Mamelukes in Cairo into the citadel on pretence of witnessing the ceremony of investing his son Tusun with the command of an army to be sent against the Wahabees in Arabia. The gates of the fortress were then closed upon them, and they were killed to the number of 470. Immediately afterward the pasha's officers and soldiers throughout Egypt massacred all the Mamelukes within their reach. The few who escaped fled to Nubia, where they dwindled away till the corps became extinct. These energetic proceedings established the power of Mehemet Ali, and gave to Egypt an internal tranquillity unknown for ages, and which has lasted to the present time. Tusun Pasha was now sent with 8,000 men against the Wahabees, from whom he recaptured the sacred cities of Mecca and Medina, and whose leader he took prisoner. He subsequently met with disasters, and in 1813 Mehemet himself went to Arabia to conduct the war. He was successful, and in 1815 returned to Egypt after concluding a treaty with the Wahabee chiefs. He now made an attempt to introduce European discipline into his army; but a formidable mutiny breaking out in consequence, he temporarily abandoned his design. The Wahabees not having fulfilled the conditions of the late treaty, he sent his son Ibrahim against them in 1818, with an army composed in part of the recent mutineers. The expedition succeeded in capturing El-Derayeh, the Wahabee capital (1818), and in suppressing all armed opposition in Arabia to the sultan's power. Mehemet Ali now turned his attention to the improvement of manufactures in Egypt, and to the revival of the commerce of the country. He also caused the construction, at an enormous sacrifice of the laborers from sickness and want, of a great canal from Alexandria to the Nile. In 1820 his youngest son Ismail was sent with an army to conquer Sennaar, and to collect captives to be sent to Cairo with the view of forming them into an army in the European manner. Sennaar, Dongola, and Kordofan were subdued: and although in 1822 Ismail was surprised and with his retinue burned alive by a native chieftain, these prov-
MEHEMET ALI

inere have since remained subject to Egypt. The revolts taken in Sennar and Kordofan were suppressed by French officers, and in 1823 the army thus organized amounted to 24,000 men. In 1824 Ibrahim Pasha was sent with a powerful fleet to assist the Turks in suppressing the Greek insurrection. The fleet was engaged at Navarino (1827), and Ibrahim supported the contest till in 1828 the European powers compelled him to evacuate the Morea. In 1851 Mehemet Ali sent an army of 38,000 men into Syria under command of Ibrahim. This step brought him into immediate conflict with his suzerain the sultan, to whom he still professed allegiance. Ibrahim took Acre after a long siege, and rapidly overran Syria, defeating the Turks in a great battle at Homs in July, 1832. He then advanced into Asia Minor, and at Konieh encountered the grand vizier Reshid Pasha with 60,000 men, his own army being less than 30,000. The Turks were routed, Reshid was made prisoner, and Ibrahim was within six days' march of Constantiople, when the European powers intervened and compelled Mehemet Ali, in May, 1853, to accept a treaty by which the whole of Syria and the district of Adana in Asia Minor were ceded to him, besides the island of Candia, which he had formerly received for his services in Greece. The sultan was not disposed to submit quietly to the losses inflicted by his rebellious vassals; and in June, 1839, after long preparation, the Turkish fleet sailed for Egypt, and an army of 80,000 men commanded by Haliz Pasha invaded Syria. It was met by Ibrahim with 46,000 men at Nizib, June 24, and utterly routed in less than two hours. Hardly had the news of this triumph reached Alexandria when the Egyptian fleet entered that port, bringing with it the whole Turkish fleet, which had through treachery surrendered without a battle. The Turkish empire was again preserved from destruction by the intervention in 1840 of Great Britain, Russia, Austria, and Prussia, although France, under the short ministry of Thiers, strongly favored Mehemet Ali. Alexandria was blockaded, and a British fleet bombarded and captured Beyrouth and Acre. Terrified by these vigorous demonstrations, Mehemet Ali early in 1841 accepted terms of peace dictated by the allies, by which the pashalic of Egypt was secured to him and his descendants, on condition of paying one quarter of his clear revenues to the sultan as tribute, restoring to him his fleet and the Syrian provinces, and limiting his own army to 18,000 men. Henceforth Mehemet Ali devoted himself to the internal improvement of Egypt. The administration of the government was reformed on European models and under European advice. With few exceptions all former usages were destroyed, and an entirely new system of government was formed. Cotton was largely cultivated, and many extensive manufactures were created. In 1847 Mehemet Ali for the first time visited Constantinople, where he was well received, and had the rank of vizier conferred upon him. In 1848 he became imbecile from age, and his son Ibrahim was appointed viceroy in his stead; but the latter died two months afterward while his father yet lived, and was succeeded by his nephew Abbas Pasha.

MEHUL, Etienne Henri, a French composer, born at Givet in the Ardennes, June 24, 1763, died in Paris, Oct. 18, 1817. He was of humble extraction, and having shown a strong taste for music was taken to Paris at the age of 16, and instructed by Gluck. He wrote three or four entire operas, but did not appear before the public as a composer until 1790, when his Euphrosine et Coradin, for which Hoffmann wrote the text, was produced with great success. His Stratonice (1792) established his reputation, and his national hymn, Le chant du départ, after Chénier's text, gave him a wide popularity, and was followed by similar songs. Critics complained of a lack of graceful melodies in his operas, and of a dryness and monotony in the harmony and accompaniments. In his opera Othai (1806), a work of great vigor written upon an Ossianic subject, he excluded the violins from the orchestra, substituting the violas. In his masterpiece, Joseph (1807), he vindicated his claim to be ranked among great composers, and it has frequently been performed in England as an oratorio. He composed in all 42 operas, besides ballet music and instrumental pieces, including the Ouverture du jeune Henri, an admirable specimen of descriptive music. He was a member of the institute, an inspector of the conservatory, and professor of composition at the royal school of music and declamation.

MEIGGS, Henry, an American merchant, born in Catskill, N. Y., in 1811. He began business as a contractor in Boston, removed thence to New York, made a fortune in the lumber business, and lost it in the crisis of 1837, but recovered from bankruptcy in two years. In 1848 he sailed in a vessel loaded with lumber for San Francisco, where he sold the cargo for 20 times its cost. He next built a wharf and a saw mill on the bay, and sent 500 men into the woods to fell trees. His immense business was prostrated by the panic of 1854, and to save himself he resorted to irregular proceedings, in consequence of which he departed secretly by sea with his family, Oct. 5. He was next heard of as builder of bridges on the Valparaíso and Santiago railroad in Chili. In 1858 he contracted with the Chilian government to complete the road in four years, for $12,000,000. He finished it in two years, and his net profits were $1,326,000. In 1867 he contracted to build a railway from Mollendo to Arequipa, Peru, which he completed on Jan. 1, 1871, making an enormous profit. He celebrated the event with a dinner which cost $200,000, and distributed $550,000 worth of gold and silver medals. In 1870 he contracted to build six other railways in Peru for $125-
MEISSNER, Alfred, a German poet, born at Teplitz, Oct. 15, 1822. He is a grandson of the voluminous miscellaneous author August Gottlieb Meissner (1763-1807). He studied medicine, taking his degree at Prague in 1846. To elude the Austrian censorship, he published in the same year at Leipsic his famous epic poem Ziska (10th ed., 1867). He long resided chiefly in Paris, and returned to Prague in 1850, where he and Moritz Hartmann were the principal representatives of the liberal school.
of German poetry in Bohemia, a 10th edition of his Gedichte appearing in 1867. Some of his effusions, especially Der Sohn des Atta Troll (1850), abound with the peculiar sarcasm and pathos in which Heine excelled, and he published Erinnerungen an Heine (1854). Among his novels are Zeichen Färö und Volk (3 vols., 2d ed., 1861), illustrating the revolution of 1848; Zur Ehre Gottes (2 vols., 1861); and Schwarzebel (8 vols., Berlin, 1864; popular edition, 1 vol., 1866). His other writings include Charaktermasken (3 vols., Leipzig, 1861-3); Novellen (2 vols., Leipzig, 1864); Die Kinder Rom's (4 vols., Berlin, 1870); and Rococo-Bilder (Gumbinnen, 1871).

MEISSONIER, Jean Louis Ernest, a French painter, born in Lyons about 1813. He studied his art in Paris under Léon Cogniet, exhibited in 1836 his "Little Messenger," and soon acquired a reputation as a painter of miniature subjects of exquisite finish and delicacy. Among his best-known pictures are "The Chess Players," "The Reader," "A Game of Piquet," and "The Skittle Players." Among his larger pictures are "A Charge of Cavalry" (1867), which was sold for 150,000 francs, and is in a private gallery in Cincinnati, and "The Emperor at Solferino" (1864). He has made designs for Balzac's Comédie humaine, "Paul and Virginia," and other works. His pictures bring high prices, and there are several of them in the United States.—Jean Charles, his son and pupil, has attained distinction as a painter, particularly for his portraits.

MEJERDA (anc. Baghradas), a river of northern Africa, formed by several streams which rise in the Atlas mountains in Algeria, and running N. and N. E. to the gulf of Tunis, into which it falls, 24 m. N. of the city of that name. Its whole course is about 200 m., and it is the only considerable river of Tunis. Toward the sea it enters a wide plain whose numerous lakes or ponds seem to have been formed by inundations of the river. Its waters are deeply colored by the soil, and the sediment which it bears down has enlarged its delta and made alterations in the coast line. Its whole lower course has changed, the ruins of Utica now standing close to its left bank. In ancient times it flowed nearer to Carthage.

MEJIA, Tomas, a Mexican soldier, born about 1812, executed in Querétaro, June 19, 1867. He was of pure Indian blood and of humble origin; but he acquired such influence among the natives of the Sierra Gorda of Guanajuato as to be styled the "king of the mountains," and for nearly 20 years he was conspicuous in the Mexican revolutions. He bore an honorable part in the war with the United States in 1847-8, and in 1849 was sent to suppress an insurrection in his native state, headed by Marquez. In 1855 he "pronounced" against Comonfort, but soon submitted. The next year he headed an insurrection in the interest of the church party, and took Querétaro. In 1857 he was second in command of the revolution-
high reputation.—See Boné's Covenent de St. Lazaro à Venise (Paris, 1837).**

**MEKONG, or Cambodia, the chief river of the Indo-Chinese peninsula (Further India), rises near the E. extremity of the main range of the Himalaya mountains, in the S. E. portion of Thibet, flows S. E. through the Chinese province of Yunnan, the E. part of Burmah, Laos, Siam, Cambodia, and French Cochin-China, and empties through several channels into the China sea near Cape St. Jacques; length, about 1,800 m. In the early part of its course, in Thibet and China, it is called the Lan-tsong; the Burmese call it Kin-lung; while the name Mekong, which has now become its most common designation among Europeans, is locally applied to that longest portion lying in Siamese and Cambodian territory. For about 1,000 m. from its source the Mekong flows through nontundal deserts and among some of the most remarkable of the Indian ranges, beginning with the Himalaya proper, and ending with the long chain that extends N. W. and S. E. through the peninsula of Further India. Leaving the main ridge of the latter chain in Laos, in about lat. 18° N., and diverging E. and S. E., it flows through the great central plain of the southern peninsula, irrigating it thoroughly by annual overflows which take place between September and November, and rendering it a region of the greatest fertility. The navigation of the upper river is difficult and dangerous, its bed, even in the widest parts, being obstructed with shifting bars or projecting reefs. Excepting in the lower portion of its course, rapids are frequent. The scenery along the upper Mekong is of the wildest and most rugged character, the stream often flowing through very deep gorges in the mountains, and in some places tunnelling the cliffs into fantastic forms. For some distance from its mouth, however, the river is navigable even for large vessels, and Passing through the capital of Cambodia, is easily reached by shipping from the coast.**—In 1856—8 the Mekong was explored as far as the borders of Burmah by a French government commission, which made an elaborate report upon the river and its valley. See “Travels in Indo-China and the Chinese Empire,” translated from the French of Louis de Carné (London, 1872), and the report of the commission, published in Paris in 1873.

**MELA, Pomponius, a Roman geographer in the time of the emperor Claudius. He was a native of Spain, and is said to have been the first Roman author of a methodical treatise on geography. His work is entitled De Situ Orbis, and consists of three books, which give a brief description of the whole world as known to the Romans. The text is corrupt, but the style is simple and the Latinity pure. The editio princeps appeared at Milan in 1471; the best editions are by Tzschucke (7 vols., Leipsic, 1807) and Fartley (Berlin, 1867).**

**MELAMPUS, in Grecian mythology, son of Amythaon by Idomene, Aglaia, or Rhodope,**

**esteemed the most mortal who was endowed with the gift of prophecy and who practised the medical art. He is said to have introduced the worship of Bacchus into Greece.**

**MELANCHTHON. See INSANITY.**

**MELANCHTHON, Philipp, the second leader of the Lutheran reformation, born at Bretten, in the present grand duchy of Baden, Feb. 15, 1497, died in Wittenberg, April 19, 1560. His family name was Schwarzerd (black earth), but his uncle, the celebrated scholar Reuchlin, translated it into the corresponding Greek Melanchthon. He was educated at the Latin school of Pforzheim, and at the universities of Heidelberg and Tübingen. He was uncommonly precocious, graduated as master of arts in 1514, began to lecture at Tübingen, and published a Greek grammar, an edition of Terence, and projected a new edition of Aristotle’s writings, as a means of achieving true freedom of thought. He took rank at once among the very first Greek and Latin scholars of the age. In 1516 Erasmus said of him: “My God! what expectations does Philipp Melanchthon excite, who is yet a youth, yea, we may say a mere boy, and has already attained to equal eminence in the Greek and Latin literature. What acumen in demonstration, what purity and elegance of style, what comprehensive reading, what tenderness and refinement of his extraordinary genius?” With his classical studies he combined a careful study of the Bible in the original. This, in connection with the influence of Reuchlin, predisposed him favorably to the great movement of the reformation, which commenced during his residence at Tübingen with the controversy between Luther and Tetzel in 1517. On the recommendation of Reuchlin he was called to the professorship of Greek at the rising university of Wittenberg in 1518, and thus became the colleague of Luther. Although he was subsequently called to professorships in Frankfort, Tübingen, Heidelberg, and even France and England, he preferred remaining at Wittenberg to the close of his life. He was the most popular teacher of the university, and attracted students from every direction. At first he lectured on classical literature, but in 1519 he graduated as bachelor of divinity, and thenceforward devoted himself mainly to theology. Yet he was never ordained, nor would he ever accept the title D. D., and in a discourse in 1538 uttered a warning against conferring it too frequently. He never ascended the pulpit, although he frequently wrote sermons for others, and delivered in his house practical lectures on the Gospels in Latin, which were taken down by some hearers and published as sermons (Pastillo). He was therefore a lay theologian; but as such he wielded a powerful influence in that great ecclesiastical movement which makes the 16th century one of the most important periods in church history. He accepted a prominent part in the German reformation, and is inferior only to Luther and Calvin among
the reformers. His modesty, gentleness, and peacefulness stand in strange contrast with the furious contest into which he was reluctantly drawn. But, while Luther had to brace up his courage and to arm himself for the conflict, Melanchthon was admirably adapted to moderate the fiery zeal of his colleague, and to aid him with his superior learning. In 1519 he attended the Leipsic disputation, and defended Luther with his pen against Dr. Eck, the champion of the church of Rome. In 1521 he published the *Loci Communes*, the first system of evangelical Protestant theology, which passed through more than 50 editions during his lifetime, and was used long after his death as a text book in the Lutheran universities. At first it was but a fresh effusion of the vigorous evangelical faith in the Scriptures and the all-sufficient grace of God in Christ; but subsequently it was greatly enlarged and improved, although it never attained the philosophical depth, logical order, and precision of Calvin's "Institutes." In 1522 and the following years he wrote several commentaries which attracted much attention, but were overshadowed afterward by some of Luther's and especially by Calvin's commentaries. He also lent valuable aid to Luther in the translation of the Bible, which was commenced in 1522 and completed in 1534. In 1529 he accompanied his prince to the diet of Spire, and helped to draw up the famous protest of the evangelical minority against the Catholic majority of the diet, which gave rise to the name Protestants. In the same year he attended the unsuccessful theological conference with the Zwinglians at Marburg. At that time he agreed with Luther's view on the Lord's supper. In 1530 he spent several months at Augsburg during the session of the diet, and wrote his most important official work, the "Augsburg Confession," which was signed by the Lutheran princes, publicly read before the diet, and became by general consent the principal symboical book of the Lutheran church. Soon afterward he replied to the "Refutation" of the Catholic divines by the "Apology of the Confession," a work of great theological merit, and likewise of symbolical authority in the Lutheran church, though it is far less used and quoted than the Confession. Subsequently he made considerable modifications and alterations in the Confession, with the view to improve and to adapt it to the Reformed churches. Hence the difference between the "Altered," the "Augsburg Confession of 1540 and the "Unaltered" of 1530. The principal change refers to article X. on the Lord's supper, and the omission of all those words which favored the view of the corporeal presence and an oral fruition of the body and blood of Christ by all communicants. The changes were at first passed by or acquiesced in, but subsequently gave rise to violent controversies. In 1536 he endeavored, with Bucer, to bring about a doctrinal compromise between the Lutheran and Zwinglian views on the Lord's supper. In 1537 he signed the "Articles of Smalcald," drawn up by Luther, but added the singular proviso that he would acknowledge the supreme authority of the pope *jure humano*, if he would tolerate the freedom of the gospel; i.e., he was willing to become a semi-Catholic, if the pope would become a semi-Protestant. In all the conferences with the Roman Catholics, at Worms (1540), and at Ratisbon (1541), he was the delegate of the Lutheran party. In these conferences, and especially in the adiaphoristic controversy concerning the Augsburg and the Leipsic Interim (1548), he incurred the censure of the more determined Protestants. His motives were always disinterested; yet his timidity, modesty, love of peace, and the hope of an ultimate reconciliation of Catholicism and Protestantism, which he probably cherished to the end of his life, led him to make many concessions, and to agree to compromises which satisfied neither party and were soon broken up. This compromising disposition, and his doctrinal changes on the Lord's supper and other articles, together with various personal causes, disturbed his relations with Luther; yet their friendship was never entirely dissolved. Luther, though often dissatisfied with Melanchthon's timidity and vacillation, never openly took ground against him; and Melanchthon, in his funeral oration on Luther, called him the Protestant Elijah, and lamented his death as a great calamity for the church of Christ. From Luther's decease in 1546 to his own death in 1560 Melanchthon was the acknowledged leader of the German reformation, and was consulted by princes and universities on all important events and measures. In the mean time the Lutheran divines became more and more divided between two schools, the strict old Lutherans, headed by Flacius, Amstorp, Hessus, and other violent polemics against Roman Catholics as well as Calvinists, and the more moderate, conciliatory, and progressive Melanchthonians, who were generally called, after the Christian name of their leader. Melanchthon bore the violent abuse of his former friends and pupils with patience and meekness. What he lost in the opinion of the zealots for exclusive Lutheranism he gained in esteem and confidence with the Reformed churches in and out of Germany. He stood in friendly correspondence with Calvin to the last, and was invited to England. In 1551 he set out for the council of Trent as delegate from Saxony, when Maurice suddenly changed the aspect of affairs by his famous military movement against the emperor, and dispersed the council. The peace of Augsburg in 1555 materially improved the political condition of the Lutherans, and secured to them liberty of worship within the empire. In 1557 he attended, at the request of the emperor, the last theological conference with the Roman Catholics at Worms. He was received with great honor, but the
MELANCHTHON

conference ended in a complete failure, and the hope of reconciliation utterly vanished. This, in connection with the violent eucharistic or crypto-Calvinistic and other doctrinal controversies in the Protestant party, the unsparing attacks of the strict Lutheran party, and various domestic afflictions, greatly embittered the last years of his life, and broke down his weak physical frame, already exhausted by incessant study and application. Nevertheless he continued to write responsa et nota to the last. A few days before his decease he wrote in Latin the reasons which made death welcome to him, viz.: on the left side, deliverance from sin and from the acrimony and fury of theologians; on the right side, the light of eternity, the vision of God and his Son, and the full knowledge of those wonderful mysteries of faith which we can but imperfectly understand in this life. On a journey to Leipsic in March, 1560, he contracted a cold which proved fatal. His last and greatest care and sorrow was the distracted condition of the church; his last and most fervent prayer was for the unity of believers. When Peucer, his son-in-law, asked him whether he desired anything, he replied: “Nothing but heaven,” and soon afterward he breathed his last. He was buried in the principal church of Wittenberg, by the side of Luther.—As a reformer, Melanchthon was admirably adapted to assist Luther, and to supplement him. He was better suited for the quiet study than the commotion of public life. Inferior to Luther in strength of intellect and will, he surpassed him in scholarship and moderation of spirit. The one was the hero, the other the theologian of the German reformation. He reduced the new ideas to order and system, and confided them to literary men, while Luther powerfully impressed them upon the people. Melanchthon was of small stature and delicate frame, but had fine blue eyes and a noble forehead. He married in 1520 the daughter of the burgomaster of Wittenberg, and lived happily with her till her death in 1537. He called his nursery the “little church” (eclesiola Dei), and was occasionally seen rocking the cradle with one hand and holding a book in the other. He cared little or nothing for money, was extremely adorn- ing and benevolent, and unhumbled in all his moral relations. The otherwise beautiful symmetry of his character is marred by but one serious error (and this he shared with Luther), the qualified countenance reluctantly given to the double marriage of Philip, landgrave of Hesse.—The works of Melanchthon embrace a Greek and Latin grammar, editions of and commentaries on several classics and the Septuagint, Biblical commentaries, doctrinal and ethical works, official documents, declamations, dissertations, responses, and a very extensive correspondence. The first edition of his collected works appeared at Basel, in 5 vols. fol., in 1541; the second, under the editorial care of Peucer, at Wittenberg, in 1562-4; but both are incomplete. The most valuable edition is that of Bretschneider and Bindseil in the Corpus Reformatorum (28 vols. fol., 1834-60). The life of Melanchthon has been written by Camerarius (1566), Niemeyer, Köthe, Lederhoze (Heidelberg, 1847; translated into English by Krotel), Galle (1840), Matthaei (1841), Wohlfahrt (1858), Planck (Melanchthon, Praeceptor Germaniae, 1860; new ed., 1866), and Schmidt (1861).—On April 19, 1860, the tricentennial anniversary of Melanchthon’s death was celebrated with great enthusiasm throughout Protestant Germany. At Wittenberg, where “he lived, taught, and died” (as the inscription on his house reads), the corner stone was laid of a monument to his memory, to be erected beside that of Luther. The festal oration was delivered by Dr. Nitzsch of Berlin, the last surviving professor of the once famous university of Wittenberg. At the same hour the foundation of a similar monument was laid at Bretten, his birthplace.

MELANESIA. See Micronesia.

MELANOSIS. See Micronesia.

MELANOSIS (Gr. μελανός, to blacken), a morbid growth on the human body, characterized by the deposit of a black pigment. For a long time this was looked upon as a distinct disease, and melanotic tumors formed a class by themselves; but it is now believed that melanosis may occur in any of the textures, natural or morbid. It is found in the lungs, in the bronchial and mesenteric glands, and in the sympathetic ganglia, mixed with new deposit as cancer and tubercle. The coloring matter is generally thought to be derived from the hematin of the blood. The black deposit in the air cells of miners is a mere accumulation of carbonaceous dust.

MELAZZO. See Milazzo.

MELBOURNE. a city of S. E. Australia, capital of the colony of Victoria, on the banks of the Yarra-Yarra river, about 9 m. from its mouth, at the upper end of the large estuary of Port Phillip, 450 m. S. W. of Sydney; lat. 37° 48' S., lon. 144° 58' E.; pop. in 1841, about 4,000; in 1846, 10,000; in 1851, 23,000; in 1854, 76,000; in 1857, 106,000; in 1869, 170,000; in 1871, 191,254. The principal part of the town is on the N. side of the river, but some wards lie on the south, where South Melbourne, Sandridge, St. Kilda, and the W. part of South Yarra are comprised within the city boundary. North and South Melbourne are connected by a bridge. On the N. side the chief part of the town lies in a valley with its extremities carried over two hills. The S. side is flat and swampy, excepting the sandy margin of Hobson’s bay, where Sandridge stands. The streets of Melbourne are mostly laid out at right angles, wide, straight, and running the whole length or breadth of the town. They are macadamized in the middle, well drained, mostly flagged at the sides, and lighted with gas. In the original plan of the city lanes alternating with the main streets

545 vol. xi-24
were left, to afford back entrances to the houses; but as the value of property increased these lanes were occupied by merchants and tradesmen, became independent streets, and now form a very unsightly feature in the older part of Melbourne. The town is generally well built of brick and stone. Melbourne became the seat of a Roman Catholic bishop in 1847, and of an Anglican bishop in 1848; in April, 1874, the Catholic diocese was erected into an archbishopric. The most numerous churches are those of the church of England, Wesleyans, and Roman Catholics, and there are also places of worship for Independents, Lutherans, Baptists, and other Protestant denominations, as well as for Jews. The Wesleyan church opened in August, 1858, is said to be one of the handsomest church edifices belonging to that denomination in the world. Among the prominent buildings are the two houses of parliament, the custom house, the treasury, the post office, the free library with a museum of art and a reading room, several theatres, and an elegant club house. The university of Melbourne was opened in April, 1855. It occupies a beautiful site N. of the city, and has 40 acres of land, which form part of extensive pleasure grounds. The buildings are arranged in a parallelogram. The institution has departments of law, civil engineering, and arts, and enjoys an annual government appropriation of £9,000. A public museum of natural history, manufactures, and mining is attached to it, and also a gallery of fine arts, a botanic garden, and a bureau of statistics, with a fine observatory. The city has a well appointed public library, and there are numerous scientific and literary institutions. The Yan Yean water works, opened Dec. 31, 1857, supply the city from an artificial lake formed in the valley of the Plenty river, 18 m. distant. There are several pleasure grounds in the immediate neighborhood of the city, the chief of which are the royal park and the Carlton and Fitzroy gardens. Collingwood, Brighton, Richmond, St. Kilda, and other suburbs of Melbourne are studded with beautiful villas and terraces. Melbourne has regular steam mail service with England via the isthmus of Suez, and there are steamers to all the neighboring ports. Four railways radiate from the city, besides a short one connecting it with the harbor, and there are good roads to all the principal gold fields. The climate is on the whole cooler than is generally experienced in the same latitude N. The mean temperature of January (midsummer) is 66°, the highest 101°, and the lowest 45°, while the average daily variation of the month is 19°. There is a great proportion of dry sunny weather. The annual fall of rain, taken from the mean of five years, gives 32-68 inches. The wettest months are from April to November inclusive.

—In commerce Melbourne ranks as the first port in the British colonies, an importance due to the gold discoveries in 1851. Besides gold, the chief exports are wool, tallow, hides, and other kinds of raw produce. The imports in 1872 amounted to $6,298,819 and the exports to $67,064,170, the latter including $25,000,000 gold and $21,000,000 wool. The principal trade is with England, and that with the United States is not inconsiderable. The customs duties in 1872 amounted to $6,913,188. The Melbourne manufactories of mining machinery and other articles are steadily increasing. Ships drawing 24 ft. of water can come up Port Phillip as far as Hobson's bay at the mouth of the Yarra-Yarra; but vessels requiring more than 9 ft. cannot get over the bars. Although the distance to the bay by the course of the river is 9 m., it is not quite 2 m. by land, and a railway with an extensive jetty at its lower terminus has been made, connecting Melbourne with Port Phillip at Sandridge. There is another railway to Williamstown, on the opposite side of Hobson's bay, which, though considerably longer, has the advantage of better shelter for ships lying at the jetty. A ship railway has been constructed here capable of taking up very large vessels. From the anchorage in Hobson's bay to the Heads of Port Phillip the distance is about 35 m., and the channels are obstructed part of the way by sand banks which render the assistance of experienced pilots necessary. The Heads, or the opening connecting Port Phillip with Bass Strait, is about
2 m. across, but this is occupied by foul ground on either side, which leaves a channel little more than a mile broad. Through this narrow passage the ebb and flood tides sweep over the uneven bottom with great force, and raise a sea which, when there is a strong wind from the opposite direction, is often fatal to small craft. Strong fortifications occupy the points of land at either side of the entrance. The rise and fall of the tide is about 3 ft. Melbourne has steam flour mills, tallow-boiling establishments, brass and iron foundries, breweries, distilleries, and manufactories of clothing and woollen blankets. —The site of Melbourne was selected and occupied by a small colonizing party from Tasmania in 1835. Two years afterward the town was officially recognized and named in honor of Lord Melbourne, the British prime minister, by the government of New South Wales, to which Melbourne, together with the surrounding country, then called the Port Phillip district, belonged until the formation of a separate colony in 1851 under the name of Victoria.

MELBOURNE. I. William Lamb, viscount, a British statesman, born in London in 1779, died there, Nov. 24, 1848. He was the eldest son of the first Viscount Melbourne, and after an education at Trinity college, Cambridge, and the university of Glasgow, was in 1804 called to the bar at Lincoln’s Inn. In 1806 he entered parliament as a supporter of Fox and the whigs, but later he served under Canning as secretary for Ireland. In 1828 he succeeded to his title, and two years later he entered the cabinet of Earl Grey as home secretary. Upon the retirement of the latter in 1834 he became first lord of the treasury and prime minister, in which office he remained, with the exception of a brief period in 1834–5, when Sir Robert Peel temporarily assumed the premiership, till 1841, when he was again succeeded by Peel. His administration was distinguished by no important political event, but was rendered popular by the tact and personal qualities of the premier. II. Caroline (Ponsonby), known as Lady Caroline Lamb, wife of the preceding, born Nov. 13, 1788, died in London, Jan. 26, 1828. She was the only daughter of the third earl of Bessborough, and at 20 years of age was married to the future premier. Having tastes congenial with those of her husband, she shared with him the classical studies in which they were both proficient, and also made herself mistress of several of the modern languages. In 1816 she published “Glenarvon,” a novel of which the hero was supposed to shadow forth the character and sentiments of Lord Byron, for whom about 1815 she had conceived a romantic attachment. Byron severed his relations with her in the well known lines to her written a short time before his departure from England; notwithstanding which she still cherished a regard for him, and it is related that, coming suddenly upon the hearse which was conveying the remains of Byron to the grave, she fainted and was for some time prostrated by a severe illness. For many years she lived in seclusion in Brocket hall, and three years before her death was separated from her husband. She published two other novels, “Graham Hamilton” and “Ada Reis.”

MELCHIZEDEK, or Melchisedec (“king of righteousness”), according to Gen. xiv. 18, a “priest of the most high God” and “king of Salem,” who went forth to meet Abraham on his return from the pursuit of King Chedorlaomer, brought bread and wine for the warriors, and blessed Abraham, who in return gave him a tenth of the spoils. One of the Psalms (ex. 4) contains the words, “a priest for ever after the order of Melchizedek;” and the Epistle to the Hebrews (vi. 20, vii. 1–21) represents him as a type of Christ, and his office as superior to the Aaronic priesthood. The opinions of theologians as to the person of Melchizedek and the nature of his priesthood have at all times greatly varied. With regard to his residence, they are now generally agreed that Salem was a poetical name for Jerusalem. In the ancient church, a sect, called Melchizedelkites, regarded Melchizedek as an incarnation of a divine power, and as superior to Christ.

MELCHTHAL, Arnold von, a Swiss patriot, born in Unterwalden in the latter part of the 18th century. His real name was Arnold von der Halden, but he assumed the name of his native village. The Austrian bailiff Landenberg having ordered the seizure of a yoke of oxen belonging to Arnold’s father, the young man knocked down the menial and fled. His father refused to disclose his place of refuge, and was blinded by order of the bailiff. This cruel deed, which has been dramatized in Schiller’s “William Tell,” became the signal of revolution. Young Melchthal, in his retreat on the Grütli, was joined by Furst and Stauffacher, with whom and 30 other patriots, one night in November, 1307, he took an oath to devote his life to Swiss independence. This was achieved in January, 1308, by the expulsion of the Austrians from the cantons of Unterwalden, Uri, and Schwytz, and the destruction of their castles without bloodshed. The authenticity of the whole story, however, which is given in the Chronicon Helveticum of Aegidius Tschudi (died in 1572), has been questioned in more recent times, as well as the story of William Tell.

MELCOMBE, Lord. See Dodington.

MELEAGER. I. A mythical hero of Greece. The legends respecting him are discordant. According to one, he was the son of Mars and Althea, and to others, of Cacus and Altha. The prevailing legend is, that while Meleager was at Callydon, in Eetolia, the king once neglected to offer up a sacrifice to Diana, whereupon the angry goddess sent a monstrous boar to ravage the fields. Finally Meleager, with several companions, went out to
hunt the boar, which was killed by him. This expedition is known as the Calydonian hunt. It was a favorite subject with ancient artists. Meleager is usually represented as a robust hunter, with curly hair, wearing the ₣tolian chiton, and carrying a boar's head. II. A Macedonian general who served under Alexander the Great. At the battle of the Granicus, 334 B.C., he commanded one of the divisions of the phalanx; and in almost all the Asiatic campaigns he appears to have held the same office. On the death of Alexander (323) he was co-regent with Perdiccas, and was put to death by order of his colleague. III. A Greek epigrammatist, who flourished about the middle of the 1st century B.C. He was a native of Gadara in eastern Palestine, and made a collection of epigrams, entitled Στίχαι τοῦ ἔπηκόματος, from more than 40 authors. This work has perished, but 131 of his own epigrams are still extant, and have been collected and published by Manso (Jena, 1798), and most completely by Gräfe (Leipsic, 1811).

MELEGGANO, Marignano, or Marignan, a town of Italy, on the Lambro, in the province and 10 m. S. E. of the city of Milan; pop. about 4,000. It was destroyed by the emperor Frederick II. in 1259; and the Genoese and Ghil- belines signed a treaty of peace here in 1279. In September, 1515, it was the scene of a famous victory won by Francis I. of France over the Swiss in the service of the duke of Milan, which was called, from its obstinacy and the superior character of the troops on both sides, the "battle of the giants." Another French victory was gained here, June 8, 1859, four days after the battle of Magenta.

MELENDEZ VALDEZ, Juan Antonio, a Spanish poet, born at Ribera del Fresno, March 11, 1746; died in Rentmiller, France, May 24, 1817. He was educated at Salamanca, where he became professor of belles-lettres. In 1789 he obtained a prize offered by the Spanish academy for the best ocelogue. He was afterward employed in judicial and civil service, in Saragossa, Valladolid, and Madrid, but was banished in 1792, after the downfall of Jove- lianos. After some years he was permitted to return to Salamanca, and in 1808 attached himself to the French party, sharing in its misfortunes. Once he was led out to be shot by the populace of Oviedo, whither he had been sent as a commissioner. Finally he fled to the south of France, where he lived for four years in misery, and his death was hastened by destitution. His poems embrace odes, eclogues, idylls, and pastoral dramas, of which the most popular is "Camacho's Wedding." His collected works, with a life by Quintana, were published at Madrid in 1829.

MELETIUS, or Melitius, author of the Mele- tius schism, born in Egypt about 300, died at Lycopele, in the Thebais, in 380. He was made bishop of Lycopele about 300, and during the persecution became the head of the extreme party who refused to admit the lapsi to fellowship. Peter, bishop of Alexandria, who entertained more moderate opinions, having concealed himself in 305, Meletius, who had been condemned to death by the persecutors, escaped from prison, and, being second metropolitan of Egypt, undertook to set aside the authority of the absent Peter and of his vicars. He persisted in exercising full episcopal jurisdiction in Alexandria in spite of the remonstrances of the other bishops, and for this was excommunicated and deposed in a synod held there about 306. He resisted the action of the synod, and, calling his own party the pure church of the martyrs, created a schism in Egypt, which continued even after the martyrdom of Bishop Peter in 311. The council of Nice in 325 condemned the conduct of Meletius, and, while allowing him to retain the episcopal rank because he had suffered for the faith, forbade him to exercise any jurisdiction. But at that time 29 bishops had embraced his views, and four priests with three deacons in the city of Alexandria held out for him. After apparently submitting to the Nicene decision, he resumed his episcopal functions, consecrated a schismatic bishop, and a few days before his death appointed one of his own followers to be his successor. The Meletian party, without professing Arian doctrines, sided with the Arians against Athanasius. This schism disappeared early in the 5th century.

MELETIUS, Saint, bishop of Antioch, born at Melitene, near the Euphrates, about 310, died in Constantinople in 381. In 357 he was elected to succeed Eustathius, the deposed bishop of Sebaste, but soon resigned in consequence of the bitter opposition of the partisans of Eustathius. He then led a monastic life at Berea till about 361, when he was chosen bishop of Antioch in place of the deposed bishop Eudoxius, transferred to the see of Constantinople. The election took place in a large synod of Arian and orthodox bishops, who hoped by this choice to end the schism begun in 330 by the banishment of St. Eustathius. His inaugural discourse gave great offense to the Arian party supported by the emperor Constantius; they petitioned for his removal, and after holding the see of Antioch only 30 days, he was ban- ished to Armenia. Thus two orthodox parties came to exist side by side in Antioch, the Eustathians, who since 330 had held no fellowship with the Arians and Semi-Arians, and the great mass of the people, who now remained attached to the exiled Meletius. The bishop Euzoios, chosen by the Arians in place of Meletius, was at the head of the heterodox party. The Meletians asked the Eustathians to unite with them against the heretics, but were re- pulsed as infected with Arianism. Meletius was permitted to return to his flock in 382; but Lucifer of Cagliari, commissioned to exam- ine into this charge and hear the schism be- tween the Arians and Meletians, openly took part with the former, and consecrated their leader Paulinus as their bishop. Mean-
while Julian, intending to make Antioch the central seat of restored paganism, was opposed by Meletius, whom he banished again. He was recalled in 363, and held a council in which Acacius of Ccesarea and his adherents adopted the Nicene creed. In 364 Meletius was exiled a third time by the Arians, and was only recalled in 378. The Eustathians during the interval had been losing ground, the orthodoxy of Meletius became better known at Rome and Alexandria, and he himself found supporters and advocates in Basil the Great, Gregory of Nyssa, and Gregory Nazianzen. In 379 he convened in Antioch a council of 144 bishops, who condemned the Apollinarian heresy; and in 381 he presided at the first general council of Constantinople. He died soon after, and his remains were taken to Antioch and buried in the church of St. Babylas. John Chrysostom pronounced over his tomb an eloquent panegyric, Feb. 12, 386, on which day Meletius was honored as a saint by the eastern churches; his name was inserted by Baronius in the Roman martyrology for the same date.

MELI, Giovanni, an Italian poet, born in Palermo in 1740, died there, Dec. 30, 1815. He was professor of chemistry at Palermo. His compositions have procured him the titles of "the Sicilian Anaeaner" and "the modern Theocritus." A small pension was granted him, and a mausoleum was erected in his honor. He employed the Sicilian dialect, and his love songs especially are extremely popular in Sicily. A complete edition of his poetical works appeared at Palermo in 1814, in 7 vols., and an additional volume was published by Agostino Lallo in 1826. A new edition of his works, in 8 vols., appeared in 1830–39.

MELITA. See MALTA.

MELLEN, Grenville, an American poet, born in Biddeford, Me., June 19, 1799, died in New York, Sept. 5, 1841. He graduated at Harvard college in 1818, studied law in Portland, and removed in 1823 to North Yarmouth, where he engaged in practice. In 1826 he pronounced in Portland before the peace society of Maine a poem on "The Rest of Empires." In 1827 he published a satire entitled "Our Chronicle of Twenty-Six;" in 1828 delivered a poem before a society of Bowdoin college on the "Light of Letters;" and in 1829 issued a volume of prose entitled "Glad Tales and Sad Tales." "The Martyr's Triumph, Buried Valley, and other Poems" was published at Boston in 1833. He resided about five years in Boston, and in New York in 1839 he began a "Monthly Miscellany," which was discontinued after a few numbers. His health was always feeble, and he died of consumption after a voyage to Cuba in 1840.

MELLIN, Gustaf Henrik, a Swedish author, born at Revolax, Finland, April 23, 1808. He studied theology at Upsal, and acquired celebrity by numerous historical novels, most of which have been translated into German. He is also the author of many historical and biographical works, including Földlandets Historia, which has had several editions, and a history of Swedish literature (1864).

MELONI, Macchio, an Italian physicist, born in Parma in 1801, died in Portici, near Naples, Aug. 11, 1853. He was professor of natural philosophy in the university of Parma from 1824 to 1851, when political events compelled him to take refuge in France. Through the efforts of Arago he was appointed a professor in the college of Dôle, in the department of the Jura. Going thence to Geneva, he availed himself of the scientific instruments of Prévost and De la Rive to make several important discoveries respecting the radiation of heat, which he presented in 1833 to the French academy of sciences. His communication was received coldly, but the discoveries which it embraced subsequently procured him the Rumford medal from the royal society of London. He was enabled through the influence of Arago and Humboldt to return to Italy, and in 1839 was appointed director of the meteorological observatory then building on Mt. Vesuvius. There he made the discovery of heat in lunar light, which led to the determination of the analogy of radiant heat to light. For his presumed sympathy with liberal principles he was ejected from his post in 1849, and retired to a villa near Portici. In 1850 he published the first volume of La termocroasi, o la colorazione calorifica, containing an account of his theory of the "coloration of light," and of his experiments on the diffusion of heat by radiation, and particularly of its transmission through transparent media. A month before his death he communicated to A. de la Rive the result of his researches in electrical induction.

MELMOTH, J. William, an English author, born in London in 1666, died there, April 6, 1743. He was called to the bar in 1693, and appears to have been treasurer of Lincoln's Inn in 1730. He is known as the author of "The Great Importance of a Religious Life Considered," of which 100,000 copies were sold. A new edition was privately printed in London in 1849, and presented to the benchers of Lincoln's Inn. H. William, son of the preceding, born in London in 1710, died in Bath, March 15, 1799. He was educated for the bar, but lived chiefly in retirement, and published "Letters on Several Subjects" (2 vols., 1742).

MELO, or Mello, Francisco Manuel de, a Portuguese historian and poet (who wrote in Spanish), born in Lisbon, Nov. 28, 1611, died there, Oct. 13, 1665. He early became familiar with literature, but entered the army and attained the rank of colonel. When the insurrection against Philip IV. broke out in Catalonia he was sent thither, and at the request of the king he wrote Historia de los movimientos, separacion y guerra de Cataluña (Lisbon, 1645; 2 vols., Paris, 1829), which ranks as a classic. After the separation of Portugal from Spain, he entered the service of his native country, but was imprisoned under a false accusation of
murder, and was for years an exile in Brazil. Many of his works are unpublished, but more than 100 volumes have been printed. His most popular poems are embraced in *Las tres musas del Melodino* (Lisbon, 1649).

**MELODEON** (Gr. μελόδια, melody), the name, at different times, of two or more unlike forms of musical instruments, but now appropriated to one of recent date, and so far excelling those before it as to be substantially a new invention. In this, externally resembling the piano, the tones are produced by touching the keys of a finger-board; each key, lifting a valve, allows a current of air from a bellows, worked meanwhile by the foot on a pedal, to agitate the corresponding one of a series of metallic free reeds; the compass is five to seven octaves. The rocking melodeon, known in America since about 1825, was unsightly, tardy in sounding, and of harsh tone. Jeremiah Carhart improved the plan of acting on the reeds by suction instead of blowing, and introduced other improvements, inventing the present instrument in 1836. The art of voicing the reeds, the most important improvement in such instruments, was invented by Emmons Hamlin in 1848. (See Reed Instruments.) In 1859, 22,000 melodeons were manufactured in the United States. But few are now made, this instrument having been almost entirely superseded by the cabinet or parlor organ, nearly 30,000 of which were manufactured in the United States in 1872.

**MELODRAMA.** See *Drama, vol. vi., p. 247.*

**MELODY.** See *Music.*

**MELOX,** the common name for fruits of vines of the *cucurbitaean* or gourd family. In England, where but one kind is cultivated, the name melon applies solely to the fruit of *cucumis melo*; but in this country we have also the fruit of a very distinct plant, *citruslus vulgaris,* and the distinction is made of muskmelon for the one and watermelon for the other. The same uncertainty surrounds the origin of the muskmelon that attaches to many of our cultivated plants; it is quite doubtful whether it has ever been found in a truly wild state, but it is supposed to have originated in India, and to have been brought thence by way of Persia. As with other cultivated plants of the family, the tendency to vary is great, and the forms or varieties in cultivation are numerous. The plant is a running vine, extending from 4 to 8 ft. or more, bearing large, generally heart-shaped and angled leaves, rough on both sides; the tendrils are simple; the flowers monoeious, the sterile in small clusters and the pistillate ones solitary in the axils of the leaves; the fruit, which is variable in size, has a thick and fleshy pericarp, usually ribbed exteriorly; when ripe, the watery and stringy placenta partly fill the cavity, and are rejected with the seeds when the fruit is eaten. The melon reaches its greatest perfection in warm climates, but so readily does it adapt itself to cultivation that several varieties come to maturity in the short summers of New England. In England melons cannot be raised with any certainty except under glass, but in this country they are almost entirely cultivated in the open air. The soil can hardly be made too rich, and it is the custom to sow the seeds in hills which have been especially prepared with an abundance of well decomposed manure. As the young plants are attacked by various insects, a great abundance of seed is sown, and when they are large enough to run, all the plants but two or three are removed from the hills, which are made 6 or 8 ft. apart each way. In cold countries or other care is given than to protect the young plants from insects by dusting with lime or ashes, but in gardens the vines are sometimes pinched at the ends to induce branching, and the fruit is turned to insure its ripening evenly; when thoroughly ripe the stem separates from its attachment to the fruit by a well defined line, and a practised eye can judge by this alone of the maturity of the fruit. Great numbers of melons are shipped from southern ports to northern cities; these are picked before they are fully matured and come into condition for eating by the time they reach the consumer. The varieties, if grown near one another, are very difficult to keep pure, and it is the custom with those who raise melons for market to have but one variety, and to take great care in the selection of plants for seed; and each grower generally has his own particular "strain." In size the varieties range from the pocket melon, no larger than an orange, to the large Persian kinds weighing 12 or 15 lbs.: in form they are globular, oblate, or oval. In no respect is the difference greater than in the quality of the flesh; the common muskmelon, still found in some country gardens, with its name corrupted not inappropriately into mush melody, with its dry, mealy, and nearly tasteless fruit, is so inferior to the rich, melting improved varieties, that one can hardly believe them to have had the same origin. Melons from seed brought from Armenia by missionaries were cultivated over three centuries ago at Canteluppi, a villa near Rome, and thence introduced to other parts of Europe as canteluppi; the name is still in use in some parts of Europe for a class of depressed-spherical, deeply ribbed, yellow-fleshed varieties, but in this country it is of very indefinite application, and has almost entirely passed out of use. The surface in some varieties is quite smooth,
but generally it is roughened with corky protuberances in the form of a network, and the abundance of this netting is in many sorts a mark of purity. It is very difficult to make a classification of the varieties other than by the color of their flesh, which in some is green and in others orange or scarlet. The green-fleshed varieties are the most highly esteemed, and among these the most generally cultivated is the green citron, which is somewhat flattened at the ends, 6 in. or more in diameter, deeply and regularly ribbed; skin green, turning yellowish, and thickly netted; the flesh green, thick, and juicy, and of a highly sugary and rich flavor. This in some of its forms is the great market melon, of which immense quantities are sent from the south early in the season, and later from the market gardens near cities; by selection it has been increased in size, and specimens a foot or more in diameter are sometimes seen. The nutmeg is a slightly oval variety, and when pure is highly perfumed and one of the best. Related varieties are the Christiana, valued chiefly for its earliness, Skillman’s fine netted, and Ward’s nectar, all of which are better suited for private gardens than for market. A comparatively recent introduction is the white Japan, a small fruit with a cream-white skin, smooth or slightly netted, and an unusually thick flesh in proportion to its size, and excellent in quality. The large netted muskmelon is very productive and sweet, but inferior to those already named. There are several varieties known as Persian melons, which have a remarkably thin rind and extremely tender thick flesh; these require a longer season than the ordinary kinds, and are not so well adapted to northern localities; one of the most successful of these is the Cassaba, which is a great favorite near Philadelphia and southward; the Ispahan is regarded as the finest of all, and the most difficult to cultivate. Some of the Persian melons can be preserved for a long time after they are removed from the vines by suspending them in a warm room; the dumpsha is of this class, and is much cultivated in the south of Europe. The varieties so much cultivated in England under glass are little known in this country. The melon is a most popular fruit, but does not agree with delicate stomachs; and it is the custom with many to eat it with the addition of salt and pepper to render it more digestible.—The watermelon (citrullus vulgaris) is of Asiatic, or as some say of African origin, and is believed to be the melon referred to in Numbers xi. 5. It is largely cultivated in all warm countries, and presents almost as many varieties as the muskmelon. The vine is a rampant runner, extending from 10 to 18 ft.; the leaves are deeply three- to five-lobed, with the divisions themselves lobed, and of a bluish green; the tendrils are two- or three-forked; both kinds of flowers are solitary in the axils of the leaves, and pale yellow; fruit with a smooth rind, roundish or oblong, of a uniform green or variegated with several shades of that color; in ripening the placenta in which the seeds are imbedded, as well as the pericarp proper, become fleshy and edible; the seeds are white, brown, or black. The cultivation of the watermelon is essentially the same as that of the
MELON

Muskmelon, except that the hills are made further apart; the young plants are less liable to the attacks of insects than those of the ordinary melon. The variety first seen in the northern markets is the Carolina or mountain sprout, of which large quantities are brought each season from the southern states; it is large, elongated, and often enlarged toward the blossom end; the skin is dark green, variegated with longitudinal mottled stripes of lighter color or white; the red flesh is of fair quality, and the seeds are black. One of the best varieties is the ice-cream, which when pure is nearly round, pale green, with white flesh and seeds; this is one of the earliest varieties and best suited to northern localities. The black Spanish is one of the sweetest of all, and has a flesh of the darkest red; it is somewhat oblong, slightly ribbed, with a skin of dark blackish green. Joe Johnston and Souter are popular southern varieties. The orange watermelon is remarkable for its keeping qualities, as well as for the readiness with which the flesh parts from the rind. The apple-seeded, so called from the size, shape, and color of its seeds, is another long-keeping kind. New varieties are added to the list each year, and old ones are dropped. The seeds of the watermelon have been used, together with those of the cucumber and other cucurbites, in the form of an emulsion, for diseases of the urinary organs. A few years ago a company was formed in California for the purpose of making sugar from watermelons, but apparently without practical results.

The citron watermelon is small, nearly spherical, handsomely marbled with different shades of green, with a white, solid, tough, and seedy flesh, which is quite unpalatable. This is exclusively used for making sweetmeats; the flesh is cut into convenient pieces, often into fancy shapes, and cooked in sirup, becoming semi-transparent; the preserve has a slight but peculiar and distinct flavor of its own; it is often prepared with fresh ginger in imitation of the imported preserved ginger.

MELROSE

MELOS (the ancient name, now restored), or Mileo, an island in the Grecian archipelago, one of the Cyclades, belonging to the kingdom of Greece, lying about 65 m. E. of the coast of the Peloponnesus, in lat. 38° 40' N., lon. 24° 29' E.; length 18 m., greatest breadth 8 m.; area, 65 sq. m.; pop. about 3,500. On the N. coast is a deep bay which forms one of the best harbors in the Levant, and on this was once the flourishing town of Melos. The island is of volcanic origin, and is rugged and mountainous, and in parts naked and sterile. Mt. Calamos is still a semi-active volcano, emitting smoke and sulphurous vapors; and hot springs and mines of sulphur and alum are found in various places. Mt. St. Elias, in the S. W. part, is 2,538 ft. above the sea. The valleys and low grounds are very fertile, and when cultivated produce corn, olives, wine, oil, cotton, and fruits in abundance; but the lowlands are malariaous and the water brackish, and the island is now almost depopulated. Extensive ruins mark the site of ancient Melos. It is overlooked by Castron, a village on a rocky height above the N. entrance of the bay, which is now the seat of the local government.—Melos was first colonized by the Phoenicians, and afterward by the Lacedaemonians. It was rich and populous, but was ruined by the Peloponnesian war, during which the capital was captured by the Athenians, its adult males were put to death, and its women and children carried off as slaves, 416 B. C. The principal relics of antiquity are tombs and subterranean vaults, some of which contain 15 or more sarcophagi. The celebrated statue of the Venus of Milo was found in 1820 in the vicinity of Melos, together with three statues of Hermes.—Anti-Melos, a small mountainous island 6 m. N. W. of Melos, is uninhabited save by wild goats. With this and some other islands, Melos forms an archipelago of the Cyclades.

MELPOMENE, in Greek mythology, the muse who presided over tragedies. She was a daughter of Zeus and Mnemosyne, and is generally represented as a young woman of grave countenance, arrayed in splendid garments, wearing the csorthus, with a wreath of vine leaves on her head, a sword or the club of Hercules in one hand, and a crown or sceptre in the other.

MELROSE ABBEY, a celebrated ruin in the town of Melrose, Roxburghshire, Scotland, near the Tweed, 31 m. S. E. of Edinburgh. It was founded in 1138 by David I., completed in 1146, and dedicated to the Virgin Mary. The first occupants were Cistercian monks from Yorkshire, England. In 1392 it was destroyed by the English army of Edward II., but was soon rebuilt by Robert Bruce substantially after the present design, and in a style of magnificence which ranks it among the most perfect ecclesiastical structures of the best age of Gothic architecture. In 1385 and again in 1545 it suffered severely at the hands of English armies; and during the reformation its choicest sculptures were mutilated.
In later times it has been despoiled of many of its stones to furnish materials for other buildings; yet at the end of five centuries the church, which is the only part of the ancient monastery remaining, is one of the best preserved specimens of Gothic architecture.

**MELTON-MOWBRAY**

A town of Leicestershire, England, on the Midland railway, 15 m. N. E. of Leicester; pop. in 1871, 5,033. It has much improved of late years, and the parish church was thoroughly restored in 1867. There are a Roman Catholic and various Protestant chapels, a mechanics' institute, two large free schools, and several charitable institutions. Stilton cheese and pork pies are largely produced; and there are manufactures of bobbinet lace, breweries, and tanneries. The Melton hunt attracts hither many sporting men.

**MELEN** (anc. Melodumnum), a town of France, capital of the department of Seine-et-Marne, on the Seine, 25 m. S. E. of Paris; pop. in 1866, 11,408. Part of the town is built on an island in the Seine. The most important portion, on the right bank, rises in the form of an amphitheatre, and contains a large square and several fine promenades. The church of Notre Dame has two Romanesque towers, and that of St. Aspais is a lofty edifice of the 15th century, with double aisles, an elaborate vault, and some fine painted glass windows. The central prison is adapted for 1,200 persons; the prefecture occupies an ancient Benedictine abbey; and there are a communal college, a primary normal school, and a public library. Cloth, woollen, and cotton goods, earthenware, and other articles are manufactured. In the neighborhood, which is remarkable for its fine scenery, is Fouquet's château of Vaux-Praslin, where the brilliant financier was arrested in the midst of a fête which he gave in honor of Louis XIV.—The town was besieged by the Normans, and on several occasions by the English, who were finally expelled. At the beginning of the 12th century Abélard, though very young, opened a school of philosophy in this town, which was at that time a favorite resort of the French court.

**MELVILLE, Andrew, a Scottish religious reformer, born at Baldo-

vy, Forfarshire, Aug. 1, 1545, died in Sedan, France, in 1622. He was educated at the university of St. Andrews, and passed several years at Paris, Poitiers, and Geneva, alternately studying and teaching. In 1574 he returned to Scotland, and was appointed principal of Glasgow college. He took a prominent part in the theological contro-

**MELVILLE**

versies of his age, and in the establishment of Presbyterianism in Scotland. Toward the close of 1580 he was made principal of St. Mary's college in the university of St. Andrews, and lecturer on theology and the oriental languages. In 1582 Melville opened an extraordinary meeting of the Presbyterian general assembly with a sermon, in which he vigorously opposed the absolute authority assumed by the court in ecclesiastical affairs. He assisted in drawing up the remonstrance against the policy of the court, subsequently presented to the king at Perth by a deputation of which he was the head. The earl of Arran, one of the council, being irritated at the bold tone of this document, asked fiercely: "Who dares subscribe these treasonable articles?" "We dare," replied Melville and immediately seizing a pen, affixed his name to it. This was imitated by all his colleagues, and the council suffered them to depart uncensured. But within two years Melville was summoned before the privy council on a charge of treason for words uttered in the pulpit, and Arran excused himself for his conviction. The accusation could not be proved, and he was sentenced to imprisonment on the charge of irreverence toward the council; but he escaped to London, and returned to Scotland, on the fall of Arran, in November, 1585. In 1587, 1589, and 1594 he was chosen moderator of the general assembly; in 1590 he became rector of the university; and in 1595 he delivered at the coronation of the queen a Latin poem entitled Stephanikion, which, being printed at the solicitation of James VI., was read with admiration throughout Europe. He was accustomed to address the king with the utmost plainness
upon his foibles and vanity; and being a member of a commission appointed in 1596 to re-
monstrate with regard to certain measures in-
imical to religion, he chided James so severely as to excite him to great anger, but finally sub-
dued him and obtained every concession de-
manded. James after his accession to the
English throne continued his efforts to obtain
control of the Scottish church, in which he had
hitherto been thwarted in great part by Mel-
vile. In May, 1606, he and other leading Pres-
byterians were summoned to London under
pretense of being consulted by the king upon
Scotch ecclesiastical affairs. They obeyed, but
soon discovered that they were not free agents;
and Melville, for having indicted a Latin epigram expressive of his contempt for certain
ceremonies he had witnessed at the royal
chapel, was brought before the privy council,
found guilty of seculatum magnatum, and
committed to the tower, where he remained
till 1611, when, at the solicitation of the duke
de Bouillon, he was liberated on condition
that he should expatriate himself. Retiring
to Sedan, then belonging to the dukes of Bou-
illon, he was appointed professor of theology
at the university of that city. His earliest pro-
duction was a volume of Latin poems (Basel,
1574). There is a MS. commentary by him
on the Epistle of Paul to the Romans, still ex-
tant.—See the "Life of Andrew Melville," by
Dr. McCrie (2 vols., 1819).

MELVILLE, Herman, an American author, born in
New York, Aug. 1, 1819. At the age of 18
he shipped before the mast on a vessel bound
for Liverpool, and in 1841 he embarked for the
Pacific, as a sailor, on a whaling vessel, in
which he cruised for 18 months; but, unable
to endure the harsh conduct of the captain, he
deserted with a comrade at Nukahiva, one of
the Marquesas islands. Losing his way, he
wandered into the Typee valley, where the
warlike people who take their name from the
valley held him four months in an indulgent
captivity. At the end of that time he was
taken off by a boat from an Australian whaler, which
carried him to Tahiti. He passed
some time in the Society and Sandwich islands,
and in 1843 shipped on board the frigate Uni-
ited States at Honolulu, and arrived in Boston
in October, 1844. "Typee," a narrative of
his adventures in Nukahiva, appeared in 1846
in New York and London, and achieved an
immediate success. It was followed in 1847
by "Omoo, a Narrative of Adventures in the
South Seas," which recounts his escape from
Typee and subsequent voyage. "Mardi and a
Voyage Thither," a philosophical romance
which was less admired, and "Redburn,"
found on the incidents of his first voyage,
appeared in the same year. He married in
1847 a daughter of Chief Justice Shaw of Mas-
achusetts, and resided for a few years in New
York. He removed to Pittsfield, Mass., in
1850, and afterward returned to New York.
His remaining works are: "White Jacket, or
the World in a Man-of-War" (1850); "Moby
Dick, or the White Whale" (1851); "Pierre,
or the Ambiguities" (1852); "Israel Potter"
(1855); "The Piazza Tales" (1856); "The Con-
fidence Man" (1857); and "Battle Pieces and
Aspects of the War," a volume of poems (1866).

MELVILLE, Sir James, a Scottish soldier, born at
Raith, Fife, about 1535, died at Hal-
hill, in the same county, in November, 1609. At
the age of 14 he went to the continent, where
he was taken into the service of the constable
Montmory, and made several campaigns in
France and Flanders. In 1557 he took part in
the battle of St. Quentin, where he was wounded
and taken prisoner. In 1559 he went on a
secret mission to Scotland, and after the fall
of Montmory he went to Germany and en-
tered the service of the elector palatine, with
whose son he visited France in 1561. After
his return to Scotland he entered the ser-
vie of the queen, who sent him twice on a
mission to Elizabeth. After the murder of
Darnley he reproved her on her par-
tiality for Bothwell, whereupon he lost favor,
but nevertheless adhered to her until she was
imprisoned in Lochleven castle. On the ac-
cession of James he was made a gentleman of
the bedchamber and a member of the privy
council, and was even pressed by the king to
accompany him to London when he went to
take possession of the throne of England. He
declined this invitation, and devoted his latter
days to his "Memoirs of Sir James Melville of
Hal-hill, containing an Impartial Account of
the most remarkable Affairs of State during the
last Age." The earliest edition is London,
1688; the best, Edinburgh, 1827.

MELVILLE, Lord. See DUNDAS, HENRY and
ROBERT.

MELVILLE ISLAND. I. In polar America. See
MELVILLE SOUND. II. An island lying off
the N. W. coast of Australia, between lat. 11°
S. and 11° 56' S., and lon. 133° 20' and 131°
34' E.; area, about 1,800 sq. m. It is separated
from the mainland on the east by Dundas strait,
which is 15 m. wide, and on the south by Clark-
ence strait and Van Diemen's gulf; while on
the west it is severed from Bathurst island by
Apeley strait. The N. and W. coast is low,
and indented with shallow bays, but elsewhere
the coast is high and precipitous. In the cen-
tre the island rises from 130 to 200 ft. Vege-
tation is luxuriant. Several species of eucaly-
ptus are among the most abundant forest
trees. The cabbage tree is common, and gin-
ger grows wild. The fauna is identical with
that of Australia. Alligators and turtles abound
on the coast. The climate from October to
May, owing to the great heat and humidity of the
atmosphere, is unhealthy, but from May to October it is salubrious. The natives are
chiefly hunters, and are more athletic and en-
terprising than those of Australia.

MELVILLE SOUND, or Parry Sound, a body of
water in the north polar regions of America,
lying between lat. 72° and 75° N., and lon.
MEMBRANE

100° and 115° W., enclosed between the Parry islands (Melville, Byam Martin, Bathurst, &c.), on the N., Prince of Wales Land on the S. E., Prince Alexander Land on the S. W., and Baring island or Banks Land on the W.; length E. and W. about 300 m.; breadth N. and S. 200 m. Byam Martin channel opens into it on the N.; Banks strait connects it with the Arctic ocean on the N. W.; on the S. an opening discovered by Capt. Allen Young of McClintock's expedition in 1859, and since named McClintock channel, leads between Prince Albert and Victoria Lands and Prince of Wales Land into Victoria channel; and on the E. it communicates through Barrow strait and Lancaster sound with Baffin bay.—MELVILLE ISLAND, which lies N. W. of the sound, is irregular in form, and measures about 280 m. from E. to W. and 180 in greatest breadth. Its coast line is broken by several deep gulfs, and it has numerous peninsulas, the chief of which are Sabinie and Dundas. It is separated from Bathurst and Byam Martin islands by Byam Martin channel, and from Prince Patrick and Eglinton islands by Fitz William and Kellet straits. The geological formation of its N. part is carboniferous limestone, and of the rest lower carboniferous sandstone with beds of coal.—MELVILLE PENINSULA is a projection of the N. coast of the American continent, bounded N. by Fury and Hecla strait, which separates it from Cockburn island, E. by Fox channel, S. by Frozen strait and Rowe's Welcome, and W. by Committee bay, at the head of the gulf of Boothia. It is connected with the mainland by Rae isthmus at the S. W. It lies between lat. 66° 10' and 69° 50' N., and lon. 81° and 87° W., and measures about 280 m. from N. to S. and 150 m. from E. to W.

MEMBERTOU, Henry, a Micmac sagamore and medicine man, born about 1600, died in 1611. He is said to have seen Cartier in his youth; he received De Monts and his colonists, on their arrival in Acadia in 1604, with a friendship that never changed, and by his influence aided them greatly, being the most powerful chief on the coast. He was tall, strongly built, and bearded like a Frenchman. He at one time gathered 400 of his tribe in a palisaded village near the French post, and in 1607 led a large Micmac force against the Armonovichois Indians, near the Merrimack, whom he defeated. Lescarbot commemorated his victory in a French poem. He was hastily baptized, with his wife and three sons and 16 others, June 24, 1610, and seemed to endeavor to live a Christian life, though his excessive zeal led him to wish to make war on all tribes that refused to embrace Christianity. In the autumn of the following year he was brought in a dying condition to Port Royal, and, though carefully attended by the missionaries, soon expired, at the reputed age of 110.

MEMBRANE, a general term applied to thin layers of tissue, more or less elastic, whitish or reddish, lining either closed cavities or canals opening externally, absorbing or secreting fluids, and enveloping various organs. The simple membranes are either mucous, serous, or fibrous. The mucous membranes are so called from the peculiar fluid or mucus which they secrete; they line the passages of the body which communicate externally, and by which foreign substances are taken in or the secretions and excrementitious matter carried off; they are continuous with the skin, perform many of its offices internally, and at the points of contact, as in the lips, can hardly be separated by a distinct demarcation. Soft and smooth or velvety, reddish and very vascular, attached to muscle, cartilage, or even perios- teum, their free surface is lined with a layer of epithelial cells covering the vascular parts. They present papille upon the tongue, villosi- ties and folds in the alimentary-canal, and depres- sions for glands almost everywhere. The three divisions of the mucous membranes are those lining the digestive, respiratory, and genito-urinary passages. The digestive mu- cous membrane begins in the mouth, extends through the esophagus to the stomach, and through the intestinal canal to the anus, sending prolongations into the ducts of the salivary glands, liver, pancreas, and gall bladder. The respiratory mucous membrane lines the nose and the cavities and sinuses connected there- with, the eyelids, middle ear, larynx, trachea, and the bronchial ramifications. The genito-urinary mucous membrane extends externally from the uriniferous tubes of the kidney, and into and through the reproductive organs. In each of these tracts the membranes present some slight modifications adapted for special functions. Mucous membranes are generally endowed with keen sensibility at their points of origin from the skin, as on the lids, lips, &c., but gradually become less sensitive and finally almost insensible, in a healthy state, in the interior of the organs. Besides being the seat of various secretions and absorptions, they assist in the functions of digestion, respiration, and reproduction. (See EPITHELIUM, GLAND, and INTESTINE.)—Serous membranes are form- ed of fibre-cellular tissue covered with epithelial cells; they are very thin, smooth, trans- parent, and extensible, not having the folds, papille, and glands of mucous membrane; they are closed sacs, and are found wherever inter- nal organs come in contact with each other, or lie in cavities where more or less motion is re- quired; they consist of two layers, the first surrounding the organ itself, and the second reflected upon the parts with which it is in contact and on which it moves; the cavity is lubricated by a serous fluid, exuded from the surface of the membrane. They are of two kinds: those which line the visceral cavities, as the peritoneum in the abdomen, the pleura and pericardium in the chest, and the arachnoid of the brain and spinal cord; and the synovial membranes, which line the joints, sheaths of tendons and ligaments, and bursa interposed
between muscles and points of bone over which they glide. They are all shut saes, except where the Fallopian tubes in most vertebrates open into the abdominal cavity. Serous and synovial membranes by their polished and well lubricated surfaces secure the free movement of contiguous organs, as in the intestines, lungs, and joints; in health their fluid is only sufficient for this purpose, but in a state of inflammation the amount is largely increased, as in the dropical effusions of peritonitis, pleurisy, pericarditis, hydrocephalus, and synovitis; their sensibility in the normal state is nothing, but in diseased conditions may become acute, as in pleurisy and peritonitis.—Bichat gives the name of fibrous membranes to the aponeuroses of muscles, the capsules of the joints, the sheaths of the tendons, the periosteum, the dura mater of the brain, the sclerotic coat of the eye, &c.; these are never free, but are in contact with and adherent to the parts surrounding, and not moistened by secreted fluid; they are whitish, of a pearly and often shining lustre, and may form saes, sheaths, or extended layers of thin tissue; possessing elastic and inelastic fibrous tissue, they afford strength to organs, retain the muscles and tendons in place, give the shape to the limbs, favor the movements of the skin and superficial muscles, and assist the venous circulation.—Membranes, especially the serous, may be formed as the accidental products of disease, as in cysts in various parts of the body. False membranes are layers of coagulated fibrine or lymph exuded upon inflamed surfaces, presenting the external form of true membranes, but destitute of organization; under the influence of violent or special inflammations they may endanger life by closing passages, as in the false membrane thrown out in croup. (See LympH.) The membranes of the foetus are alluded to under Embryology, and several other membranes under the names of the organs to which they specially belong.

MEMBRÉ, Zesobius, a Franciscan missionary, born at Bapaume, France, in 1645, killed in Texas about 1687. He was the first novice in the Recollect province of St. Anthony, and was sent to Canada in 1675. Three years later he accompanied La Salle’s expedition to the west, remained at Fort Crèvecoeur with Tonty, and aided him in mediating between the Iroquois and Illinois. He subsequently descended the Mississippi with La Salle, and wrote a narrative which was published by his cousin, Father Christian Le Clercq, in his Établissement de la foi. He returned to France in 1682, and became warden of a convent at Bapaume. He accompanied La Salle on his expedition to the mouth of the Mississippi, and was left by him in the fort in Texas, where with the rest he was massacred by the Indians. Membré was esteemed for his mildness and virtues. His narrative was claimed by Hennenpin, and is by some even at the present time supposed to have been written by La Salle.

MEMEL, the northernmost town of Prussia, in the province of East Prussia, on the Baltic sea near the Russian frontier, at the N. end of the Kurisches Haff, and at the mouth of the river Danzig, 72 m. N. N. E. of Königsberg. pop. in 1871, 19,019. It is fortified and well built, has several churches, an excellent naval school, a gymnasmum, a high school for girls, and various charitable institutions. The harbor is commodious and safe, and its entrance from 15 to 15 ft. deep. A fort was built on the N. end of the Kurische Nehrung in 1866. A considerable part of the trade between Russia and Germany passes through the town. It is the centre of the Baltic timber trade. The other principal exports are grain, linned hemp, flax, hides, and tallow, most of which are received from Russia and Poland. The chief imports are salt, coal, colonial produce, herrings, and manufactured goods. The important manufactures are articles of amber, soap, and brandy. There are iron foundries, chain factories, and about 60 saw mills, and the ship building is considerable.—Memel was built in the middle of the 15th century by the Tentonic knights. In the 17th century it was for some time in the possession of the Swedes, and in 1757 it was taken by the Russians. In 1854 the town was nearly destroyed by fire.

MEMEL RIVER. See NİMEN.

MEMLING, or Memling, Hans, a Flemish painter, born probably near Bruges about 1425, supposed to have died in Spain in the beginning of the 16th century. He was a pupil of Roger of Bruges, and was one of the best artists of the school of Van Eyck. He visited Italy and Germany in middle life, and is said to have served Charles the Bold of Burgundy in the twofold capacity of painter and soldier. After the battles of Granson and Morat (1476), he gained admittance into the hospital of St. John in Bruges, penniless and disabled by wounds, and painted for the institution some of his finest works. Two of these, altarpieces with wings, are inscribed with his name and the date of the year, 1479. In the chapel of the hospital is also the celebrated reliquary of St. Ursula, a shrine about 4 ft. long, with the history of the saint on the longer sides in six compartments. These pictures are among the most interesting productions of the Flemish school.

MEMMI, Simone, or more properly Simone DI MARTINO, an Italian painter, born in Siena about 1285, died in Avignon about 1345. He is said to have been a pupil of Giotto, and was one of the first to modify the severity and harshness of the Byzantine manner by imitating the softer style of his master. After the death of the latter he was invited to the papal court at Avignon, where he is said to have painted the portrait of Laura de Sade, on account of which he is mentioned in two of Petrarch’s sonnets. At Avignon he also executed a miniature illumination for a manuscript Virgil, once owned by Petrarch and now preserved in the Ambrosian library at Milan.
MEMMINGEN, a walled town of Bavaria, in the district of Swabia and Neuburg, on the Aach, 41 m. S. W. of Augsburg; pop. in 1871, 7,215. It has six churches, a handsome town house, grammar and industrial schools, a hospital, an orphan asylum, manufactures of chin tint, calico, wax cloth, ribbons, tobacco, copper, and iron, a bell foundry, bleach fields, and glue works. It was a free imperial city till 1802. Here on Oct. 13, 1805, 4,000 Austrians surrendered to the French under Soult.

MEMMINGEN, Charles Gustavus, an American politician, born in Württemberg, Germany, Jan. 7, 1803. His mother, a widow, emigrated to Charleston, S. C., when he was an infant, and soon died. He was placed in an orphan asylum, but at the age of nine was adopted by Gov. Thomas Bennett. He graduated at the South Carolina college in 1820, began to practise law in Charleston in 1825, and was a leader of the Union party during the nullification excitement. He published "The Book of Nullification" (1832-3), satirizing the advocates of the doctrine in Biblical style. In 1836 he was elected to the legislature, where he opposed the suspension of specie payments by the banks in 1839. He assisted the attorney general in the prosecution of the principal case, which resulted in a decision that the banks had forfeited their charters. For nearly 20 years he was at the head of the finance committee in the lower house of the legislature, from which he retired in 1852. He was again returned in 1854, having become particularly interested in the reformation of the public school system. In 1859 he was a commissioner from South Carolina to Virginia, to secure cooperation against the movements of abolitionists. He was appointed secretary of the treasury of the Confederate States in February, 1861, and resigned in June, 1864.

MEMNON, a hero of the Trojan war, son of Tithonus and Eos or Aurora. Homer in the Odyssey describes him as the handsome son of Eos who brought a force of Ethiopians to assist in the defense of Troy against the Greeks. Hesiod calls him king of the Ethiopians. He was slain by Achilles. The Greeks in later ages confounded him with the Egyptian king Amenophis (Amen-hotep) III., whose colossal statue near Thebes excited their wonder by its vocal powers. It is the northernmost of two colossal sitting figures of black stone, in the approach to a temple now ruined, in the quarter of western Thebes called Memnonia by the Greeks. The height of each of these statues is 47 ft., and they rest upon pedestals about 12 ft. high. The upper half of the vocal Memnon was broken off and thrown down, but was afterward restored. On the lower part are 52 inscriptions in Greek and Latin (the earliest being dated A. D. 62), by the emperor Hadrian, the empress Sabina, and by several governors of Egypt and other travellers, official and private, testifying that they have visited the Memnon and heard his voice. The sound is said to have resembled the twanging of a harp string or the striking of brass, and it occurred at sunrise or soon after. Strabo, who visited it with Zellus Gallus, the governor of Egypt, says he heard the sound, but could "not affirm whether it proceeded from the pedestal or the statue itself, or even from some of those who stood near its base." He does not mention the name of Memnon, and it was not till after his time apparently that the Romans began to suppose the statue to be that of the son of Tithonus. The stone in the lap of the statue, when struck with a hammer, rings with a metallic sound; and as there is a square hole in the body just behind this, it is conjectured that the sound was produced by a person concealed therein. Another theory is that the sound was the effect of the expansion of this stone by the sun's rays, as a similar sound has been thus produced from one of the roof stones of the temple at Karnak.

MEMPHIS, a city, port of delivery, and the capital of Shelby co., Tennessee, situated in the S. W. corner of the state, on the Mississippi river, just below the mouth of Wolf river, on the fourth Chickasaw bluff, 780 m. above New Orleans, 430 m. below St. Louis, and 190 m. S. W. of Nashville; pop. in 1840, 3,360; in 1850, 8,841; in 1860, 29,023; in 1870, 40,226, of whom 15,471 were colored and 6,780 foreigners; in 1874, including suburbs, estimated by local authorities at 65,000. The bluff on which the city is built is about 35 ft. above the highest floods. The streets are broad and regular, and lined with handsome buildings. Many of the residences on the avenues leading from the river are surrounded with beautiful lawns. The city extends over three square miles. In the centre there is a handsome park, filled with trees, and containing a bust of Andrew Jackson. There are two theatres seating 800 and 1,000 persons respectively, and a building for the United States custom house is soon to be commenced. The principal of the six cemeteries is Elmwood, on the S. E. border of the city. Memphis is lighted with gas, is supplied with water on the Holly system, and has about 20 m. of street railways. It is the largest city of Tennessee, and the principal place on the Mississippi between St. Louis and New Orleans, and has a very extensive trade with Arkansas, Mississippi, W. Tennessee, and N. Alabama. Railroad facilities are afforded by the Memphis and Charleston, Mississippi and Tennesee, Louisville and Nashville and Great Southern, Memphis and Little Rock, and Memphis and Raleigh lines, while the Memphis and Paducah railroad is completed for 40 m. The Memphis and Little Rock line terminates at Hopefield on the Arkansas side of the Mississippi, whence a powerful transfer boat conveys an entire train at once to Memphis. Lines of steamers run to St. Louis, Cincinnati, Vicksburg, Napoleon, Ark., and to the Arkansas, White, and St. Francis rivers. The receipts of cotton in 1870-71 were 511,452 bales; in 1871-2, 380,958; in
MEMPHIS

1872-'3, 415,255; in 1873-'4, 429,327. The yearly sales of actual cotton in the Memphis market rank it second in importance in the United States. The annual value of the trade of the city is about $68,000,000, viz.: cotton, $32,000,000; groceries and western produce, $12,500,000; dry goods, clothing, boots and shoes, and miscellaneous merchandise, $15,000,000; home manufactures, $3,500,000. The principal manufactories are five large foundries and machine shops, with several smaller ones, extensive wood works, a tobacco factory, a furniture factory, and three of the largest oil mills in the United States, consuming about 500,000 sacks of cotton seed annually, and producing nearly $1,000,000 worth of cotton-seed oil, oil cake, and reginned cotton. The number of vessels belonging to the port on June 30, 1873, was 32, with an aggregate tonnage of 5,788.
